## CHAPTER 1 INTRODUCTION AND OVERVIEW

ACER was appointed by the Australian Curriculum, Assessment and Reporting Authority (ACARA) to undertake the central analyses of test data for the National Assessment Program – Literacy and Numeracy (NAPLAN) 2017 administration. In May 2017, the NAPLAN 2017 tests were administered nationally to all students in Years 3, 5, 7 and 9. As in previous cycles of NAPLAN, students at each of these year level were assessed in five domains: Reading, Writing, Language Conventions (Spelling, Grammar and Punctuation) and Numeracy. Students at the same year level were administered the same paper-based test for each domain.

NAPLAN results are reported using five national achievement scales, one for each of the assessed aspects of literacy – Reading, Writing, Spelling, and Grammar and Punctuation – and one for Numeracy. Each NAPLAN achievement scale spans Years 3, 5, 7 and 9 with scores that range from 0 to approximately 1000. There are also ten proficiency bands that span Years 3, 5, 7 and 9. Each year level is reported against six of these bands.

As in the previous two years, the central analyses were carried out in two stages. The first stage involved item and test analyses, test calibrations and equating of the 2017 tests onto the historic NAPLAN reporting scales for each domain. This was to ensure that NAPLAN results were comparable across cycles. The equating was achieved using data collected by administering the secure equating tests (which had already been scaled onto the NAPLAN historic scale) and the 2017 NAPLAN tests to a sample of Australian students. The equated reporting scale information with score-equivalence tables for the tests and cut points for proficiency bands provided necessary information for the jurisdictions to report to parents and schools.

The second stage involved analyses of the full cohort data that informed national reporting. The analyses provided performance results to ACARA for the preparation of the NAPLAN 2017 summary (preliminary) information released in August, the NAPLAN 2017 National Report released in December, and for other reporting.

Over one million students in Years 3, 5, 7 and 9 in all states and territories of Australia participated in NAPLAN 2017. Test data based on student responses were delivered to ACER from the jurisdictional Test Administration Authorities. There were eight sources of data from the national testing corresponding to the eight states and territories of Australia.

The main aim of this technical report is to describe and document the methodology used in the central data analyses of NAPLAN 2017 in producing reports on the performance of students on NAPLAN 2017. This includes description of methods for test calibration, test equating, scaling and in the estimation of performance results. Chapter 2 of this report describes the NAPLAN 2017 test design. Chapter 3 gives a summary of the methodology used in sampling for equating and calibration, and presents the participation rates. Chapter 4 describes the analysis procedure and the methodology of scaling and equating. Chapter 5 describes the data preparation process, test calibration outcomes and differential item functioning (DIF) analysis outcomes. Chapter 6 describes the test equating processes to place the NAPLAN 2017 tests on the NAPLAN historic scales. Chapter 7 describes the generation of proficiency estimates, scale transformation procedures and the methodology used for reporting of NAPLAN 2017 performance.

The student performance results are reported in the 2017 NAPLAN National Report which can be found at <http://www.nap.edu.au/results-and-reports/national-reports>

## CHAPTER 2 NAPLAN TEST DESIGN

Four tests were administered at each of Years 3, 5, 7 and 9. The four tests were reading, writing, language conventions (spelling, grammar and punctuation) and numeracy. The test results were reported in five domains: reading, writing, spelling, grammar and punctuation and numeracy.

In reading, language conventions and numeracy, there was a mix of multiple-choice items and constructed-response items. The multiple-choice (MC) items were presented in a standard format with a number of possible answers (usually four) from which students were required to select the best answer. The constructed-response (CR) items generally required a numeric answer, a word or a short phrase. All MC and CR items were dichotomously scored (correct or incorrect).

Year 3 and Year 5 numeracy tests consisted of 36 and 42 items, respectively. The use of calculators was not permitted in the numeracy tests in Years 3 and 5. Each of the Year 7 and Year 9 numeracy tests consisted of 48 items where in both year levels, the use of calculators was permitted in 40 of the items but not in 8 of the items.

Table 2.1 to Table 2.4 provide information on the structure of each of the numeracy, reading, spelling and grammar and punctuation test domains in Years 3, 5, 7 and 9.

**Table 2.1. Structure of Year 3 Test Domains, NAPLAN 2017**

Domain	Strand	Number of MC Items	Number of CR Items	Total for Strand	Total in Test
Reading	Literacy	30	0	30	37

	Statistics and Probability	6	2	8	

For writing, all students were required to write a persuasive text in 2017. Students from Years 3 and 5 responding to one writing prompt, while students in Years 7 and 9 responded to a different prompt. The scripts were rated based on the same ten criteria (Criteria 1 to 10) across all four year levels. Each of these ten criteria was rated polytomously. The ratings on the ten criteria were treated as data on ten different items. The ten criteria with the associated number of score categories are listed in Table 2.5.

**Table 2.5. Criteria and Score Categories for Writing, Years 3 to 9, NAPLAN 2017**

<b>Item</b>	<b>Criterion</b>	<b>Score Categories</b>
1	Audience	0-6
2	Text Structure	0-4
3	Ideas	0-5

8	Sentence Structure	0-6
9	Punctuation	0-5
10	Spelling	0-6
Raw Score Range		0-48

## CHAPTER 3 SAMPLING DESIGN FOR STAGE-1 ANALYSES

### 3.1 Overview

As with earlier NAPLAN administrations, data based on a scientific sample drawn from all states and territories were used for the purpose of test calibrations and scaling, for equating and for generating preliminary estimates of key national outcomes to be used on parent reports. This approach enabled results to be delivered to jurisdictions in time for reporting to schools and parents. It also provided jurisdictions with preliminary estimates of the final national outcomes some time before the full census data were made available.

There were three sampling activities associated with the NAPLAN 2017:

- The National Scientific Sample (also referred to as National Calibration Sample)
  - This was a sample of students who participated in the NAPLAN assessments that was used for generating estimates of the key national outcomes to be used on parent reports and for the estimation of preliminary NAPLAN 2017 results on the existing NAPLAN scale.
- The Item Calibration Sample – This was a sub-sample of the National Calibration Sample that was used for test calibrations and scaling.
- The Equating Sample – This sample was required for equating the 2017 tests onto the historic NAPLAN reporting scales. As in earlier administrations, a common-person equating method was used. Secure equating forms, which had been previously equated onto the NAPLAN reporting scales, were administered to students in this equating sample in addition to the NAPLAN 2017 tests.

As a contractor for the Australian Curriculum, Assessment and Reporting Authority (ACARA), Educational Measurement Solutions (EMS) worked with documentation from the previous technical vendor (Australian Council for Educational Research (ACER)) and information from ACARA to create the sampling procedures used for the NAPLAN 2017 administration.

Documentation for calculating the sampling weights can be found in an ACER report included in Appendix G of the 2012 NAPLAN Technical Report. This appendix provides:

- A description of the source data files that are used to create the sampling weights.
- The steps used for preparing the data.
- The calculation procedure for the sampling weights including adjustments for post-stratification and student-non-response.
- The procedure for checking and assigning weights to the National Calibration Sample file.
- The procedure for calculating the response rates.

Appendix A provides the NAPLAN 2017 EMS Sampling Report and describes:

- The development of the sample frames for the National Scientific and Equating

Samples including the steps used in data preparation and the creation of primary and secondary samples based on grade levels.

- The details of the explicit and implicit stratification used and the selection of schools.
- The procedures employed for using replacement schools when the schools originally selected for the sample did not participate.

The appendix also provides details on the sample frame and sampling parameters used in the NAPLAN 2017 administration.

The remainder of this chapter presents tables describing main aspects of the 2017 National Scientific Sample and the Equating Sample. These tables include the numbers of schools and students sampled, the assessment participation rates and the distributions of gender, language background (LBOTE), Indigenous status and geolocation by year level.

### 3.2 The National Calibration Sample

Table 3.1 lists the numbers of schools and students included in the National Scientific Sample from each of the eight jurisdictions. The table shows both the numbers of students (N) who were selected in the sample, as well as the numbers of students (Wtd. N) represented by the samples after sampling weights had been applied to approximate the full population of students who had taken the NAPLAN 2017 tests.

**Table 3.1. Numbers of Schools and Students included in the National Scientific Sample by State/Territory and Year Level (2017)**

Year Level	Source	NSW	VIC	QLD	WA	SA	TAS	ACT	NT	Total
Year 3	Schools	47	48	46	45	44	30	20	24	304
	Students (N)	1982	2007	2315	1759	1650	911	1127	630	12381
	Students (Weighted N)	101810	80582	73374	35677	22644	6997	5741	4167	330992

	Students (N)	5634	5636	5435	5185	1288	2408	2520	483	28589
	Students (Weighted N)	90541	72625	67702	31770	20562	6355	5481	3803	298839
Year 9	Schools	48	44	48	45	46	30	17	16	294
	Students (N)	5372	5319	4988	4765	3920	2450	2488	480	29782
	Students (Weighted N)	90562	75040	68082	31677	21330	6847	5545	3892	302975
Total	Schools	191	185	189	179	175	120	74	81	1194
	Students (N)	14991	14914	14973	13577	8339	6645	7282	2232	82953
	Students (Weighted N)	379082	304221	279498	132860	85769	26817	22318	16156	1246721

The remainder of this section presents summary tables showing school and student participation in the sample and the distribution of the National Scientific Sample across key population subgroups.

Table 3.2 shows the percentages of schools from the original sampling list (i.e., without replacement schools) that were included in the National Scientific Sample for each jurisdiction by year level, and the inclusion rates when replacement schools were taken into account.

For each jurisdiction and year level, the school response rates before the use of replacement schools are calculated as

$$RR_s = P_s / (P_s + NP)$$

where  $RR_s$  is the response rate using sampled schools only,  $P_s$  is the number of sampled schools that participated and  $NP$  is the number of sampled schools that did not participate.

The school response rate after the use of replacement school is given by

$$RR_{sr} = P_{sr} / (P_{sr} + NP)$$

where  $RR_{sr}$  is the response rate using sampled schools and replacement schools,  $P_{sr}$  is the number of sampled or replacement schools that participated, and  $NP$  is the number of sampled schools that did not participate.

**Table 3.2. Percentage of Sampled Schools included in the National Scientific Sample (2017)**

Year Level	School Type	NSW	VIC	QLD	WA	SA	TAS	ACT	NT
Year 3	Sampled Schools	96	88	94	100	100	100	95	88
	Sampled and Replaced Schools	96	89	94	100	100	100	95	89
Year 5	Sampled Schools	98	83	98	98	98	100	100	88
	Sampled and Replaced Schools	98	85	98	98	98	100	100	88
Year 7	Sampled Schools	100	75	100	98	97	97	100	88
	Sampled and Replaced Schools	100	80	100	98	98	97	100	89
Year 9	Sampled Schools	100	71	100	98	95	97	100	82
	Sampled and Replaced Schools	100	76	100	98	96	97	100	83

Table 3.3 to Table 3.6 present the overall student participation rates obtained by aggregating students across all of the schools within the National Scientific Sample. These participation rates are reported by state/territory and by domain for each year level. Besides students who were *present* for testing, several other categories are shown and defined as follows:

- *Absent* students are students who did not take the test because they were not present when the test was administered, and are identified as absent by the school for the purpose of the test session (ACARA, 2017a, p. 10);
- Students may be labelled *exempt* from one or more of the tests on the basis of English language proficiency or significant disabilities as attested by parents/carers (ACARA, 2017a, p. 9);
- Students may be *withdrawn* from the testing program by their parent/carer for such reasons as religious beliefs or philosophical objections to testing (ACARA, 2017a, p. 11);
- The *other* category includes sanctioned abandonment of the test due to injury and illness (ACARA, 2017a, p. 11) and verified by the Test Administration Authority (TAA).

**Table 3.3. Year 3 Sample: Overall Participation Category Rates (%) by State/Territory by Domain (2017)**

Table 3.7 to Table 3.10 shows the overall distributions of the National Scientific Sample by several student-level and school-level demographic variables by year level and jurisdiction. The definitions of these variables are taken from the *National Assessment Program – Literacy and Numeracy Achievement in Reading, Writing, Language Conventions and Numeracy: National Report for 2017* (ACARA, 2017b):

- Sex is the distinction ‘male’ and ‘female’ as reported on a student’s enrolment record (p. viii).
- A student is classified as *language background other than English* (LBOTE) if either the student or parents/ guardians speak a language other than English at home (p. vii).
- A student is considered to be *Indigenous* if he or she identifies as being of Aboriginal and/or Torres Strait Islander origin. The term ‘origin’ is considered to relate to a person’s Australian Aboriginal or Torres Strait Islander descent and for some, but not all, their cultural identity (p. vii).
- The *geolocation* of a school uses the ABS Australian Statistical Geography Standard (ASGS) Remoteness Structure which is based on the locality of individual schools and is used to disaggregate data according to Major Cities of Australia, Inner Regional Australia, Outer Regional Australia, Remote Australia and Very Remote Australia (p. vii).

## CHAPTER 4 ANALYSIS PROCEDURES AND METHODOLOGY

This chapter describes the processes and methodologies used in the NAPLAN 2017 central analysis. The psychometrics and scaling methods used are methods that have been widely utilised in many large scale assessment programs, including the *Programme for International Student Assessment* (PISA).

The NAPLAN 2017 test calibrations were based on the Item Calibration Sample. The equating to the NAPLAN scale was based on the Equating Sample. The National Scientific Sample was used for the estimation of preliminary NAPLAN 2017 results in July. These estimates were used on parent reports. The analyses for national reporting were based on full cohort data.

The NAPLAN program uses multidimensional item response model with latent regression (MDLR) to produce the plausible values (PVs) required for the analysis and reporting of NAPLAN results at the national and jurisdictional level. The PVs are generated using the ACER *ConQuest* software. PVs were generated based on the National Scientific Sample for the estimation of preliminary results in July, on stage-1 census data for the estimation of summary results released in August and on stage-2 census data for the full national report released in December.

### 4.1 Data Collection and Data Delivery

Data collection was undertaken by the Test Administration Authorities (TAAs) in the jurisdictions. There were three rounds of data delivery for the central data analysis and a final round for the preparation of national report. The first round involved delivery of data from the equating samples and the second round involved the delivery of the national scientific samples, both described in Chapter 3. The third round involved delivery of nearly complete stage-1 full cohort NAPLAN test data of Years 3, 5, 7 and 9 students in mid July 2017. These data were used for the generation of the NAPLAN 2017 national summary information. The complete set of full cohort data used in the production of the national report was delivered in September 2017. With each round of data delivery, the datasets were cleaned and recoded in preparation for analysis. A systematic process involving data checking was used to ensure that each dataset was consistent with national code frames and data dictionaries.

### 4.2 Scaling Model

Test calibration and scaling was performed based on the Rasch model, as was the case in previous administrations.

For multiple-choice items and constructed-response items with a category score 1 for correct responses and 0 for incorrect responses, the Rasch model predicts the probability of a correct response given the latent trait ( $\theta_n$ ) and the item difficulty or location ( $\delta_i$ ). This is modelled as

$$P_i(1|\theta) = \frac{\exp(\theta_n - \delta_i)}{1 + \exp(\theta_n - \delta_i)}$$

where  $P_i(1|\theta)$  is the probability of person  $n$  to score 1 on item  $i$ .  $\theta_n$  is the estimated latent trait of person  $n$ , and  $\delta_i$  the estimated location of item  $i$  on this dimension. For each item, responses are modelled as a function of the latent trait  $\theta_n$ .

In the case of items with more than two categories, this model can be generalised to the Partial Credit Model (Masters, 1982) as

$$P(x|\theta) = \frac{\exp \sum_{j=0}^x (\theta_n - \delta_i + \tau_{ij})}{\sum_{h=0}^{m_i} \exp \sum_{j=0}^h (\theta_n - \delta_i + \tau_{ij})} \quad x = 0, 1, K, m_i$$

where  $P(x|\theta)$  is the probability of person  $n$  to score  $x$  on item  $i$ .  $\theta_n$  denotes the person's latent trait, the item parameter  $\delta_i$  gives the location of the item on the latent continuum, and  $\tau_{ij}$  is a step parameter.

It should be noted that both item (difficulty) and person (ability) parameters are measured on the same scale: in the case of dichotomous items with just two categories (correct and incorrect), for students who have ability ( $\theta_n$ ) the same as the estimated difficulty parameter of an item ( $\delta_i$ ), the probability of giving a correct response is 0.5.

### ***Software used for analyses***

For data checking, data management and calculations of sample statistics, statistical software packages SPSS and SAS were used. For the Rasch scaling analysis, the software *ACER ConQuest* (Wu, Adams, Wilson, and Haldane, 2007) was used. *ACER ConQuest* provides tools for the estimation of a variety of item response models and regression models. It was used for test calibrations, for generating weighted likelihood estimates (WLE) for the score-equivalence tables and for drawing plausible values (PVs) based on a multidimensional item response model with latent regression. In addition, score-equivalence tables obtained from *ACER ConQuest* were cross-checked with those obtained from ACER Quest (Adams and Khoo, 1996).

## **4.3 Stage One Analyses Based on Item Calibration Sample and Equating Samples**

### ***Sequence of analyses***

Analyses were undertaken in the following order:

- Item and test analyses based on item calibration sample data (treating ‘not reached’ items as ‘not administered’ to obtain appropriate estimates of item difficulty). No weights were used.
- A check of item characteristics using classical statistics such as item facilities ( $p$ -values) and distractor analysis. A review of the outcomes of Rasch analyses including checks of item fit, item spread, test targeting, and differential item functioning (DIF) analysis.
- Horizontal equating using the equating data.
- Vertical equating based on common items in tests of adjacent year levels (Year 3 and Year 5, Year 5 and Year 7, Year 7 and Year 9).
- The combination of results from the horizontal and vertical equating for putting each 2017 domain scale onto the NAPLAN domain scale.

- The generation of student weighted likelihood estimates (WLE) to obtain score equivalence tables.
- The transformation of logit scores into NAPLAN reporting scale scores.
- The generation of plausible values for the national scientific sample.
- The analyses to obtain preliminary results on the NAPLAN scale based on the national scientific sample data. Student weights were used in the calculations of preliminary statistics.
- The calculation of standard errors for student summary statistics that took into account sampling, measurement, and equating errors.

### ***Item coding***

The recoding of test data was done prior to data analysis.

In 2017, data for multiple-choice items were indicated by the letter of the chosen response option for each item, i.e., A, B, C, D, or E. Responses for students not participating on a particular test were recoded to Rs and treated as missing. Multiple responses (7s) were treated as incorrect. Embedded missing responses were coded as 9 by the TAAs and treated as incorrect. Trailing missing responses were also coded as 9 for the first unanswered item and treated as incorrect, while the remaining trailing missing items were recoded as Ms and treated as “not reached”. These not-reached items were treated as missing values for item calibration to obtain an appropriate estimate of the item difficulty (for students who had a chance to respond).

However, these omits were treated as incorrect for the final estimation of student abilities.

Data for partial-credit items were indicated by ordered categories starting with 0 up to the maximum possible value. Short-answer items were given scores of 0 or 1. The rules for data recoding are provided in Table 5.1 in the next chapter.

### ***Item calibration***

The outcomes of the Rasch analyses, including item and test characteristics, are provided in Chapter 5 and Appendices C and D. The goodness of fit for individual items was based on the Mean Square Statistics. The statistical information regarding item characteristics provided includes:

- Item facility, expressed as percentage correct for each relevant year level.
- Item location on individual year level scales.
- Test targeting and item spread.
- Information about the fit of the item to the Rasch model specified.
- Plots for assessing potential differential item functioning (DIF).
- Information on the consistency of the functioning of link items between adjacent year levels.

### ***Review of test and item characteristics***

*ACER ConQuest* provides statistics for each individual item in tabular form with statistics for response categories. The information provided includes the number of students taking the test item, item discrimination (which is equivalent to the correlation between the correct item category and the corrected total score), the item difficulty parameter and the weighted mean square (Infit) fit statistic. Other information provided in the tables includes scoring for each category (responses and other codes, such as missing or not reached), the number and percentage of students in each category, the point biserials for each category (correlation with the corrected total score) and their *t*-values, as well as the average ability estimates of students in each category and their standard deviation. These statistics were used for item review in conjunction with the item characteristic curves (ICC), which show the modelled and empirical curves and distractor behaviours for multiple-choice items. Distractor curves were studied for problem items. This process is described in greater detail in Chapter 5.

In the calibration for each test, the item difficulties and the distribution of student abilities were presented on the same scale. These can be examined visually in the item variable maps provided by *ACER ConQuest*. The reliabilities of the NAPLAN 2017 tests are reported in Chapter 5.

### ***Differential Item Functioning Analysis***

*Differential item functioning* (DIF) occurs when an item is substantially harder for one group than for another group after their relative performance in the domain tested has been taken into account.

A general problem of DIF analysis is to determine the point below which differences are not significant. With large sample sizes, most of the differences will appear to be statistically significant but may not be of practical importance or substantial in size. Under such circumstance, rules of thumb were used to determine whether there was substantial DIF present for a particular subgroup.

DIF in the test items was examined for gender, LBOTE and Indigenous groupings. With five domains and four year levels for each of the three subgroup pairs (for writing, four year levels were analysed together), a decision was made to first examine DIF in the subgroups using scatter plots of adjusted item parameters. Separate Rasch calibrations were performed over the same set of items for the subgroups. The mean item difficulty in each of the two independent sets of item parameters was centred at zero. One set of item parameters was then plotted against the other set of item parameters. Each item is represented by one point on the plot. A diagonal line was plotted as the reference line. If the relative item difficulty for an item is the same in the two groups after taking their relative performance on the test into account, the point representing the item will be on the diagonal. The further the distance that point is from the diagonal, the larger will be the size of the DIF.

DIF was also examined using *ACER ConQuest* by analysing the data based on a multi-facet model by adding an item-by-subgroup term.

In addition to the DIF analysis of student subgroups, item differential functioning across jurisdictions was also examined. The results are shown in section 5.6.

### ***Vertical reporting scales***

NAPLAN reporting in each of the five domains is based on a vertical reporting scale spanning Years 3, 5, 7 and 9 for that domain. Each year the scales have been used by jurisdictions to report to parents and schools and for national reporting of student performance on the NAPLAN tests. The NAPLAN 2017 tests were equated onto each NAPLAN domain scale through a combination of vertical equating across the year levels and horizontal equating to the historic scale.

#### *Reading, Spelling, Grammar and Punctuation, and Numeracy*

Each of the reading, spelling, grammar and punctuation, and numeracy vertical preliminary scales across Years 3, 5, 7 and 9 was constructed and equated to the NAPLAN vertical scale established in 2008. The equating was performed through: horizontal test equating based on the equating sample data; and vertical equating using linking items embedded in the 2017 tests of adjacent year levels (Year 3 and Year 5, Year 5 and Year 7, Year 7 and Year 9), based on the 2017 calibration sample data. Specifically, the transformation needed for each domain score was calculated based on the equating constants determined from the horizontal and vertical equating in combination. The methodology and results of the equating are described in Chapter 6, and scale transformations are described in Chapter 7.

#### *Writing*

In 2017, while students in Years 3 and 5 responded to one prompt for the writing assessment, students in Years 7 and 9 responded to another. The resulting scripts were rated using ten criteria. The data from all four year levels were analysed concurrently to construct the vertical writing scale. The writing analysis was based on the Partial Credit model, a polytomous extension of the Rasch model. The equating of the 2017 writing scale to the 2015 writing scale was conducted using the pairwise-comparison method. The results were checked against those from the common-item equating method. The results of the equating are discussed in Chapter 6. Appendix B provides details of the pairwise-comparisons.

#### *Scoring*

The raw scores for each student on the five domains were calculated. Omitted responses were scored as being incorrect. Score-equivalence tables based on WLEs in logits were generated for each test in each domain based on delta-centred item parameters. Transformations were applied to the logit scores for conversion to NAPLAN reporting scale scores on the historic NAPLAN scales.

The jurisdictions were provided with the transformed score-equivalence tables for rapid generation of student and school reports. The score-equivalence tables provided the means for Test Administration Authorities to locate individual students on year level specific reports using the raw scores for each test.

For the estimation of population statistics, rather than using the WLE estimates, five sets of PVs of student latent proficiency estimates were drawn using *ACER ConQuest* based on imputation techniques and a multidimensional item response model with latent regression for students in each of the year levels for each of reading, spelling, grammar and punctuation and numeracy. The conditioning variables used were gender, LBOTE status, Indigenous status, school sector, geolocation, parents' education and occupation and school WLE reading mean.

In generating PVs based on the National Scientific Sample for preliminary estimation of national results in July, jurisdiction was also included as a conditioning variable. The plausible values for writing were drawn for Years 3, 5, 7 and 9 concurrently, conditioning on year level, and the school WLE writing mean was used in the conditioning instead of the reading mean. For each student, the school mean was calculated excluding that particular student. The conditioning on background variables increases the precision of population estimates and allows the analysis of relationships between proficiency estimates and background variables. Plausible values were drawn for all students (including absent students and withdrawn students) except for students who were exempt from NAPLAN testing.

### ***National NAPLAN Reporting Scales and Proficiency Bands***

A linear transformation was applied to the logit scores in each domain. The transformation for each domain score was based on standardisation procedures established in 2008 and the equating constants and scale factors estimated from the horizontal and vertical equating, with the result that all five domain scales were put on the NAPLAN historical scales. These scales share the same set of cut-points separating the bands. The cut-points in scale scores established for NAPLAN 2008 were used in 2009 through 2017 to ensure comparability of results across time.

### ***Preliminary performance information based on the National Scientific Sample***

For reporting to parents, the national means, standard deviations, the 20th percentiles and the 80th percentiles for each domain and each year level were calculated using the 2017 National Scientific Sample, with weights applied. Preliminary percentages in bands were also estimated for each domain and each year level. All the statistics obtained were expressed on the NAPLAN Reporting Scales.

## **4.4 Stage Two Analyses Based on Census Data**

Using item parameters and scaling information as described in the stage one analyses, five sets of plausible values were drawn separately for each jurisdiction, based on a multidimensional item response model with conditioning on background variables for students in each of the year levels in each of the domains. The conditioning variables used were as described in section 4.3. Census data were analysed to produce national and jurisdiction results, on the full cohort for national reporting in August and in December. The National Report released in December also include results on subgroups.

## **4.5 The Estimation of Standard Errors**

NAPLAN results from census data were reported with standard errors that included both measurement errors and sampling errors. The inclusion of sampling error might be considered surprising in that all students in the target year levels were included in the assessment.

However, the aim of NAPLAN is to make inference about the educational systems each year and not about the specific student cohorts in 2017. In addition, even in census assessments there is a certain amount of non-response that must be taken into account.

The measurement errors are estimated using the multiple sets of plausible values. In general, secondary analyses with plausible values can be described as follows. If  $\theta$  is the population parameter and  $\theta_i$  is the statistic of interest computed on one set of plausible values, then:

$$\theta = \frac{1}{M} \sum_{i=1}^M \theta_i, \text{ with } M \text{ being the number of sets of plausible values.}$$

The plausible values also allow the computation of the uncertainty in the estimate of  $\theta$  due to the lack of precision of the test. If a perfect test could be developed, then the measurement error would be equal to zero and the five statistics from the plausible values would be exactly identical. Since no test is perfect, the five sets of statistics would not be identical. The measurement variance is estimated as:

$$B_M = \frac{1}{M-1} \sum_{i=1}^M (\theta_i - \theta)^2$$

It corresponds to the variance of the five plausible value statistics of interest. The final stage is to combine the sampling variance and the imputation variance as follows:

$$V = U + \left(1 + \frac{1}{M}\right) B_M, \text{ with } U \text{ being the sampling variance.}$$

Sampling error was considered at both the student and the school level. At the student level there is a random element from one year to another in respect of having different age cohorts at each year level. At the school level it needs to be considered that schools may be closed from one year to another or new schools may be opened.

The Taylor Series Linearization method (Wolter, 1995; Levy and Lemeshow, 1999) was used to construct an approximation to the functional form of the estimated population characteristic that is a linear function of the original observations and hence is amenable to construction of a variance estimator.

The process of *linearization* or *Taylor series variance estimation* involves several steps. To look at a simple case, consider a population characteristic  $\theta$  and assume that there exists an estimator  $\hat{\theta} = f(x, y)$  such that the variables  $x$  and  $y$  are linear functions of the sample observations but that  $f(x, y)$  is *not* a linear function of the sample observations. The next step is to use a first-order Taylor series to approximate  $f(x, y)$ . This results in an approximation that is linear in the variables  $x$  and  $y$ , and hence, linear in the sample observations. The final step is to take this linear approximation, identify the sample design, and apply the design-based formula to estimate the variance (Levy & Lemeshow, 1999).

Taylor series variance estimation can be done using commercially available statistical software. For NAPLAN 2017, the complex sample module implemented in the SPSS software package and the procedure *Proc Surveymeans* in the SAS software package were used in parallel processing for checking. Macros were written in both SPSS and SAS to combine the estimates of sampling error with the estimates of measurement error to obtain final standard errors for the performance statistics reported for the census data. The standard errors were used to determine statistical significance in mean differences in NAPLAN 2017 performance in the reports.

Two additional sets of standard errors were calculated, one set for the comparisons of means across 2008 (the baseline year) and 2017 for reading, spelling, grammar and punctuation and numeracy tests and across 2011 (the baseline year) and 2017 for writing, and one set for the comparisons of means across 2016 and 2017. These took into consideration, in addition to sampling and measurement errors, the errors due to the equating of measurement scales across years. See section 6.6 for a discussion of the estimation procedure used to calculate the standard errors of equating.

### ***The calculation of effect size for census data***

All significance testing is accompanied by an effect size measure, which indicates the magnitude of any change. The effect size for differences in means is given by *Hedge's g*, whose formula is:

$$g = \frac{m_2 - m_1}{s_p}$$

where  $m_1$  is the sample mean of the first group,  $m_2$  is the sample mean of the second group, and  $s_p$  is the pooled standard deviation, i.e. the square root of the pooled within-groups variance, weighted by number of cases in each group

$$s_p = \sqrt{\frac{(n_1 - 1)s_1^2 + (n_2 - 1)s_2^2}{n_1 + n_2 - 2}}$$

where  $n_1$  and  $n_2$  are the number of cases in group 1 and 2, respectively, and  $s_1^2$  and  $s_2^2$  are their variances. This formula is known to yield a biased estimate for the population value and is corrected using the following formula:

$$g_{unbiased} = g_{biased} \left[ 1 - \frac{3}{4(n_1 + n_2 - 2)} \right]$$

## CHAPTER 5 TEST CALIBRATIONS

This chapter describes the data preparation process, test calibration outcomes and differential item functioning (DIF) analysis outcomes.

### 5.1 Data Preparation

As in previous years, each TAA prepared its jurisdiction data according to a common codebook provided. Each TAA prepared four data files in ASCII format, one for each year level. The data files were uploaded to ACARA's secure File Transfer Protocol (FTP) site. The data were identified at the school level and delivered with school information necessary for the calculation of weights. This made it possible for the data analysis contractor to calculate the weights for each school and for each jurisdiction.

#### *Data Checking*

All data files were checked for invalid codes and inconsistencies. Data were cleaned and recoded as part of the central data analysis process. Any concerns about data were communicated to the TAA and rectified as necessary. Recoded data files were generated and verified in preparation for data analysis.

#### *Rules for Data Recoding*

Table 5.1 lists the test participation codes used in the data files and the rules for recoding the response string for each test.

**Table 5.1. Rules for Data Recoding**

Participation Code	Data Recoding Rule
P – Present	Data string (i.e. item responses) expected. Any embedded missing responses are indicated with 9s by the TAA, invalid responses with 7s. The first trailing missing response is to be kept as a 9; subsequent trailing-missing responses are unreached missing responses, and are to be recoded as Ms. Any embedded missing responses within the data string are kept as 9s.
A – Absent	Students who are present but do not attempt any question will have a string of Ms. A data string of all 9s for that test was expected from the TAA. Item data are recoded as a string of Rs.
S – Sanctioned Abandonment	This is specifically used to indicate students who unexpectedly abandon the test due to illness or injury. See National protocols for Test Administration section 5.5.
W – Withdrawn	There may be data, but these students will be treated as absent. All item data are recoded as a string of Rs.
E – Exempt	A data string of all 9s for that test was expected from the TAA. See National protocols for Test Administration section 5.4.
	These students are treated as absent. Item data are recoded as a string of Rs.
	A data string of all 9s for that test was expected from the TAA. See National protocols for Test Administration section 5.2.
	These students are not included in the calibration or in the calculation of means. Item data are recoded as a string of Rs.

Language conventions was one test but reported as two domains. There were students who attempted only the spelling part or only the grammar and punctuation part. For the purpose of calibration, the unreached-missing coding was done separately for spelling and grammar and punctuation. A code of 9 was only used for the first of the unreached missing response, and the remaining missing values were recoded to M. The code of 9 was also used for embedded missing responses.

Missing data were not expected for writing. Students who were present but did not write anything (blank booklet) had their ratings coded as a string of 9s by the TAAs. These were then all recoded to M.

## 5.2 Test Calibrations

Senate weights were not used for item calibration. To ensure each state/territory was equally represented, a simple random sample was drawn from each state/territory's scientific sample to match the sample size of the scientific sample of the smallest state/territory (Northern Territory). The reading, spelling, grammar and punctuation and numeracy tests were calibrated separately by domain and year level, resulting in 16 separate calibrations. In the estimation of parameters, all responses from a non-participating student (absent, withdrawn and exempt) were treated as missing, and the embedded missing response (9), the first trailing missing response (9) and the invalid response (7) were treated as wrong. Trailing missing responses (M) beyond the first were treated as missing. Senate weights were not used for item calibration. To ensure each state/territory was equally represented, a simple random sample was drawn from each state/territory's scientific sample to match the sample size of the smallest state/territory (Northern Territory).

In 2017, while students in Years 3 and 5 responded to one prompt for the writing assessment, students in Years 7 and 9 responded to another. The writing scripts were rated using the same marking rubric based on the ten criteria. The writing test data from Years 3, 5, 7 and 9 were analysed concurrently, based on the partial credit model. The latent distribution was conditioned on year level.

All calibrations were conducted using *ACER ConQuest*. In addition, calibrations were conducted independently using *ACER Quest* as a method of checking the calibration outcomes.

The *ACER ConQuest* item analysis results are in Appendix B. This is an item-by-item tabular display of classical item statistics: item facility, discrimination and point-biserial statistics, counts and percentages of each response option (for multiple-choice items), score-points (for scored items), Rasch item parameters and Infit mean square. The item parameters shown on these tables are delta-centred (i.e., the mean of item difficulties is set to zero) within each domain and year level, except for writing, where Years 3, 5, 7 and 9 are combined.

Traditional test reliability, Coefficient Alpha, is presented at the end of the item analysis results for each test.

The Rasch item parameter estimates and statistics are summarised in Appendix C for each of the 17 tests. The item parameters shown in these tables are delta-centred for each test. The 95% confidence interval for the expected value of the Infit mean square is also provided for each item.

Item Characteristic Curves (ICCs) for all items are shown in Appendix D. The ICC plot shows a comparison of the empirical ICC based on observations from ten equal-size ability groupings (broken line joining ten dots) and the expected model-based ICC (smooth line). The two curves should display small or no disparities for an item that has good fit to the model. Since the ICC for a multiple-choice item also shows the proportion of students in each of the ten groups who responded to each distractor in the distractor response curves, the performance of distractors can be examined using the item analysis results and the behaviours of the response curves in the ICC plots.

### **5.3 Test Reliability and Average Item Discrimination**

#### ***Test Reliability***

Table 5.2 shows the coefficient alpha of each test. It should be noted that the language conventions test is reported as two domains for each year level: (1) spelling and (2) grammar and punctuation with 25 items each. While spelling items are in a constructed response format, grammar and punctuation items are in a multiple-choice format for Years 3, 5 and 9 while Year 7 test include 2 constructed response items.

The coefficient alphas are between 0.84 and 0.89 for the reading tests, between 0.89 and 0.92 for the spelling tests, between 0.73 and 0.78 for the grammar and punctuation tests and between 0.87 and 0.93 for the numeracy tests. The reliability for the writing test is 0.96. The reliabilities are generally high with the exception of the reliabilities for the grammar and punctuation tests. The shorter multiple-choice tests may explain the slightly lower reliability for the grammar and punctuation tests.

**Table 5.2. Coefficient Alpha for NAPLAN 2017 Tests**

Year Level	Reading	Spelling	Grammar and Punctuation	Numeracy	Writing*
Year 3	0.84	0.92	0.73	0.87	
Year 5	0.86	0.92	0.74	0.90	
Year 7	0.89	0.90	0.78	0.91	0.96*
Year 9	0.88	0.89	0.73	0.93	

\*For Years 3, 5, 7 and 9 together

#### ***Average Item Discrimination***

Table 5.3 shows the average item discriminations for the reading, spelling, grammar and punctuation and numeracy tests. The average item discriminations for the reading tests range from 0.34 to 0.37. The spelling tests have the highest average item discriminations, ranging from 0.48 to 0.57. The averages for the grammar and punctuation tests are between 0.27 and 0.32, and those for the numeracy tests are between 0.37 and 0.45.

The unusually high average item discrimination (i.e., 0.82) for the writing test is likely due to the small number of highly correlated, polytomously scored criteria used in scoring across the span of grade levels.

**Table 5.3. Average Item Discrimination for NAPLAN 2017 Tests**

Year Level	Reading	Spelling	Grammar and Punctuation	Numeracy	Writing*
Year 3	0.34	0.57	0.29	0.37	
Year 5	0.37	0.54	0.29	0.41	
Year 7	0.36	0.48	0.32	0.40	
Year 9	0.35	0.48	0.27	0.45	0.82*

\*For Years 3, 5, 7 and 9 together

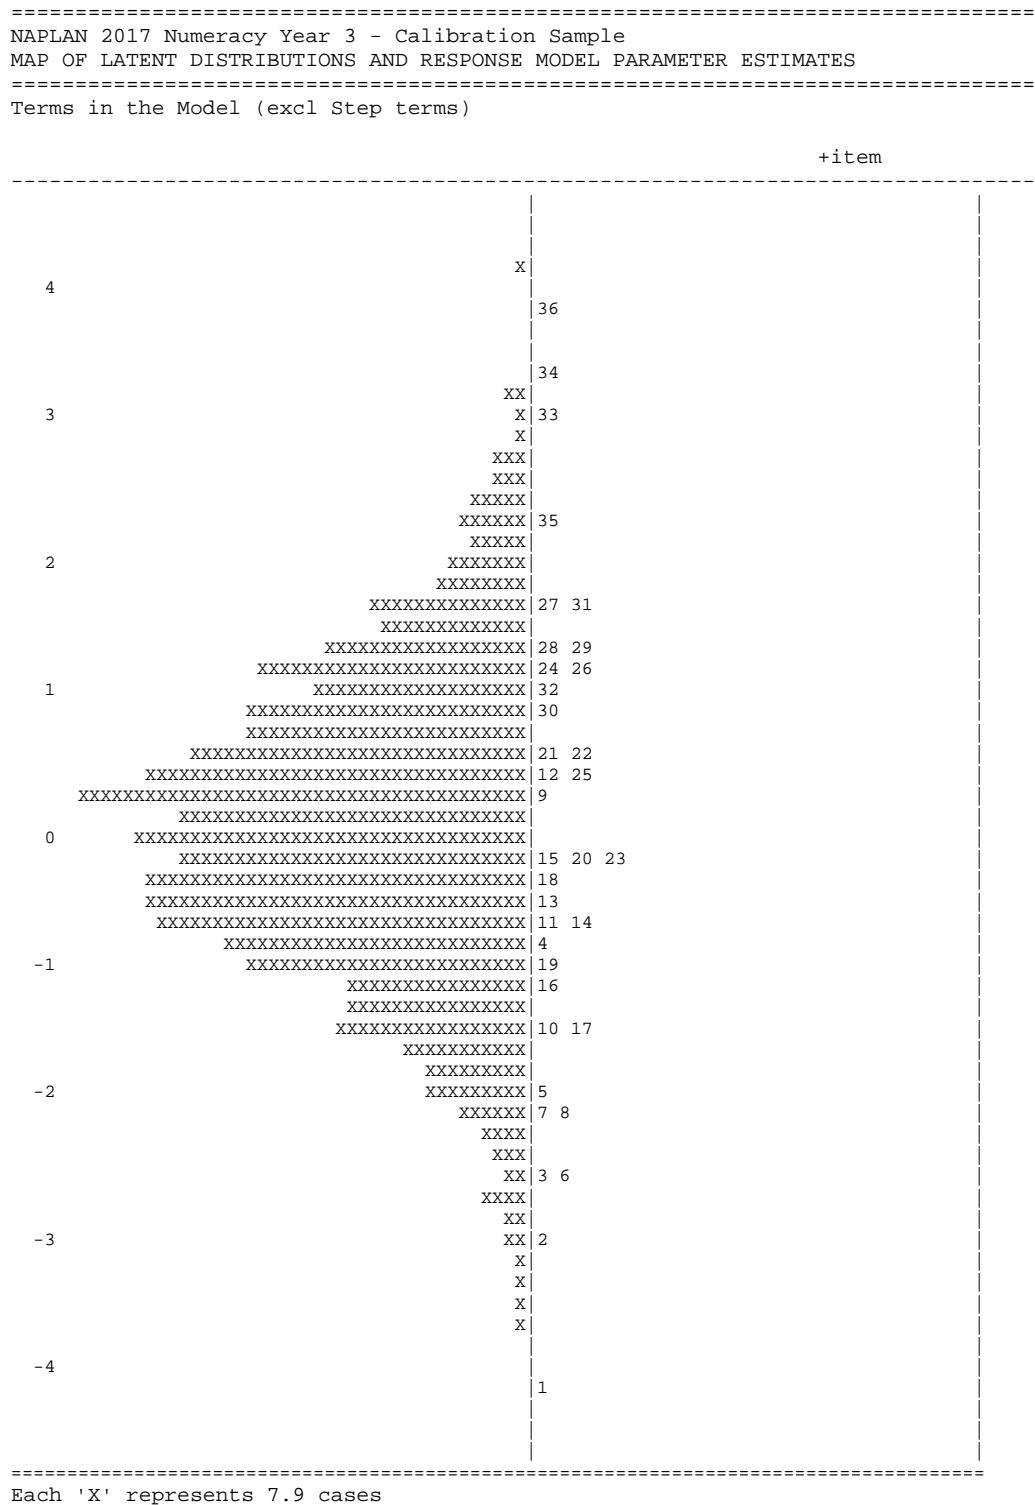

#### 5.4 Test Targeting and Item Spread

The purpose of the variable map (or Wright map) is to compare the distribution of student locations (on the left side of the map) and the item thresholds (on the right side of the map). Item, step and person parameters are plotted on a common scale on a variable map. Appendix E provides the variable maps for the domains at each year level.

For dichotomously scored tests, the maps are constructed so that a student has a 50% chance of answering an item correctly when the item is at a difficulty level that is at the same level as the student's ability. On each variable map, the mean of the item estimates was centred at zero. Students at the top end of the distribution have higher proficiency estimates, while items at the top end are the more difficult items.

Figure 5.1 displays the variable map for Year 3 numeracy. That variable map indicates that this sample's numeracy achievement level has been well targeted by the current test. The distribution of persons (each X represents approximately 8 persons) matches up well with the distribution of item thresholds, which indicates that the ability levels of the population were well represented at all levels of the test.

For the polytomously scored tests (e.g., writing), on the other hand, the criterion difficulty of each of the ten rating criteria is plotted in the middle panel with the latent ability distribution on the left-hand side. Each criterion is polytomously scored. The right-hand panel of Figure E.5 shows locations of the Thurstonian thresholds of each item. The notation  $a.b$  indicates threshold  $b$  of criterion  $a$ . The location of the threshold indicates the ability level required for a student to have 50% chance of achieving category  $b$  or better on criterion  $a$ . The variable maps show that the thresholds are well spread out and well separated.

**Figure 5.1. Example of a Wright map for Year 3 Numeracy**

## 5.5 Item Fit

The evaluation of goodness of fit to the Rasch model for individual items was based on the weighted mean square (Infit mean square) statistics. Infit compares the actual residuals to how much of the variation is expected if the data fit the model. A value greater than the expected value of 1.0 indicates that the item responses contain a greater amount of variability than expected by the model, and a value below 1.0 indicates that the consistency between observed data and model-based predictions is better than expected. We used an Infit value of 1.20 as the criterion value for evaluating the goodness of fit of each item, i.e., Infit values greater than 1.20 indicate item under-fit. We also calculated classical item statistics (i.e., discrimination and facility) for the purpose of item fit evaluation, specifying criterion values for discrimination (based on item-rest score correlation) less than 0.25 and facility outside the range of 0.10 to 0.90. Values of the Infit mean square and classical item statistics of each item can be found in Appendices B and C.

As mentioned in section 5.2., the ICC of each item shows a comparison of the empirical ICC based on observations from ten equal-size ability groupings (broken line joining 10 dots) and the expected model-based ICC (smooth line), and the two curves should display small or no disparities for an item that has good fit to the model. The ICCs for all items can be found in Appendix D.

### ***Reading, Spelling, Grammar and Punctuation, and Numeracy***

Item fit to the Rasch model was closely examined for reading, spelling, grammar and punctuation and numeracy at each of the four year levels. As all items were trialled and examined previously, few items should show misfit. Because of the large size of the calibration sample, the confidence intervals for the Infit mean squares were rather narrow.

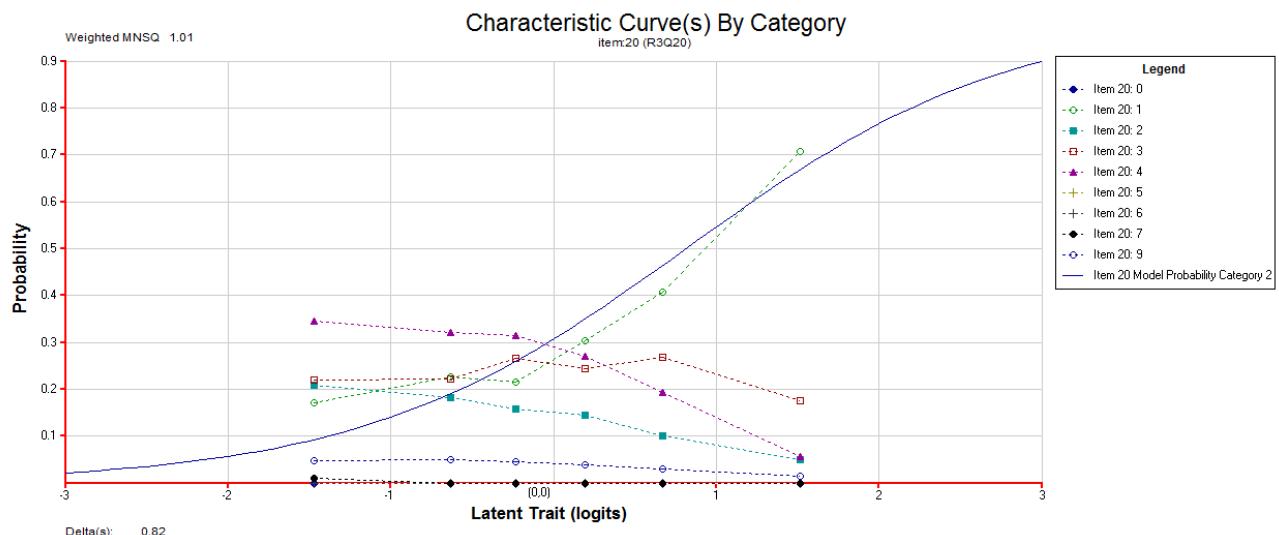

Table 5.4 presents the number of items falling into two Infit mean square ranges: less than or equal to 1.20, and greater than 1.20. It also presents the number of items with discrimination less than 0.25 and the number of items with facility outside the range of 0.10 to 0.90. As seen from the table, there were 14 items across 16 tests having Infit greater than 1.20. Regarding classical test statistics, there was a total of 57 items across the 16 tests with discrimination less than 0.25. There was a total of 39 items with facility higher than 0.90 and 15 items with facility less than 0.10. Figure 5.2 shows the ICC of one reading item (i.e., Item R3Q20) with an Infit statistic close to 1.01. In contrast, Figure 5.3 shows the ICC of one reading item (i.e., Item R5Q28) with an Infit statistic (i.e., 1.27) higher than the criterion value (i.e., 1.20) for evaluating the goodness of fit of each item.

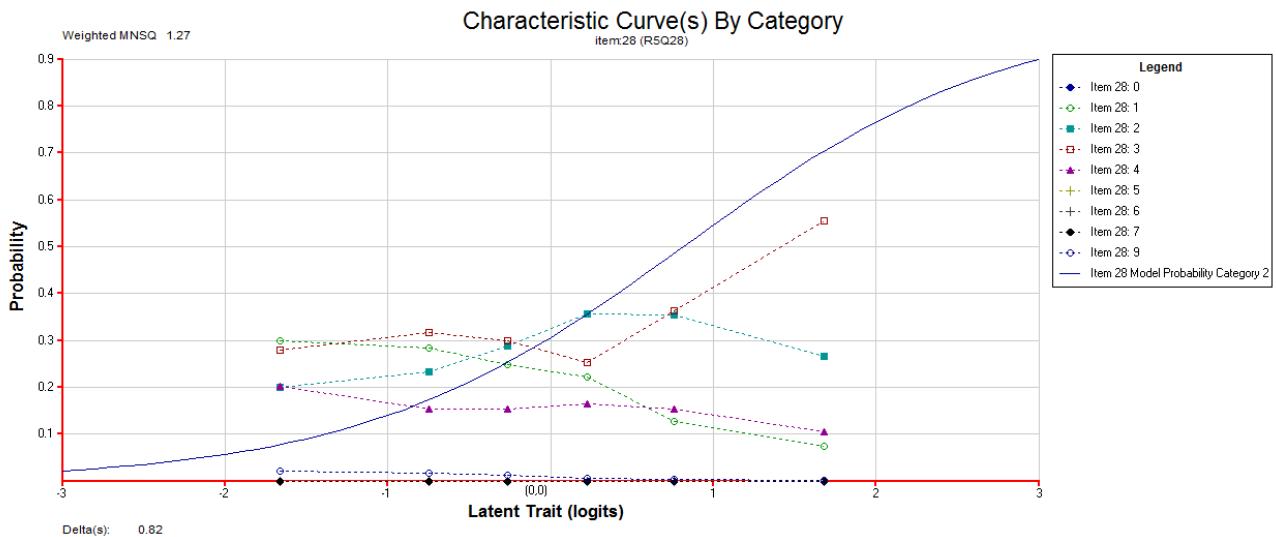

### ***Writing***

The evaluation of goodness of fit to the Rasch model for individual writing items was also based on the weighted mean square statistics. None of the criteria exhibited misfit to the Rasch partial credit model except for punctuation and spelling (i.e., 1.45 and 1.23, respectively). Regarding the ICCs, there were not large differences between the empirical and the expected curves for each of the ten criteria. The ICCs of the ten writing criteria are also included in Appendix D.

**Table 5.4. Summary of Item Statistics in NAPLAN 2017 Tests**

Domain	Year Level	Total Number of Items	Number of Items with Discrimination <0.25	Number of Items with		Number of Items with	
				Infit ≤1.2	Infit > 1.2	Facility > 0.90	Facility < 0.10
Reading	3	37	3	37	0	2	0
	5	37	4	35	2	6	0
	7	48	3	47	1	5	1
	9	49	7	49	0	8	0
Spelling	3	25	0	25	0	0	0
	5	25	0	24	1	1	0
	7	25	0	24	1	2	2
	9	25	0	24	1	1	1
Grammar and Punctuation	3	25	9	25	0	1	1
	5	25	7	25	0	1	0
	7	25	7	25	0	2	1
	9	25	8	25	0	1	1
Numeracy	3	36	4	36	0	2	3
	5	42	1	42	0	5	2
	7	48	3	45	3	2	3
	9	48	1	43	5	0	0

**Figure 5.3. Item characteristic curves for an item with Infit > 1.27**

## 5.6 Differential Item Functioning (DIF) Analyses

According to Camilli and Shepard (1994), item response theory can be used to assess DIF. Specifically,

[i]tem characteristic curves provide a means for comparing the responses of two different groups . . . to the same item. A difference between the ICCs of two groups indicates that . . . examinees [for the two groups] at the same ability level do not have the same probability of success on the item. More technically, DIF is said to occur whenever the conditional probability,  $P(\theta)$ , of a correct response differs for two groups. (Camilli & Shepard, 1994)

In the analysis for NAPLAN, subgroups were arbitrarily categorized as either reference or focal groups. While males, non-LBOTE students, and non-Indigenous students were assigned to the reference group, females, LBOTE students, and Indigenous students were assigned to the focal group for DIF analyses. As mentioned in Chapter 4, independent Rasch analyses were then performed over the same set of items for each subgroup in order to examine any DIF that exists between two subgroups (e.g., males vs. females). The mean item difficulty for each subgroup was centred at zero to adjust for group differences in ability. The difference in the relative item difficulties after adjustment is referred to as the adjusted difference.

For visual depiction of DIF, item locations of the reference group were plotted against those of the focal group as seen from Appendices F, G and H (i.e., gender, LBOTE, and Indigenous status, respectively). Each item is represented by one point on the plot. A diagonal line is plotted as the reference line. If the relative item difficulty for an item is not different in the two groups after taking their relative performance on the test into account, the point representing the item will be on the reference line. The distance of a point from the diagonal reflects the magnitude of DIF. Due to the large sample sizes, confidence bands were very narrow and were not plotted on the charts.

Finally, Tables 5.5, 5.6, and 5.7 summarize the total number of items indicating potential DIF with an absolute adjusted difference of 0.50 or greater for gender and language background (LBOTE), and 0.60 or greater for Indigenous DIF. Figures 5.4, 5.5, and 5.6 are examples of the potential DIF items.

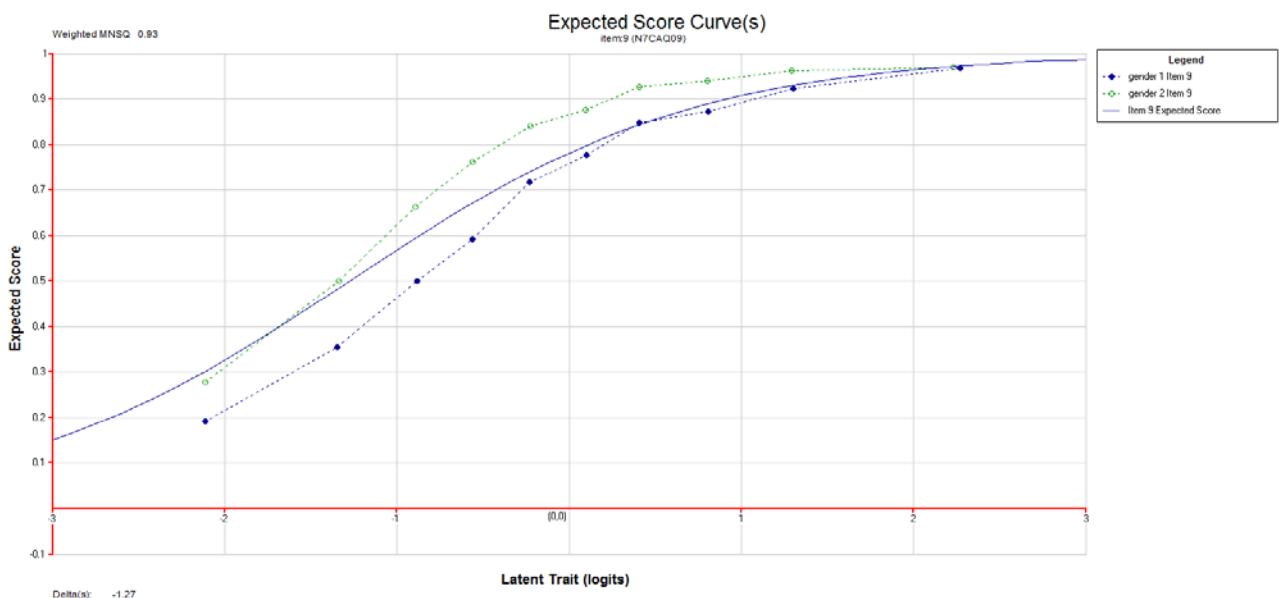

### Gender DIF

Appendix F presents the scatter plots for examining gender DIF in the five domains. The plots for reading, spelling, grammar and punctuation, and numeracy are presented by year levels. The writing gender DIF was performed by combining all four grades together. On the whole, the plots indicate that there are few items that exhibit gender differences in the adjusted item estimates and that any differences are not large and thus were not of great concern.

Table 5.5 identifies the number of items that show potential gender DIF with an absolute adjusted difference of 0.50 or greater for reading, spelling, grammar and punctuation, and numeracy. Figure 5.4 shows as an example, one numeracy item (Item N7CAQ09) with an absolute adjusted difference of 0.50 or greater. This item with a positive adjusted difference indicates that the item was relatively easier (adjusted difference = 0.64) for female students. Appendix F includes DIF plots that show for each of the items the observed curves by gender group compared to the expected ICC.

**Table 5.5. Number of Items Showing Gender DIF by Domain by Year Level**

Year Level	Reading		Spelling		Grammar and Punctuation		Numeracy	
	Total of Test Items	Total of DIF Items	Total of Test Items	Total of DIF Items	Total of Test Items	Total of DIF Items	Total of Test Items	Total of DIF Items
3	37	1	25	0	25	0	36	3
5	37	2	25	1	25	0	42	3
7	48	1	25	0	25	0	48	5
9	49	1	25	2	25	1	48	2

**Figure 5.4. Example of item characteristic curves displaying gender DIF<sup>†</sup>**

<sup>†</sup> 'gender 1' indicates 'Male' and 'gender 2' indicates 'Female'.

### **LBOTE DIF**

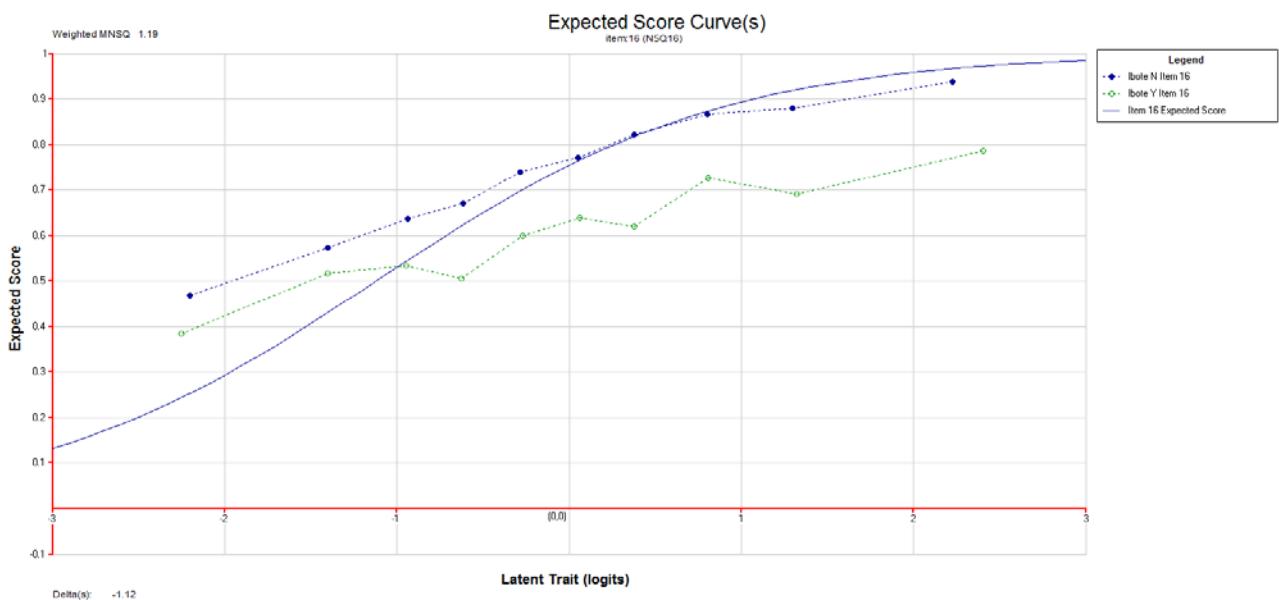

Appendix G shows scatter plots for examining DIF due to language background in the five domains by the four year levels. Writing LBOTE DIF was performed by combining all four grades. These plots indicated that there were not many items that showed notable differences in the relative item difficulties.

Table 5.6 indicates the number of items that show potential DIF with an absolute adjusted difference of 0.50 or greater for reading, spelling, grammar and punctuation, and numeracy. Figure 5.5 depicts one numeracy item (Item N5Q16) with an absolute adjusted difference of 0.50 or greater. This item was relatively easier (adjusted difference = 0.96) for non-LBOTE students.

Appendix G includes DIF plots that show for each of the items, the observed curves by language group compared to the expected ICC.

**Table 5.6. Numer of Items Showing LBOTE DIF by Domain by Year Level**

Year Level	Reading		Spelling		Grammar and Punctuation		Numeracy	
	Total of Test Items	Total of DIF Items	Total of Test Items	Total of DIF Items	Total of Test Items	Total of DIF Items	Total of Test Items	Total of DIF Items
3	37	0	25	2	25	0	36	2
5	37	0	25	2	25	2	42	2
7	48	0	25	1	25	1	48	3
9	49	1	25	2	25	1	48	1

**Figure 5.5. Example of item characteristic curves displaying LBOTE DIF<sup>†</sup>**

<sup>†</sup> ‘Ibole Y’ indicates ‘LBOTE group’ and ‘Ibole N’ indicates ‘Non-LBOTE group’.

### **Indigenous Status DIF**

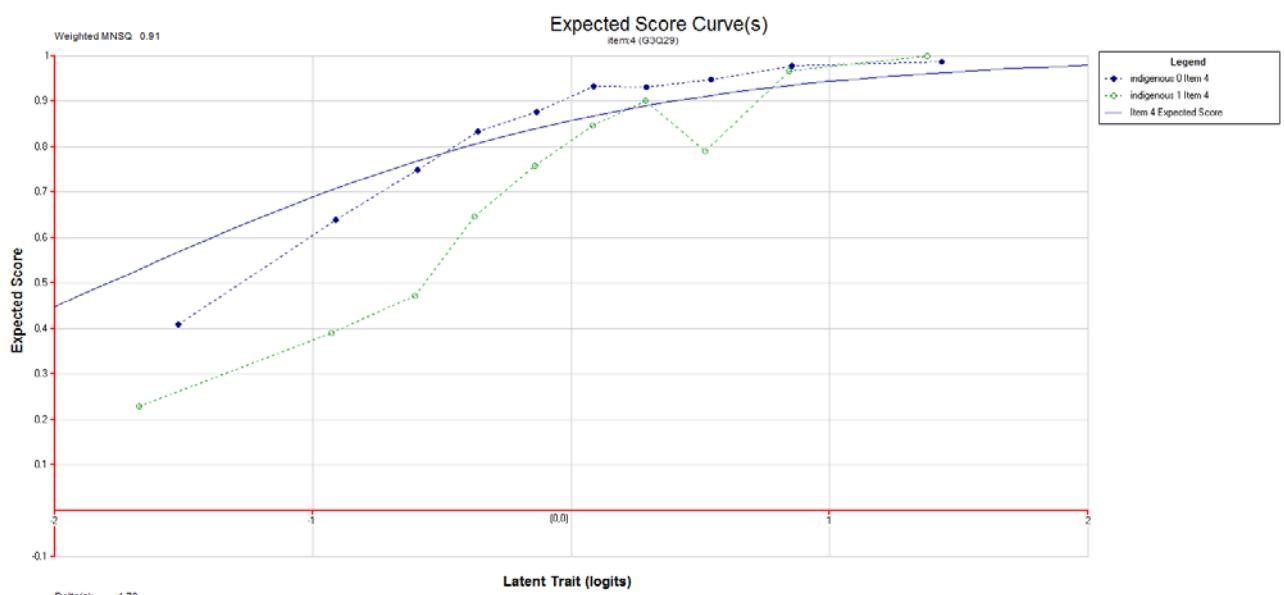

Appendix H includes scatter plots for examining Indigenous DIF in the five domains. Writing Indigenous DIF was performed by combining all four grades. These plots showed that there were not many items that showed notable differences in the relative item difficulties.

Table 5.7 lists the number of items that show potential Indigenous DIF with an absolute adjusted difference of 0.60 or greater for reading, spelling, grammar and punctuation, and numeracy. The larger threshold (i.e., 0.60 instead of 0.50) was used in order to identify only the items that showed larger DIF. Figure 5.5 depicts one grammar and punctuation item (Item G3Q29) with an absolute adjusted difference of 0.60 or greater. This item was relatively easier (adjusted difference = 0.93) for non-Indigenous students.

Appendix H provides the item DIF plots for items listed in Table 5.7. The plots show for each of the items, the observed curves by Indigenous group compared to the expected ICC. In interpreting the plots, it should be noted that there may not be many Indigenous students along parts of the ability range. As a result, one would expect larger variability of empirical probabilities (i.e., the dots connected by dashed lines) about the model-based curve (the solid curves).

**Table 5.7. Numer of Items Showing Indigenous DIF by Domain by Year Level**

Year Level	Reading		Spelling		Grammar and Punctuation		Numeracy	
	Total of Test Items	Total of DIF Items	Total of Test Items	Total of DIF Items	Total of Test Items	Total of DIF Items	Total of Test Items	Total of DIF Items
<b>3</b>	37	8	25	0	25	8	36	6
<b>5</b>	37	7	25	1	25	3	42	6
<b>7</b>	48	2	25	0	25	4	48	5
<b>9</b>	49	6	25	1	25	2	48	7

**Figure 5.6. Example of item characteristic curves displaying Indigenous DIF<sup>†</sup>**

<sup>†</sup> ‘indigenous 1’ indicates ‘Indigenous group’ and ‘indigenous 0’ indicates ‘Non-Indigenous group’.

DIF values of individual items for gender, LBOTE, and Indigenous status are presented in Appendix I.

### ***State/Territory DIF***

The number of items showing statistically significant state/territory related DIF in reading, spelling, grammar and punctuation and numeracy are shown in Table 5.8. In the headings of Table 5.8, ‘E’ indicates that the item is relatively easier for the jurisdiction, and ‘H’ indicates that the item is relatively harder for the jurisdiction. There were 13 potential DIF in reading, 3 in spelling, 17 in grammar and punctuation and 32 in numeracy across all four year levels across the jurisdictions. Table 5.8 can be read in conjunction with Appendix I, from which the items showing state/territory related DIF can be identified. For example, from Table 5.8, there were three items in Year 3 reading showing DIF in NT when compared to the national level, with all three items (R3Q01, R3Q02, and R3Q04) being harder for NT, as seen from Appendix I.

**Table 5.8. Number of Items Showing State/Territory DIF by Domain by Year Level**

Domain	Year Level	ACT		NSW		NT		QLD		SA		TAS		VIC		WA	
		E	H	E	H	E	H	E	H	E	H	E	H	E	H	E	H
Reading	3	0	0	0	0	0	3	0	0	0	0	0	0	0	0	0	0
	5	0	0	0	0	1	4	0	0	0	0	0	0	0	0	0	0
	7	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	9	0	0	0	1	0	1	0	1	0	0	0	0	0	1	0	1
Spelling	3	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	5	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	7	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
	9	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	1
GP	3	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
	5	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0
	7	0	1	0	0	0	0	0	0	0	0	1	0	1	1	0	0
	9	0	1	1	1	0	0	1	2	0	0	0	1	0	1	0	2
Numeracy	3	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
	5	0	0	0	0	1	2	1	0	0	0	0	0	0	0	0	0
	7	0	0	3	2	0	0	2	1	0	1	0	1	0	0	2	0
	9	0	0	5	2	0	0	1	0	0	0	0	2	3	0	1	1

Note. ‘E’ indicates that the item is relatively easier for the jurisdiction, and ‘H’ indicates that the item is relatively harder for the jurisdiction.

To examine the state/territory DIF for the writing test, the expected score curves of ten rating criteria were plotted for the eight states/territories in Appendix J. None of the criteria showed notable differences across states/territories.

## CHAPTER 6      EQUATING PROCESS

NAPLAN results are reported using five national achievement scales, one for each of the assessed domains of literacy – reading, writing, spelling and grammar and punctuation, and one for numeracy. The vertical and horizontal equating design is represented schematically in terms of data matrix in Figure 6.1. Each year in NAPLAN, the scales are vertically equated so that each NAPLAN achievement scale spans Years 3, 5, 7 and 9; i.e., there is a single scale for each assessment domain. All assessments other than writing are vertically equated by including common items in tests administered to adjacent year levels; i.e., Year 3/5, Year 5/7 and Year 7/9. The responses to the common items are represented as the shaded columns in Figure 6.1 that overlap between adjacent year levels. For the purpose of monitoring student achievement over time, the 2017 NAPLAN scale for each domain needs to be horizontally equated to the historic NAPLAN reporting scale.

Because NAPLAN test materials are considered in the public domain after the tests are administered, it is not possible to use common items to horizontally equate the tests over time. Instead, common-person equating is used. The secure equating test forms used for horizontal equating in 2009 through 2016 were used for common-person equating again in 2017, noting that some of the secure forms have been modified or updated. Students from Years 3, 5, 7 and 9 in the equating sample were administered the secure equating forms at their year level in addition to the 2017 main NAPLAN test forms. The equating data were used to equate the 2017 tests onto the existing NAPLAN reporting scales.

The horizontal equating provides one basis for placing the 2017 NAPLAN Year 3, Year 5, Year 7 and Year 9 tests on the vertical NAPLAN scale for each domain because item locations for the secure forms are on the NAPLAN scale. The common items in the tests administered to adjacent year levels also provide a basis for vertically equating the scales. As in previous years, the results of common person equating were checked against the results of 2017 common-item vertical equating and both sets of results were taken into consideration in finalising the scaling of the reading, spelling, grammar and punctuation and numeracy tests.

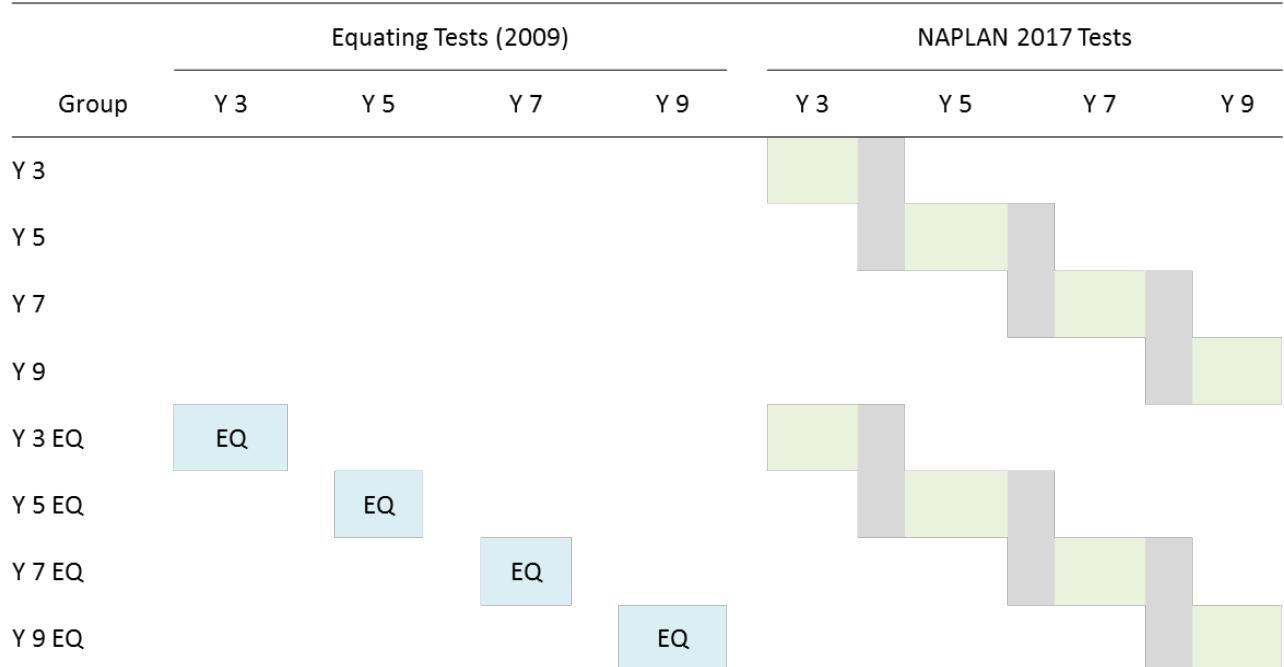

The writing prompt of NAPLAN can be either persuasive or narrative. From 2008 to 2010 the prompt was narrative; from 2011 to 2015 a persuasive prompt was used. In 2011, a persuasive writing scale, separate from the narrative scale, was introduced. NAPLAN 2016 employed a narrative test. New analytical methods were used in 2016 to put the results of the narrative test onto the existing persuasive writing scale, creating a NAPLAN writing scale comparable for both genres for writing performance from 2011. In 2017 a persuasive writing task was administered in NAPLAN and the resulting scale was equated to the NAPLAN writing scale. In 2017, as in 2015 and 2016, one task was administered to Year 3 and 5 students and a different task was administered to Year 7 and 9 students. The process of equating for writing is described in section 6.6.

### 6.1 Horizontal Equating for Reading, Spelling, Grammar and Punctuation and Numeracy

The horizontal equating design for all tests other than writing involved a two-step procedure that combines common-person and common-item test equating methods. The common-person equating was achieved through the equating sample. The equating was carried out using secure equating forms that were administered with the NAPLAN 2017 tests for reading, spelling, grammar and punctuation and numeracy. Each student in the equating sample completed an equating form in addition to the NAPLAN 2017 tests that the full cohort to

which they belong completed. Figure 6.1 shows the horizontal equating design for each of reading, spelling, grammar and punctuation and numeracy at each year level.

The equating form for each domain at each year level had already been scaled onto the historic NAPLAN scale in 2009. The first step was to place the NAPLAN 2017 test and the equating form on the same scale, for each domain at each year level, using the common-person equating data. The second step was to equate each of the 2017 NAPLAN tests onto the historic NAPLAN domain scale using the relevant equating form through the process of common-item equating.

**Figure 6.1. Equating design for each assessment domain**

The vertical scales were originally established in 2008. In each new calendar year, link items are included in the tests for adjacent year levels and new vertical equating is conducted. This provides the basis for obtaining new estimates of vertical shift constants to equate the 2017 Years 3, 5, 7 and 9 tests vertically onto the same scale. The tests are also equated horizontal to the historic scale using the secure forms. Consequently, the horizontal equating through equating forms also places the four year-level tests onto the NAPLAN vertical scale. The horizontal equating provides indirect vertical linking that ideally will agree with the direct vertical linking. In most cases, there was a reasonable level of agreement between the horizontal and vertical links.

## 6.2 Calibrations of the Equating Forms and Item Reviews

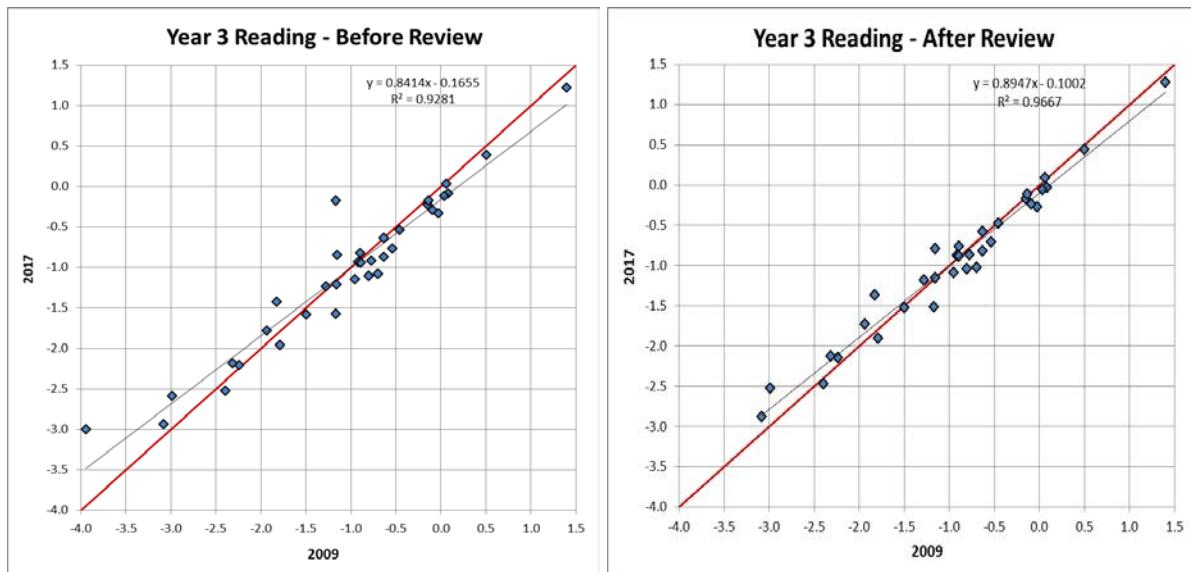

Test calibrations were carried out separately for each of the 16 equating test forms (four domains at four year levels). The equating form and the corresponding 2017 test were jointly calibrated for each domain and each year level using the combined common-person equating data and anchoring on the delta-centred item parameters of the 2017 test on the 2017 preliminary scale.

The analyses of the equating data described above provided a set of item parameters on the preliminary NAPLAN 2017 scale for each of the equating forms. The set of 2017 equating

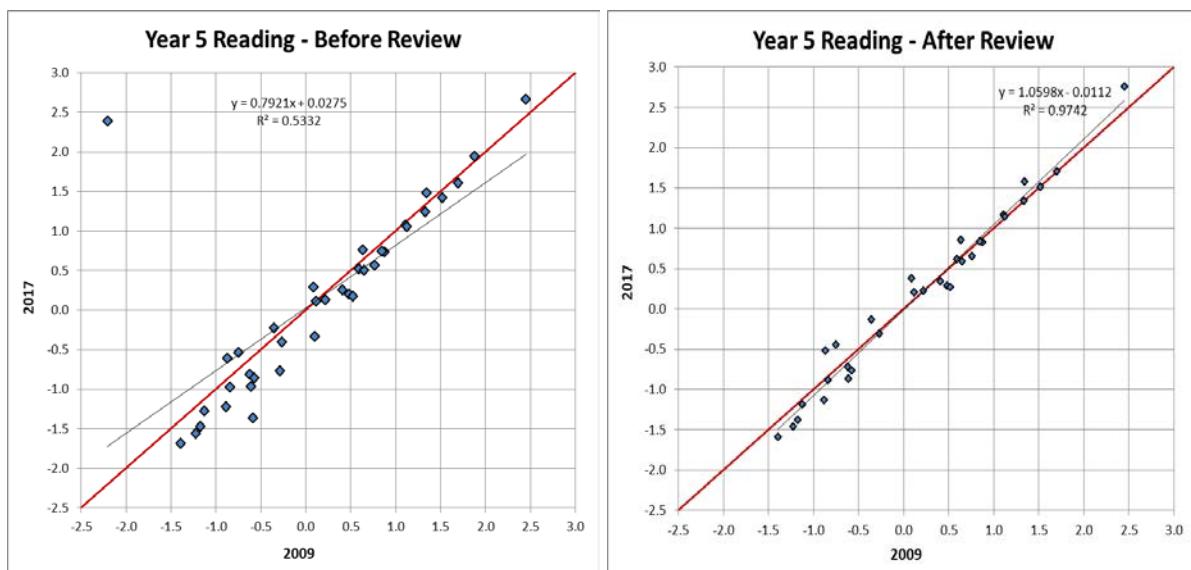

form item estimates was then compared with the item estimates of the 2009 equating forms which were on the historic NAPLAN scale. Items were considered for deletion as links if they functioned poorly (based on Mean Square indices and ICCs) and/or if their relative locations differed by an absolute value of greater than 0.3 compared with their locations on the original 2009 scale for the relevant secure form.

Figures 6.2 to 6.17 show the comparisons of the 2009 item parameters and 2017 item parameters for items on each of the 16 equating tests. Each figure shows a pair of parameter plots of the linked items, before and after review, in each domain and for each year level. Ideally, the bivariate points would follow the identity line, which is shown in each figure for reference as a solid line.

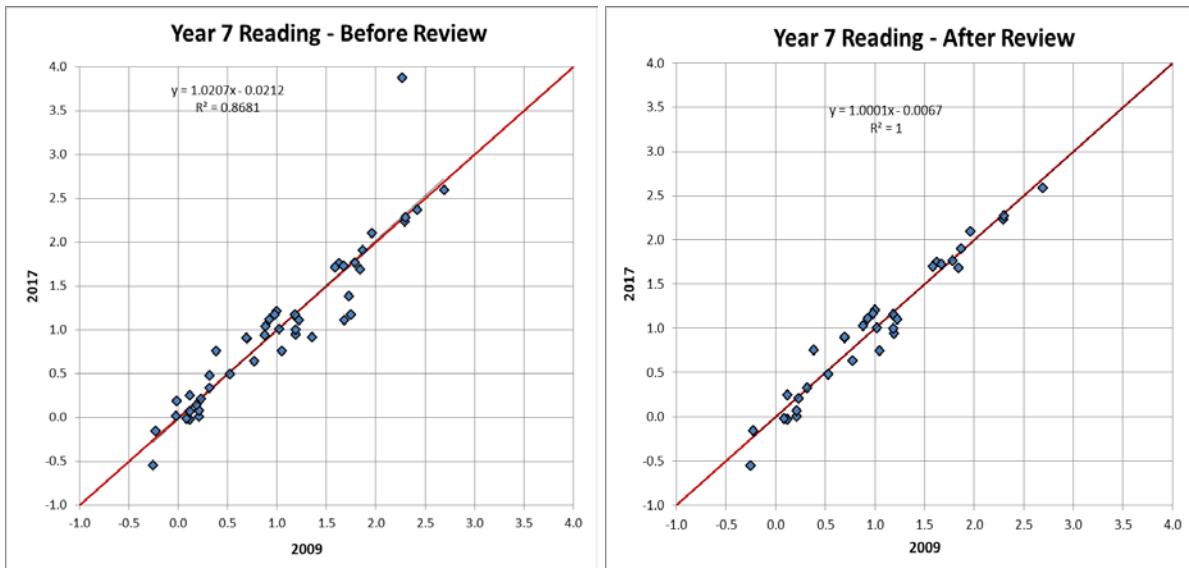

Equating items that were modified over time had been omitted from the horizontal linking.

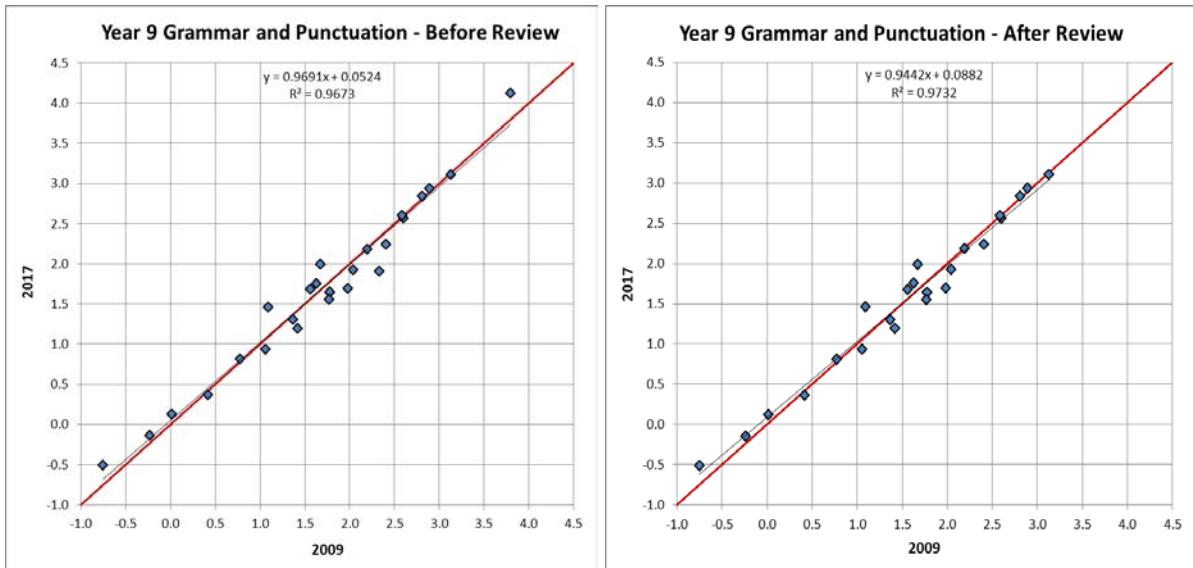

**Figure 6.10.** Links review for Grammar and Punctuation equating form Year 3 (2017 vs. 2009)

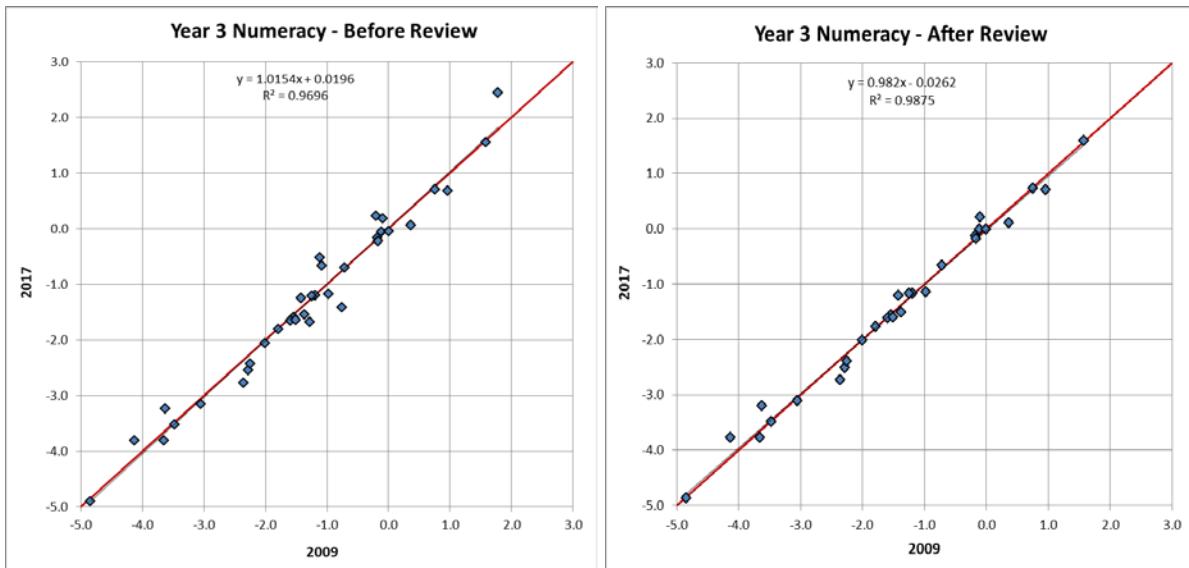

**Figure 6.11.** Links Review for Grammar and Punctuation equating form Year 5 (2017 vs. 2009)

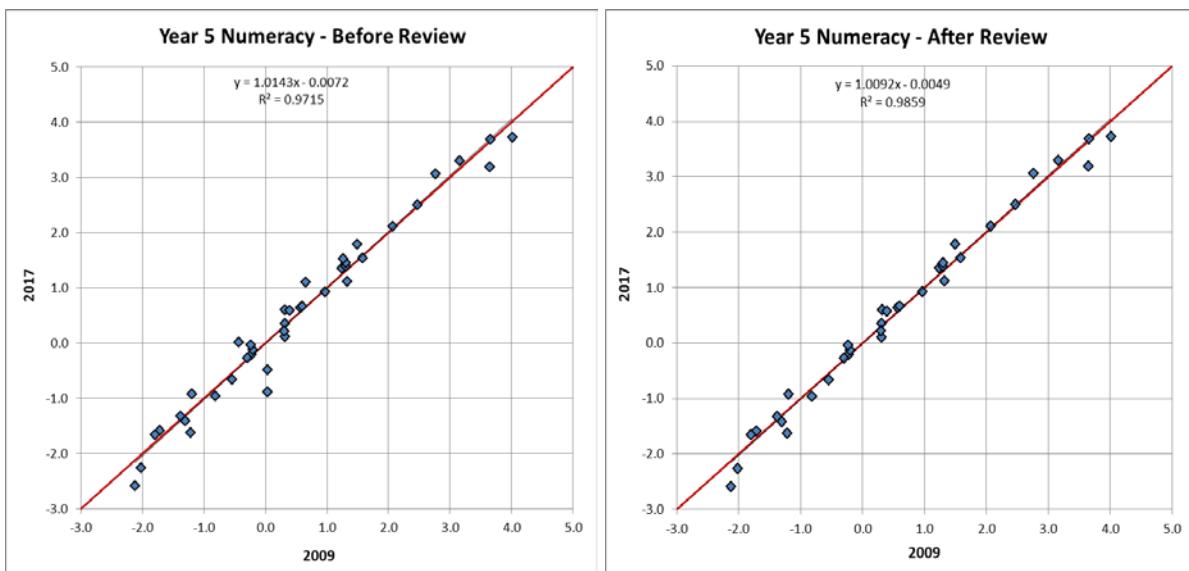

**Figure 6.12.** Links Review for Grammar and Punctuation equating form Year 7 (2017 vs. 2009)

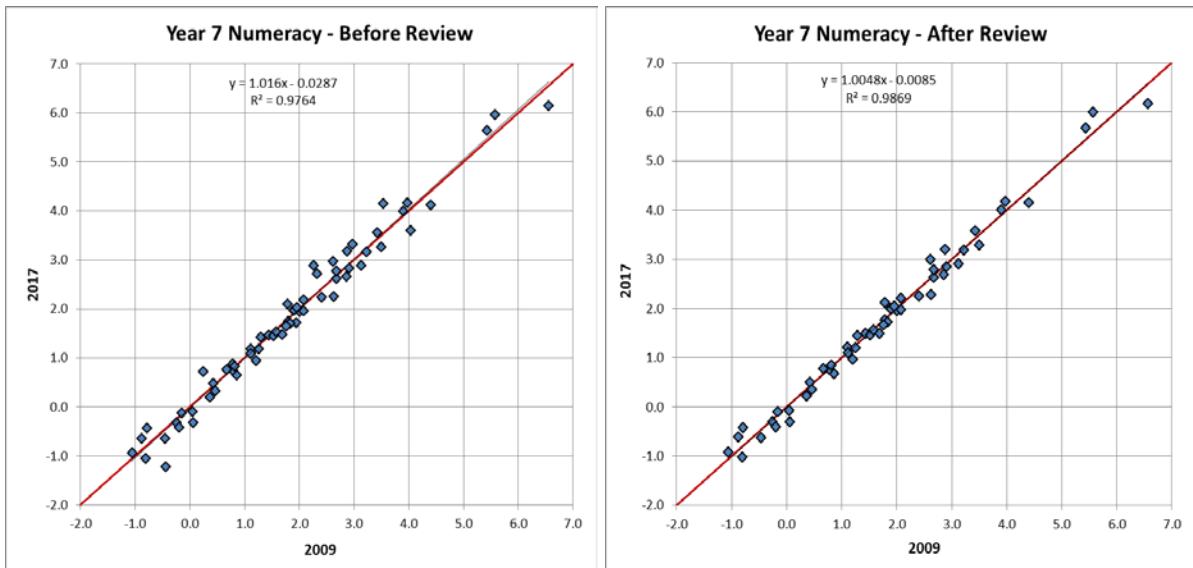

**Figure 6.13.** Links review for Grammar and Punctuation equating form Year 9 (2017 vs. 2009)

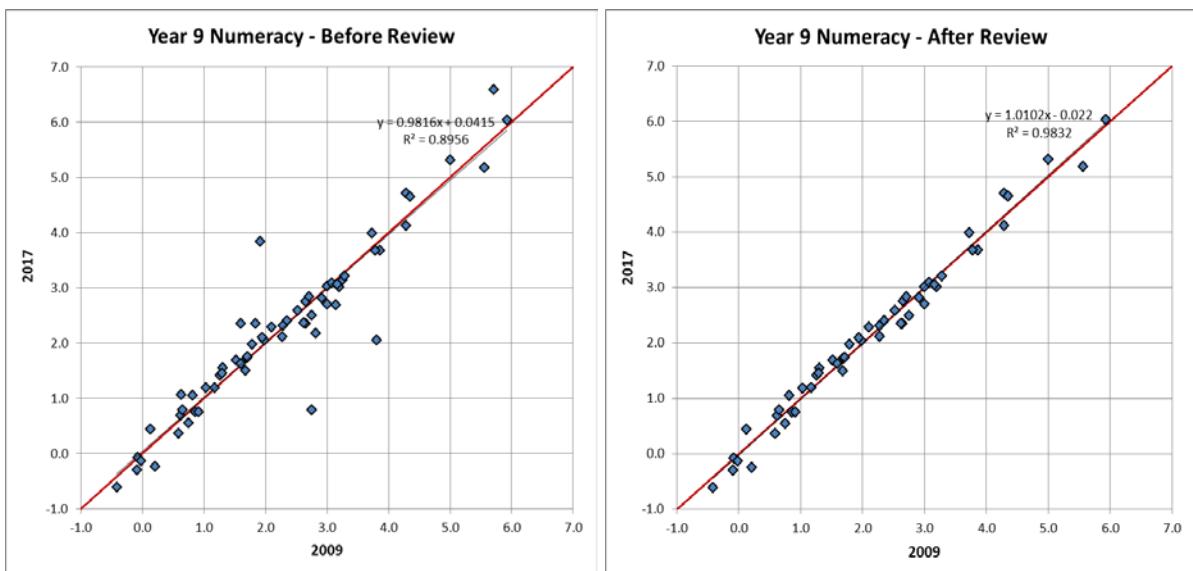

**Figure 6.14.** Links review for Numeracy equating form Year 3 (2017 vs. 2009)

**Figure 6.15.** Links review for Numeracy equating form Year 5 (2017 vs. 2009)

**Figure 6.16. Links review for Numeracy equating form Year 7 (2017 vs. 2009)**

**Figure 6.17. Links review for Numeracy equating form Year 9 (2017 vs. 2009)**

After the review and evaluation of the equating items, a final set of link items was identified for each domain and each year level. The final sets of link items were used to calculate the shift to be applied to equate the 2017 equating forms onto the historical NAPLAN reporting scale, thus aligning the 2017 tests with the historic NAPLAN reporting scale.

Table 6.1 shows the horizontal shift-constants for each domain at each year level. The shifts are those required to equate the final set of link items for each domain and year level, based on the 2017 calibration, with the 2009 item locations of the same set of link items.

**Table 6.1. Horizontal Shifts for Equating the 2017 Item Locations with 2009 Item Locations**

Year Level	Reading	Spelling	Grammar and Punctuation	Numeracy
Year 3	-0.085	-0.909	0.183	-0.879
Year 5	0.255	0.733	1.038	0.045
Year 7	1.052	2.215	1.535	1.513
Year 9	1.471	3.616	1.986	2.506

The horizontal equating of each of the 2017 NAPLAN domain scales in reading, spelling, grammar and punctuation and numeracy to the corresponding historical NAPLAN scales had provisionally put each of the tests on the vertical NAPLAN scales. The locations of the year-level tests on the scale based on the horizontal equating results were compared with their relative locations based on the vertical equating results. Both sets of results were taken into consideration in determining the final shifts. The vertical equating of the 2017 tests is described in the next section.

### 6.3 Common-Item Vertical Equating of NAPLAN 2017 Tests

As in previous years of testing, the 2017 NAPLAN reading, spelling, grammar and punctuation and numeracy tests were vertically equated across Years 3, 5, 7 and 9 using link items embedded in tests in adjacent year levels. The quality of these link items was systematically reviewed for each domain. Only items that were considered to be good link items were used in the vertical equating.

Starting with the separate calibration of each test and using delta-centred item parameters, a vertical scale was constructed by determining the shift-constants (translation) between adjacent tests to equate the common items such that the tests are on a common scale.

A common item was considered for omission (i.e. not to be used as for vertical linking purposes) based on the fit of the item and evidence for Differential Item Functioning (DIF). An overarching principle, agreed in previous years, was to maximise the number of links retained where possible. In practical terms, the adoption of this principle means erring on the side of using a link where there is doubt regarding the justification and basis for its omission.

A four-stage process was used, as detailed to follow.

#### *Vertical Equating Stages*

The vertical equating process was undertaken in four stages as follows:

Stage 1. Initial cross-year scatterplots with all items are examined to ascertain the overall correlation and to note any patterns and outliers.

Stage 2. Each item is checked for misfit at each year level based on: inspection of the ICC and graphical fit; the magnitude of the Outfit index; and the discrimination/slope estimate. Items that have no pronounced misfit in either year level form the reference set provided there are sufficient items.

Stage 3. Items that have high or low discrimination are identified and omitted from the review set if their inclusion affects the shift constant in the predicted direction. The effect is judged based upon changes in the shift constant for all items other than those omitted relative

to the shift obtained for the reference set alone.

Stage 4. Items are omitted that show cross year-level DIF that affects the vertical shift.

Decisions to omit items due to misfit are not based on any one indicator in isolation; rather, decisions are based on all available evidence concerning the functioning of each item. Items that fail some criteria are normally excluded from the reference set but may have been retained if the total number of functioning links was relatively small.

At the last stage, items were considered for deletion based on DIF if the absolute adjusted difference was greater than 0.3 and if the absolute standardised difference was greater than the criterion set.

After each stage, the cross-year level scatterplot was evaluated with a focus on the agreement of bivariate data with the identity line. The ratio of the standard deviations of the item locations was checked for each adjacent year level (e.g., Year 3 SD/Year 5 SD). Ideally the ratio should fall between 0.9 and 1.1. If there were insufficient items to evaluate the correspondence of the data with the identity line, it was necessary to relax the criteria applied in earlier stages of the method.

Three sets of link items (Year 3 and Year 5, Year 5 and Year 7, Year 7 and Year 9) were reviewed for each of the four domains. In each domain, the items administered to each year level were calibrated separately. For each pair of adjacent tests with common items, mean item parameters of the common items were calculated for the tests administered to each of the two-year levels. The vertical shift is the difference between the two means. The first vertical shift was applied to equate common Year 3 and Year 5 items by adjusting the Year 3 locations. The second vertical shift was applied to equate common Year 7 items to the common Year 5 items. The third vertical shift was applied to equate common Year 9 items to the common Year 7 items. The vertical shifts were computed based on the delta-centred item locations, i.e., based on usual constraint that the mean item location is 0. Thus, the preliminary vertical scale is centred about the Year 5 item locations.

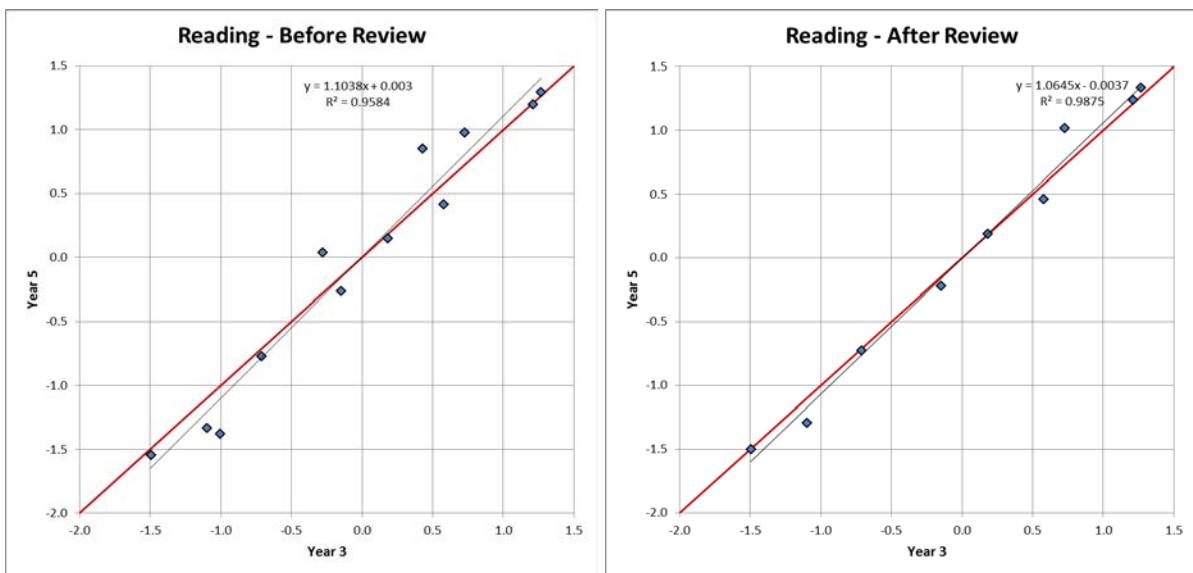

In each case, the vertical shift is a constant that needs to be applied so that the mean adjusted difference is zero. This is so that the means of item locations for common items in adjacent year levels are equal. This allows the comparison of relative difficulties of the common items in the two tests. The standardised differences for each common item were also calculated.

For each pair of adjacent tests, one set of item parameters was then plotted against the other set of item parameters. Two plots are presented below for each review: one plot for the set of common items to be reviewed and one plot for the retained link items after review. On the plots, each dot represents a common item. The 24 plots are shown in Figure 6.18 to Figure 6.29.

### ***Vertical Equating of 2017 Reading Tests***

#### ***Reading – Year 3/Year 5***

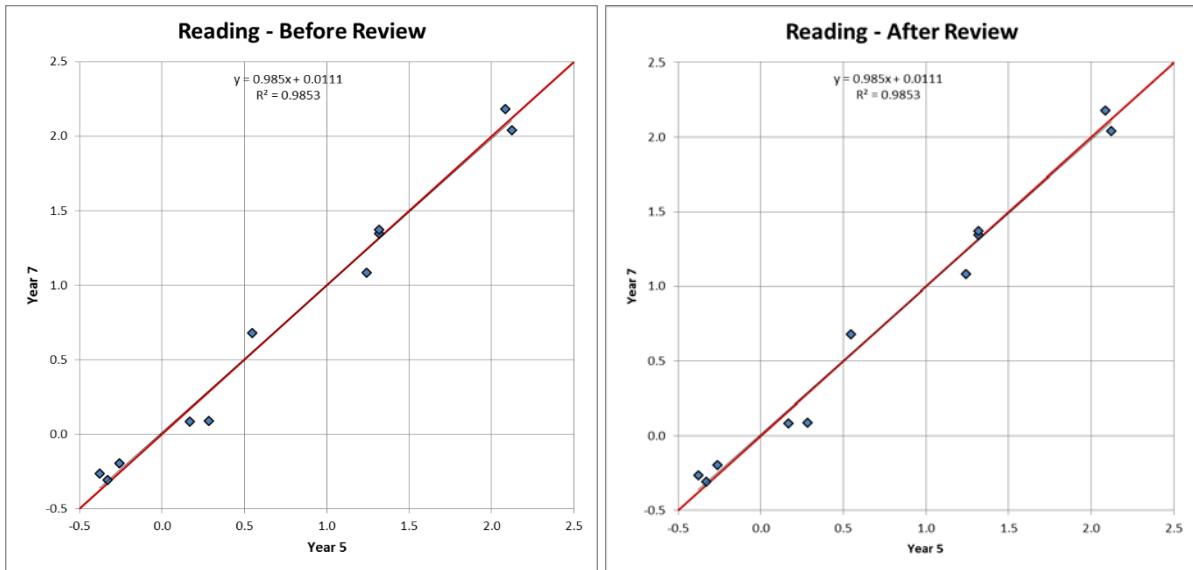

Figure 6.18 shows the Year3/Year 5 reading links before and after review. One item that was misfitting with low discrimination and showing evidence of guessing was omitted before the evaluation and not shown on the plot. Three items were deleted as links during the review. These items showed cross-year level DIF beyond the criterion level.

**Figure 6.18. Links review for Reading Year 3 and Year 5**

#### *Reading – Year 5/Year 7*

Figure 6.19 shows the Year 5/Year 7 reading links before and after review. Two items that had low discrimination for Year 5 were omitted before the evaluation and not shown on the plot. No item was deleted as links during the review.

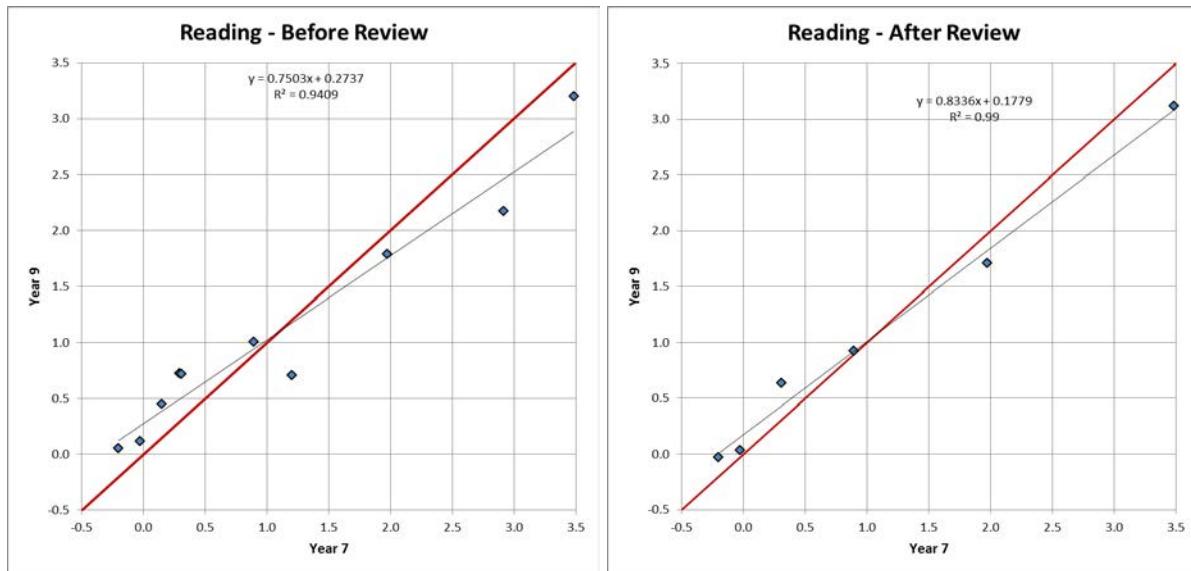

**Figure 6.19. Links review for Reading Year 5 and Year 7**

#### *Reading – Year 7/Year 9*

Figure 6.20 shows the Year 7/ Year 9 reading links before and after review. One item that showed low discrimination at both Years 7 and 9 was omitted before the evaluation and not shown on the plot. Four items were deleted as links during the review. Three items showed

cross-year level DIF beyond the criterion level and one item showed misfit. With the deletion of these link items, the slope of the best fit line was improved from 0.75 to 0.83.

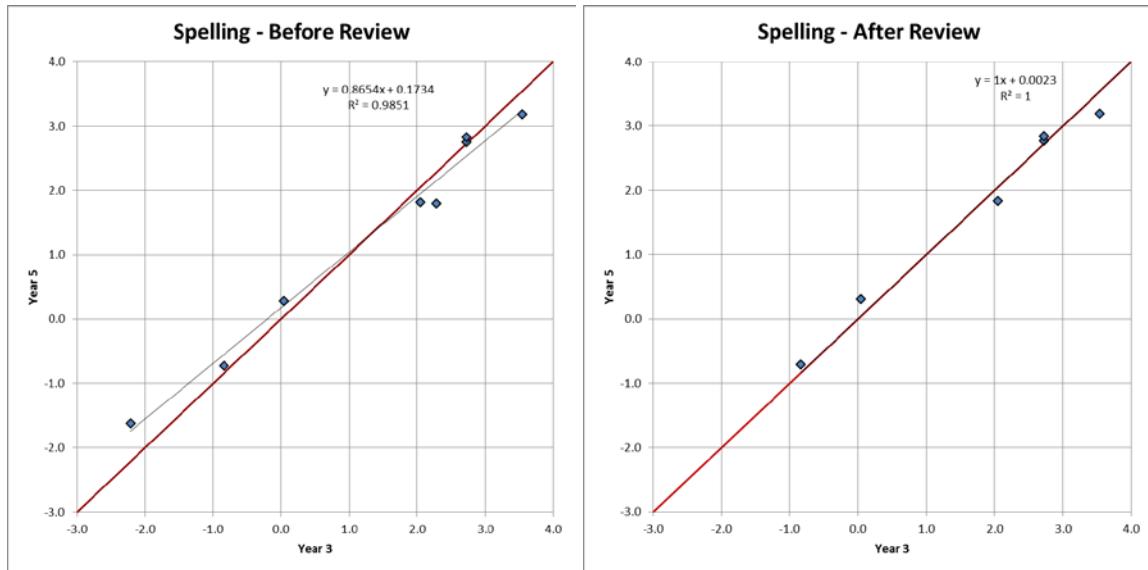

**Figure 6.20. Links review for Reading Year 7 and Year 9**

### *Vertical Equating of 2017 Spelling Tests*

#### *Spelling – Year 3/Year 5*

The Year 3/Year 5 vertical equating is summarised in Figure 6.21. Two items showing DIF beyond the criterion level were omitted as links.

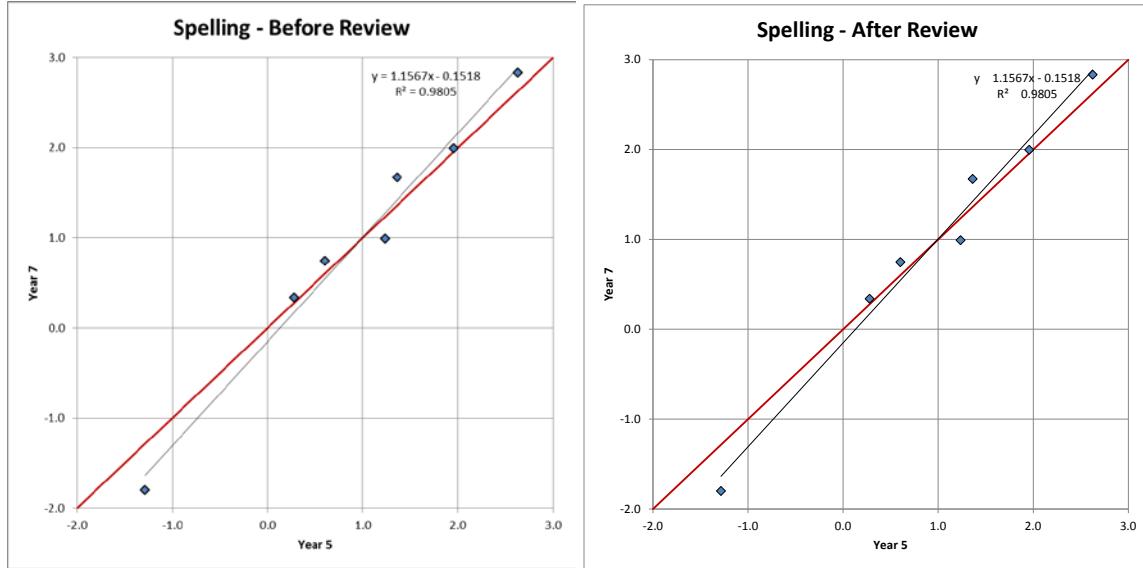

**Figure 6.21. Links review for Spelling Year 3 and Year 5**

#### *Spelling – Year 5/Year 7*

The Year 5/ Year 7 links are shown in Figure 6.22. One item that is misfitting with low

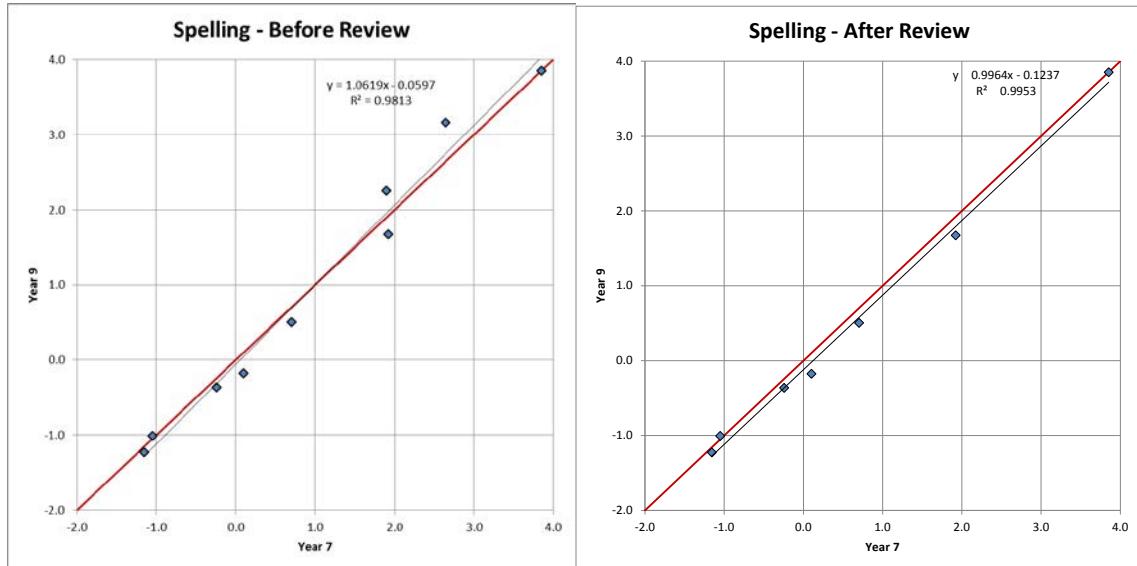

discrimination was omitted before the evaluation and not shown on the plot. No other item was deleted.

**Figure 6.22. Links review for Spelling Year 5 and Year 7**

#### *Spelling – Year 7/Year 9*

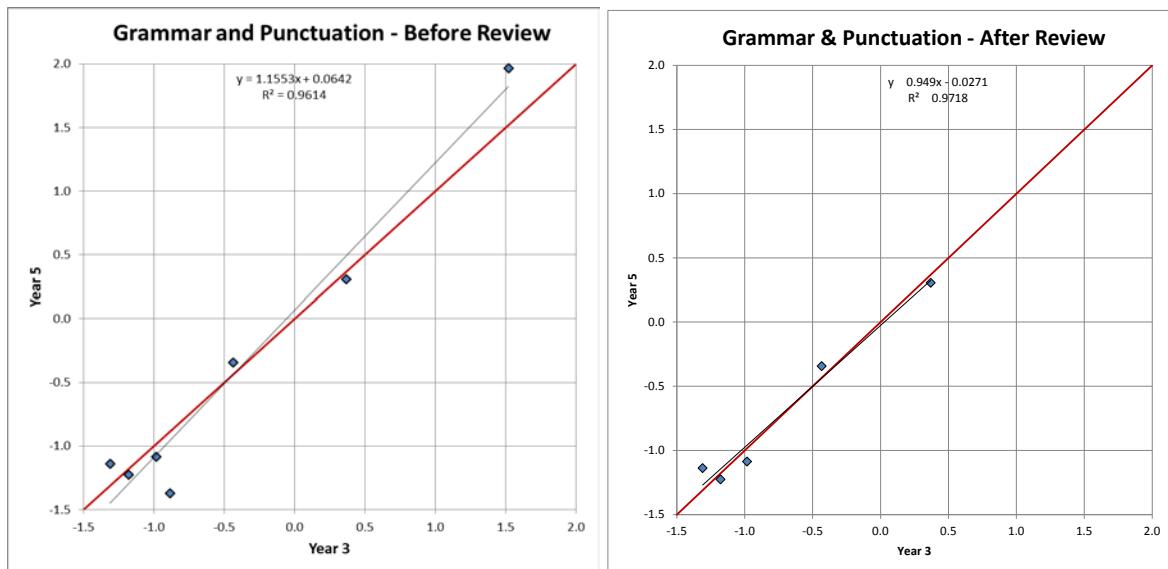

The Year 7/ Year 9 links are summarised in Figure 6.23. Two items were deleted as links due to cross-level DIF.

**Figure 6.23. Links review for Spelling Year 7 and Year 9**

**Vertical Equating of 2017 Grammar and Punctuation Tests****Grammar and Punctuation – Year 3/Year 5**

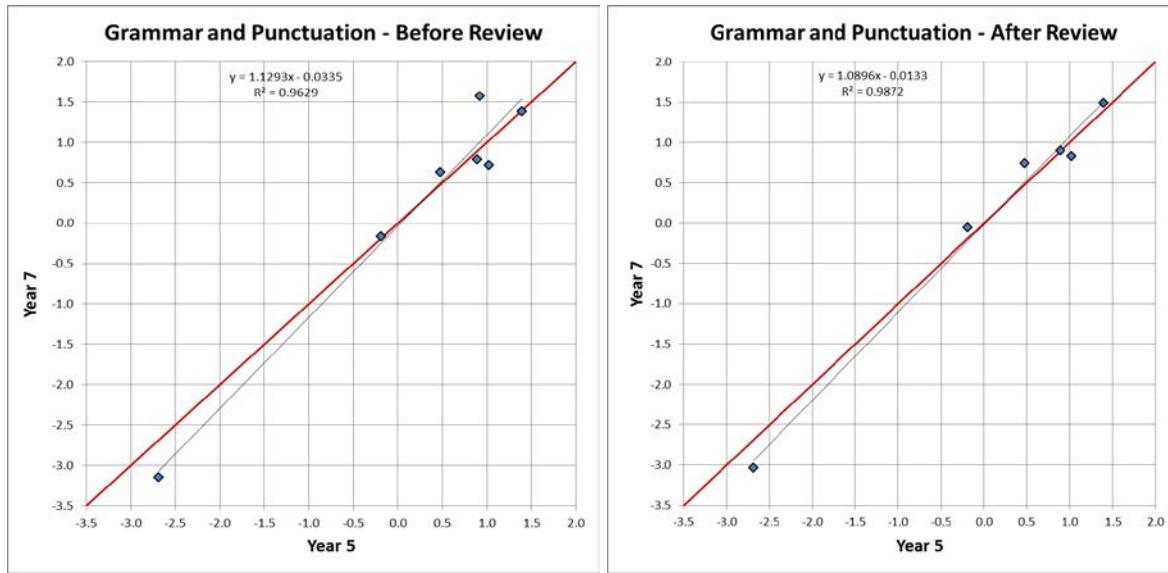

Figure 6.24 shows the Year 3/Year 5 grammar and punctuation scatterplots before and after review. Two items were deleted due to cross-year level DIF.

**Figure 6.24. Links review for grammar and punctuation Year 3 and Year 5**

*Grammar and Punctuation – Year 5/Year 7*

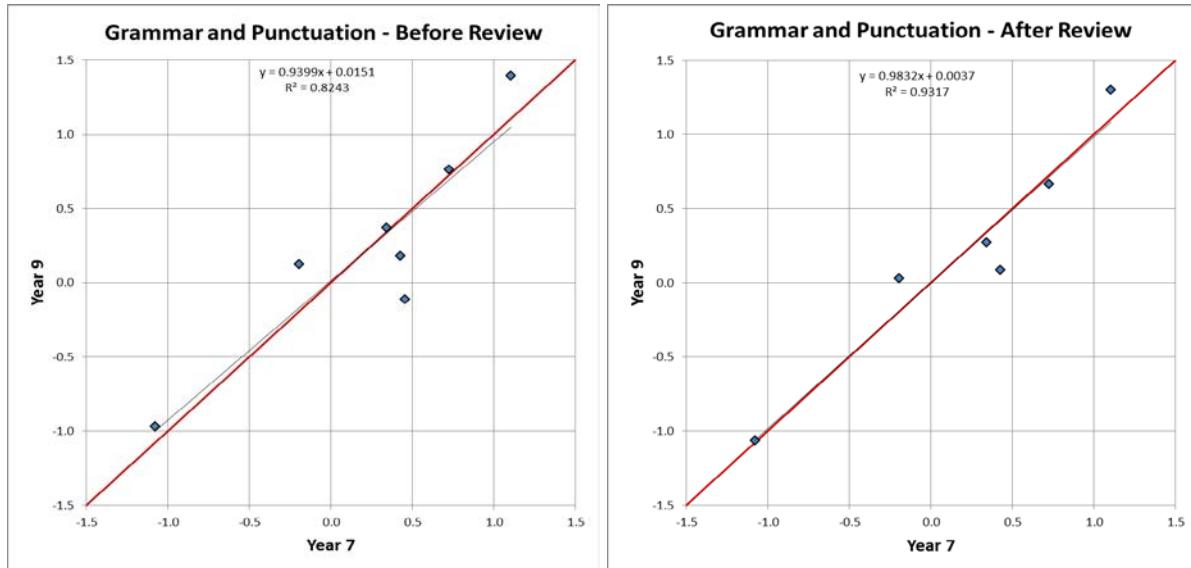

Figure 6.25 shows the Year 5/Year 7 grammar and punctuation scatter plots of link items before and after review. One item showing cross-level DIF was omitted as links.

**Figure 6.25. Links review for grammar and punctuation Year 5 and Year 7**

*Grammar and Punctuation – Year 7/Year 9*

Figure 6.26 shows the scatterplots for Year 7/ Year 9 vertical links before and after review. One item that showed low discrimination at both Years 7 and 9 was omitted before the evaluation and not shown on the plot. One item showing cross-level DIF was omitted as link.

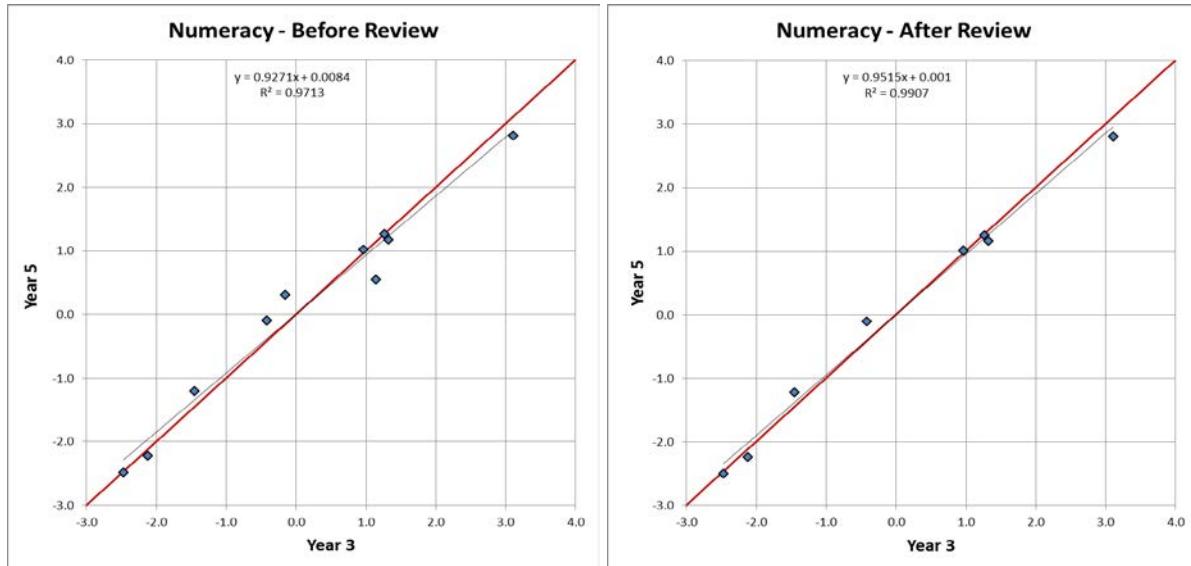

**Figure 6.26. Links review for Grammar and Punctuation Year 7 and Year 9**

### **Vertical Equating of 2017 Numeracy Tests**

#### *Numeracy – Year 3/Year 5*

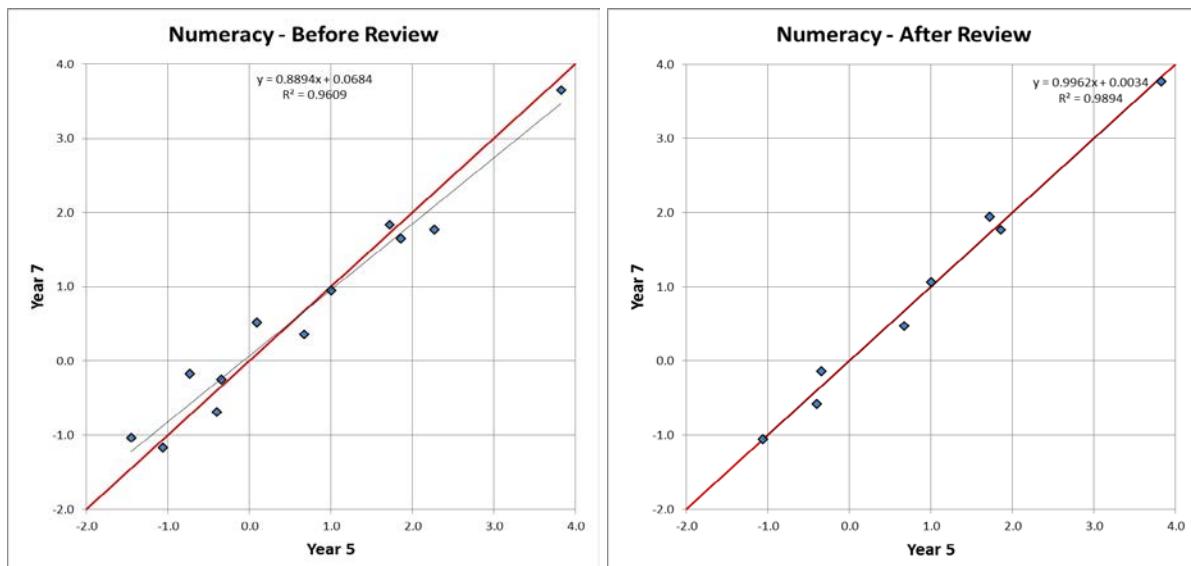

Figure 6.27 shows the scatterplots for Year 3/ Year 5 vertical links for numeracy before and after review. Two items showing cross-level DIF were omitted as links.

**Figure 6.27. Links review for Numeracy Year 3 and Year 5**

#### *Numeracy – Year 5/Year 7*

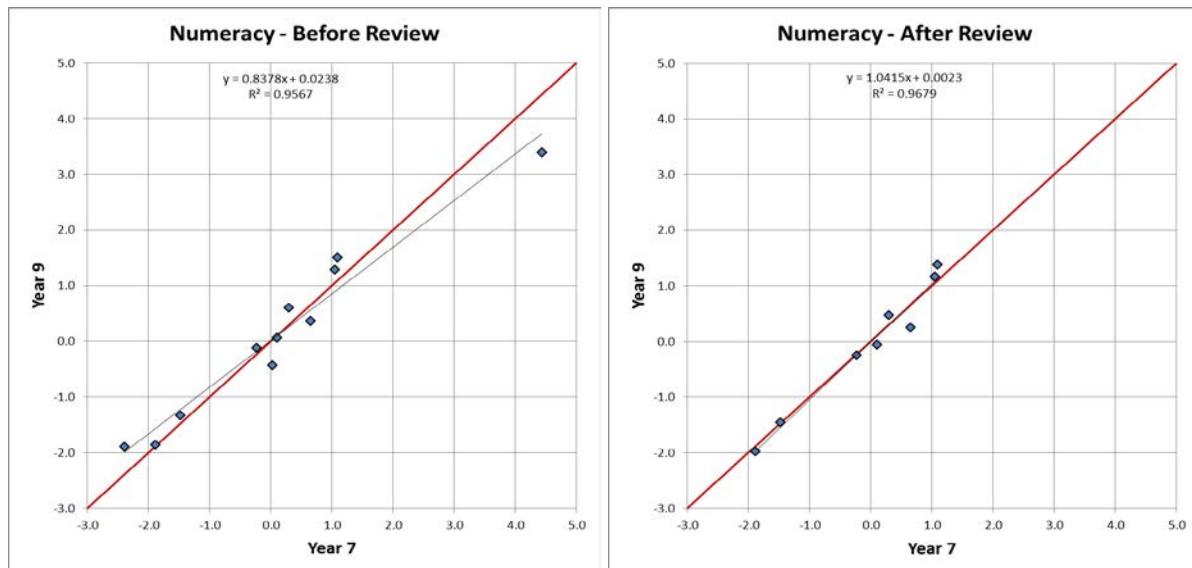

Figure 6.28 shows the scatterplot before and after review for numeracy Years 5 and 7. One item that showed low discrimination at both Years 5 and 7 was omitted before the evaluation and not shown on the plot. Four more items were omitted as links due to cross-level DIF.

**Figure 6.28. Links review for Numeracy Year 5 and Year 7**

*Numeracy – Year 7/Year 9*

Figure 6.29 shows the scatter plots of vertical link items of the Year 7 and Year 9 numeracy tests. Two items that showed low discrimination at Years 7 were omitted before the evaluation and not shown on the plot. Three items were omitted as links based on cross-level DIF. The slope of the best fit line was improved from 0.84 to 1.04.

**Figure 6.29. Links review for Numeracy Year 7 and Year 9**

The numbers of the vertical links used and retained for each adjacent pair of year levels are shown in Table 6.2. Appendix L presents the 2017 item locations (Rasch difficulty parameters), standard errors, mean square statistics, item facilities, and item discriminations by domain for each adjacent pair of year levels.

**Table 6.2. Vertical Link Review Summary**

Domain	Year 3 / 5		Year 5 / 7		Year 7 / 9	
	No. Links Retained	Total No. of Links	No. Links Retained	Total No. of Links	No. Links Retained	Total No. of Links
Reading	9	13	11	13	6	11
Spelling	6	8	7	8	7	9
Grammar and Punctuation	5	7	6	7	6	8
Numeracy	8	10	8	13	8	13

*Summary of Vertical Equating of NAPLAN 2017 Tests*

The mean shifts between two adjacent year levels for each of the four domains are shown in Table 6.3. Year 5 has been used as the reference to which other years are vertically equated as in previous administrations of the program.

**Table 6.3. Vertical Shift Constants**

Shift	Reading	Spelling	Grammar and Punctuation	Numeracy
Year 3 to 5	-0.331	-1.896	-0.666	-0.817
Year 5 to 5	0.000	0.000	0.000	0.000
Year 7 to 5	0.940	1.733	0.829	1.596
Year 9 to 7	0.598	1.114	0.220	0.800
Year 9 to 5	1.538	2.847	1.049	2.396

The final locations of the 2017 tests on each of the NAPLAN domain scales were determined by taking both of the horizontal equating results and the vertical equating results into consideration. The procedure and results are described in Section 6.4.

#### 6.4 Comparing and Combining Results of Horizontal and Vertical Equating

The NAPLAN vertical scale spanning Years 3, 5, 7 and 9 was established in 2008 through vertical equating of the year level tests. The horizontal equating provides one basis for placing the NAPLAN 2017 tests on the vertical scale for each domain. The horizontal equating forms were first used in 2009.

It is useful to check the relative locations of the NAPLAN 2017 tests on the NAPLAN scale by comparing the results based on the horizontal equating against those based on the vertical equating. Figure 6.1 depicts the horizontal and vertical equating design schematically. In principle, each year-level test can be equated directly on to the NAPLAN scale through the horizontal equating without the vertical equating. The vertical equating serves as a quality assurance check.

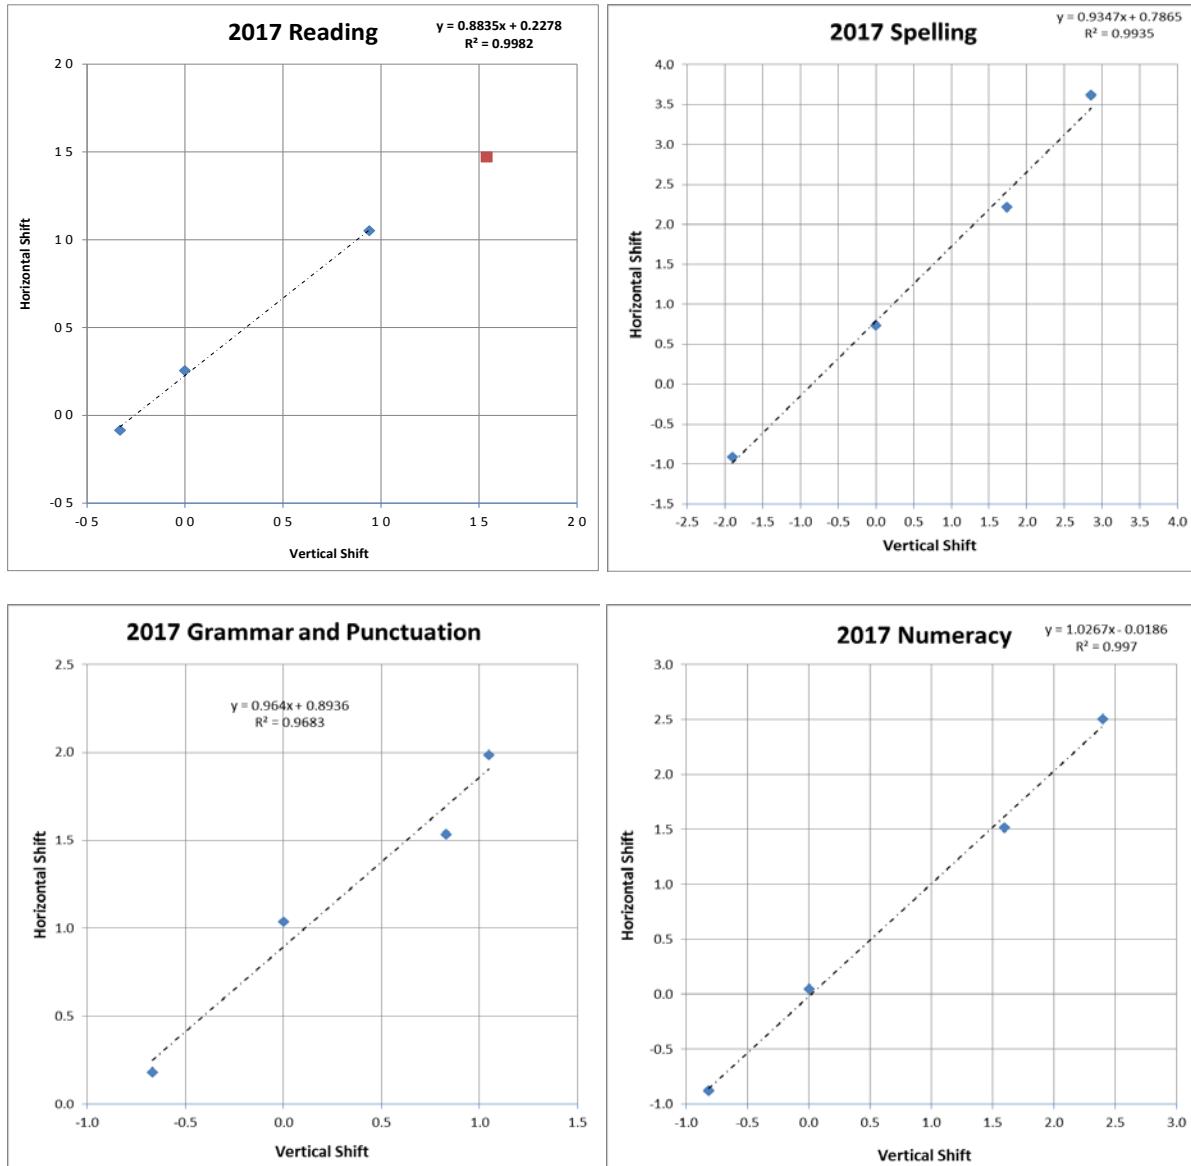

The equating process that has been used in previous years of NAPLAN is designed to take into consideration both vertical equating and horizontal equating. This process was used again to establish final locations of the reading, spelling, grammar and punctuation and numeracy tests on the NAPLAN reporting scales.

In this section, the results of the horizontal equating based on the equating sample are compared with the vertical equating results based on the 2017 calibration sample for each domain. Specifically, the vertical and horizontal shift constants are plotted for each of the four year-level tests in each domain. The regression-based comparison indicate where there is any divergence. Ideally, any case of divergence between direct and indirect equating would be resolved to the degree possible through checking each specific component of the linking process.

Figure 6.30 shows the plots of the relative positions of the four 2017 tests (Years 3, 5, 7 and 9) based on the common-person horizontal equating to the NAPLAN scale (vertical axes) against their relative positions centred at Year 5 based on the common-item vertical equating (horizontal axes). The regression equation and *R*-square are shown at the top-left corner of each plot. There is one plot for each of reading, spelling, grammar and punctuation, and numeracy.

Ideally, each regression line would have a slope of 1.0 and pass through all four points, showing perfect correspondence of the two methods. It can be seen from the plots that this is not always the case. The slope for reading was rather low at 0.83 with the vertical shift causing Year 9 to behave as a leverage point reducing the regression slope. When the Year 9 leverage point was

omitted, the slope increased to 0.88 and returned to the range of slope coefficients observed in previous NAPLAN equating cycles. The final regression equating shift was based on and used for Years 3, 5 and 7. Year 9 was equated using the method described in the following section.

**Figure 6.30. Regression-based combination of vertical and horizontal equating shifts**

Table 6.4 displays the intercepts and slopes for the regression-based combination of the vertical and horizontal equating.

**Table 6.4. Regression Intercepts and Slopes**

Regression Coefficient	Reading (Years 3, 5, 7)	Spelling	Grammar and Punctuation	Numeracy
Intercept	0.228	0.787	0.894	0.019
Slope	0.884	0.935	0.964	1.027

As in previous years, the final shifts were calculated using the regression lines of best fit

$$y = a + b \cdot x \quad (6.1)$$

where  $y$  is the final shift onto the NAPLAN scale;  $x$  is the Year-5 centred shift based on vertical equating;  $b$  is the regression slope; and  $a$  is the regression intercept.

The final, regression-based shifts for each domain calculated using Equation 6.1 are shown in Table 6.5 by year level.

**Table 6.5. Final Shifts Applied for Equating NAPLAN 2017 onto the NAPLAN Historic Scale**

Year Level	Reading	Spelling	Grammar and Punctuation	Numeracy
3	-0.065	-0.986	0.251	-0.858
5	0.228	0.787	0.894	-0.019
7	1.059	2.407	1.693	1.620
9	1.556*	3.448	1.905	2.441

\* Year 9 reading test linear equating shift.

### **Year 9 Reading**

Using the national scientific sample data, the results for Year 9 were examined further. It was found that the mean score for Year 9 reading was lower than expected compared to the results of previous years. ACARA undertook to investigate the matter, and based on this investigation, concluded that the distribution of the total correct scores in the 2017 reading tests had a distinctively different shape to that observed in previous NAPLAN cycles. The distribution was arrested at the top which meant that a smaller proportion of students achieved the top range of the available scores. Consequently, the proportion of students who attained Band 9 or Band 10 in 2017 was considerably smaller from that observed in previous years. This effect was limited only to the top end of the Year 9 reading distribution.

To address such a compression of the distribution at the top range of student ability the decision was made to rescale the NAPLAN 2017 Year 9 reading test outcomes to have the same mean and standard deviation that was in the NAPLAN 2016 Year 9 reading test. This equating method is referred to as the liner equating method (Kolen and Brennan, 2004). Its use is justifiable where the assumption that the total population of tests takers are functionally equivalent. Given the size of the NAPLAN Year 9 cohort and the stability of the longitudinal trends in Year 9 the method's assumptions and use was just. ACARA's Measurement Advisory Group reviewed the Year 9 reading test functioning and evaluated the proposed method for addressing the observed Year 9 test effect and agreed that:

1. All equating procedures were properly carried out and had no impact on the observed outcomes of the Year 9 reading test.
2. The source of changes in the Year 9 reading outcomes were the 2017 test and test response data.
3. The data showed that the 2017 Year 9 reading test and its interaction with students' ability was outside of the variability in test performance observed for previous NAPLAN test cycles.
4. The 2017 reading test was not adequately measuring the full spread of Year 9 student ability owing to the interaction of the 2017 tests and item difficulties in the 2017 test and the ability of 2017 student cohort.

5. Given that there was little evidence to assume that the 2017 cohort was significantly different than previous cohorts that most likely source of the observed interaction was the 2017 test and its composition in terms of item difficulty and targeting.
6. Consequently, it is plausible and justifiable to assume that the distribution of performance in 2017 was the same as that of the 2016 cohort.

Following MAG endorsement, the final equating shift and the ability estimates distribution of 2017 Year 9 reading test were adjusted using the proposed linear equating method.

## **6.5 Calibration and Scaling of Writing**

### ***Background***

As noted earlier, in 2017 two persuasive writing tasks were administered as part of NAPLAN—one to Year 3 and 5 students and the other to Year 7 and 9 students. The rating of NAPLAN 2017 writing for all participating year groups was based on the same 10 criteria and the same marking guide used for the writing tests in 2011 through 2015.

### ***Raw score summary***

Table 6.6 present the distributions of raw scores by year level for both calibration sample and census data, which indicate that the distributions of raw scores were very similar from 2011 to 2017.

**Table 6.6. NAPLAN 2011 – 2017 Writing Raw Score Distribution by Year Level**

Test Year	Year Level	Calibration Sample			Census Data		
		N	Mean	SD	N	Mean	SD
2011	3	1066	18.14	5.08	252901	19.42	5.12
	5	1131	23.56	5.90	258563	24.74	5.79

### ***Equating Methodology***

The equating of NAPLAN 2017 writing to the NAPLAN writing scale was conducted by the University of Western Australia (UWA) using pairwise comparison methodology. Appendix M provides a summary of the UWA NAPLAN 2017 Pairwise Equating Summary.

Figure 6.31 shows the comparison graph of criterion delta locations between 2011 and 2017 and Figure 6.32 shows the comparison graph of criterion delta locations between 2015 and 2017. The graphs, with identity lines, show that the 2017 deltas are very similar to those from 2011 and from 2015.

The decision taken was to use base year item parameters and the corresponding raw score to scale score estimates for person locations for the purpose of reporting.

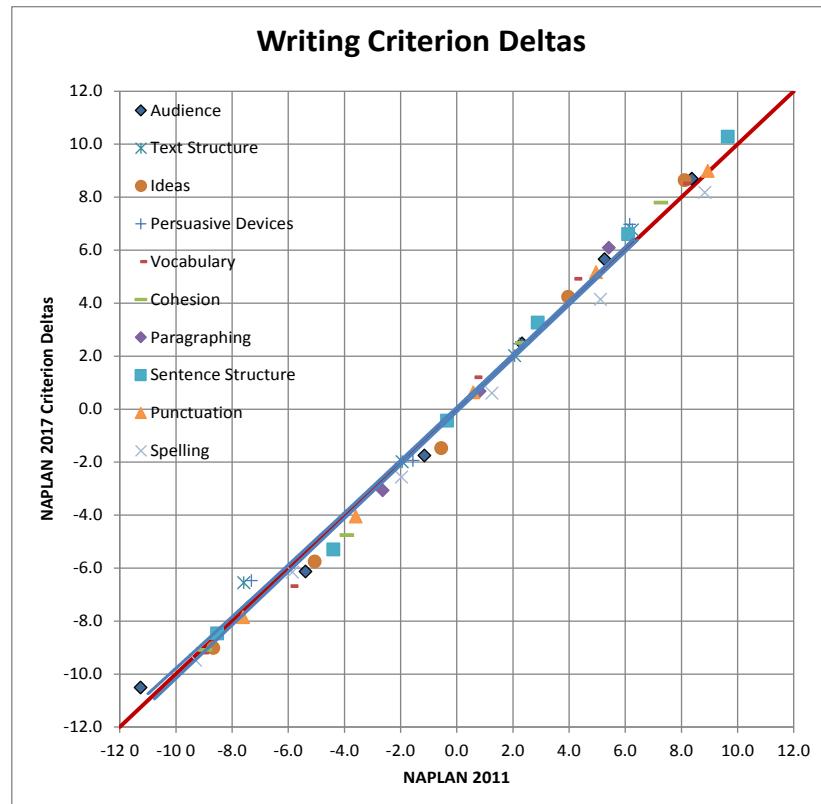

Figure 6.31. Writing deltas for 2017 against 2011

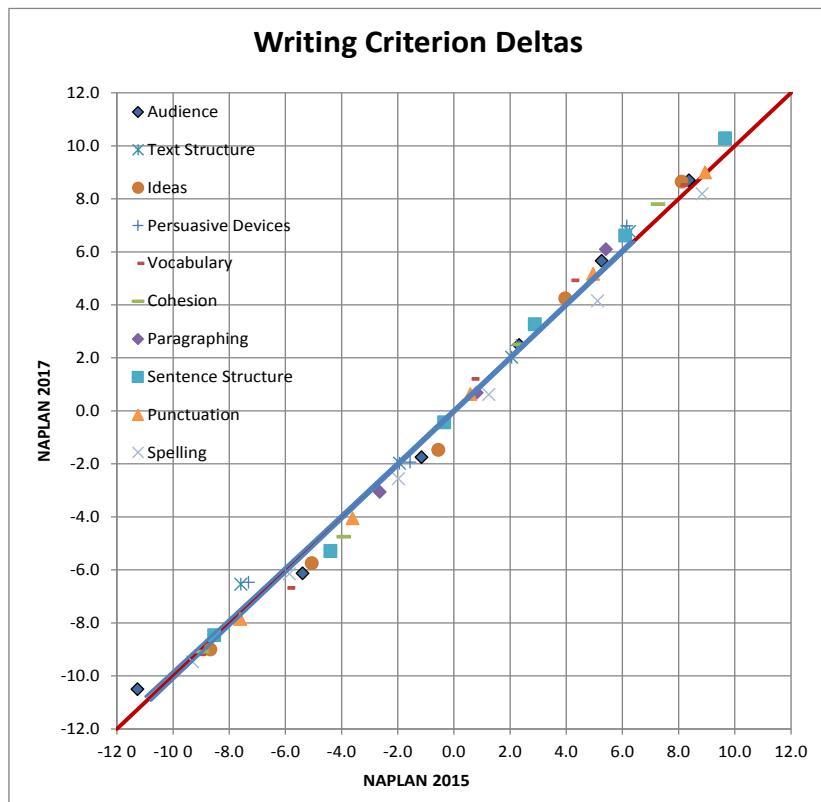

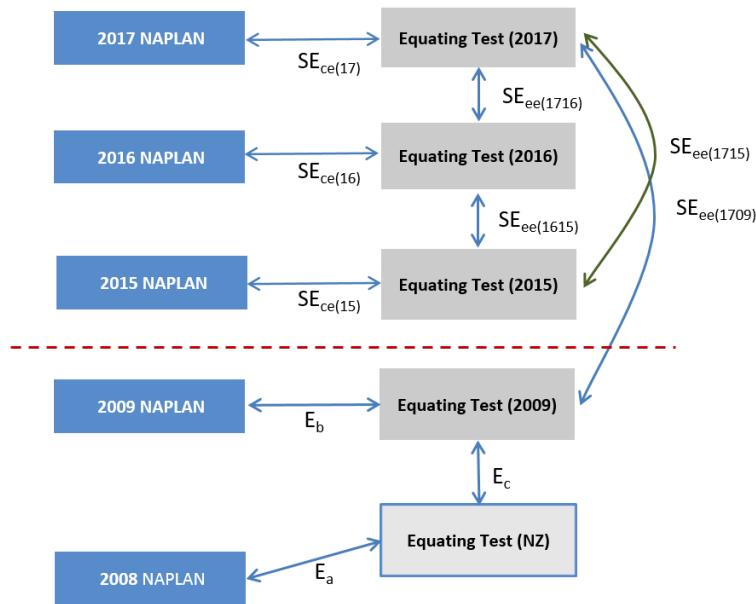

Figure 6.32. Writing deltas for 2017 against 2015

## 6.6 Estimating Standard Errors of Equating

Multiple steps were involved in the equating of reading, spelling, grammar and punctuation and numeracy. A standard error was estimated for each step. The standard errors were combined on the assumption that the errors from the steps are independent.

The errors considered in the equating processes over the course of the program are shown in Figure 6.33.

**Figure 6.33. Writing deltas for 2017 against 2015**

For each domain and year level:

- SE<sub>a</sub> is the standard error associated with equating the offshore equating form and the 2008 NAPLAN test;
- SE<sub>b</sub> is the standard error associated with equating the onshore equating form and the 2009 NAPLAN test;
- SE<sub>c</sub> is the standard error associated with equating the offshore and onshore equating forms;
- SE<sub>ce(17)</sub> is the standard error associated with equating the NAPLAN 2017 test with the equating test (calibration to equating);
- SE<sub>ce(16)</sub> is the standard error associated with equating the NAPLAN 2016 test with the equating test (calibration to equating);
- SE<sub>ce(15)</sub> is the error associated with equating the NAPLAN 2015 test with the equating test; and
- SE<sub>ee(1716)</sub> is the standard error associated with equating the 2016 and 2017 administrations of the equating test (equating to equating); and so forth

For reporting results of NAPLAN 2017, the equating errors for equating the 2017 scale to the 2016, 2015 and 2008 scales are estimated by combining the relevant standard errors as follows:

$$SE_{2017 \text{ to } 2016} = \sqrt{SE_{ce(16)}^2 + SE_{ce(17)}^2 + SE_{ce(1716)}^2}$$

$$SE_{2017 \text{ to } 2015} = \sqrt{SE_{ce(15)}^2 + SE_{ce(17)}^2 + SE_{ce(1715)}^2}$$

$$SE_{2017 \text{ to } 2008} = \sqrt{SE_a^2 + SE_c^2 + SE_{ee(1709)}^2 + SE_{ce(17)}^2}$$

It was decided in 2011 to include component *c* of equating error, associated with the offshore testing, in equating back to 2008. The reason is that even though most items are in common with the equating form in 2009 and subsequent years, a different population of persons attempted the items in the offshore equating exercise. Component *c* was included again in 2017.

Table 6.7 shows the standard errors of equating associated with each test domain and year level in logits.

**Table 6.7. Standard Errors of Equating**

Domain	Year	2017 to base	2017 to 2016	2017 to 2015
Reading	3	0.067	0.049	0.061
	5	0.078	0.070	0.070
	7	0.053	0.031	0.040
	9	0.054	0.032	0.033
Writing	3	0.198	0.198	0.147
	5	0.198	0.198	0.147
	7	0.198	0.198	0.147
	9	0.198	0.198	0.147
Spelling	3	0.092	0.071	0.065
	5	0.099	0.060	0.065
	7	0.096	0.056	0.048
	9	0.098	0.060	0.064
Grammar and Punctuation	3	0.092	0.061	0.069
	5	0.105	0.056	0.058
	7	0.090	0.045	0.050
	9	0.081	0.053	0.048
Numeracy	3	0.069	0.051	0.048
	5	0.071	0.039	0.048
	7	0.052	0.037	0.035
	9	0.054	0.036	0.035

\*The base year for grammar & punctuation, numeracy, reading and spelling is 2008; base year for writing is 2011.

\*\*The Writing equating error was calculated based on the pairwise equating data in a manner consistent with keeping the item parameters constant.

The equating errors are taken into account, together with sampling and measurement errors, in estimating the standard errors used to determine statistical significance in the comparisons between mean scores across years in NAPLAN reports. The equating errors are not included

when estimating standard errors of estimates used to determine statistical significance in the comparisons between mean scores of different subgroups on NAPLAN 2017. In estimating standard errors for percentages at or above minimum standards, the equating errors were applied to the cut-points for proficiency bands.

## CHAPTER 7 REPORTING OF NAPLAN PERFORMANCE IN 2017

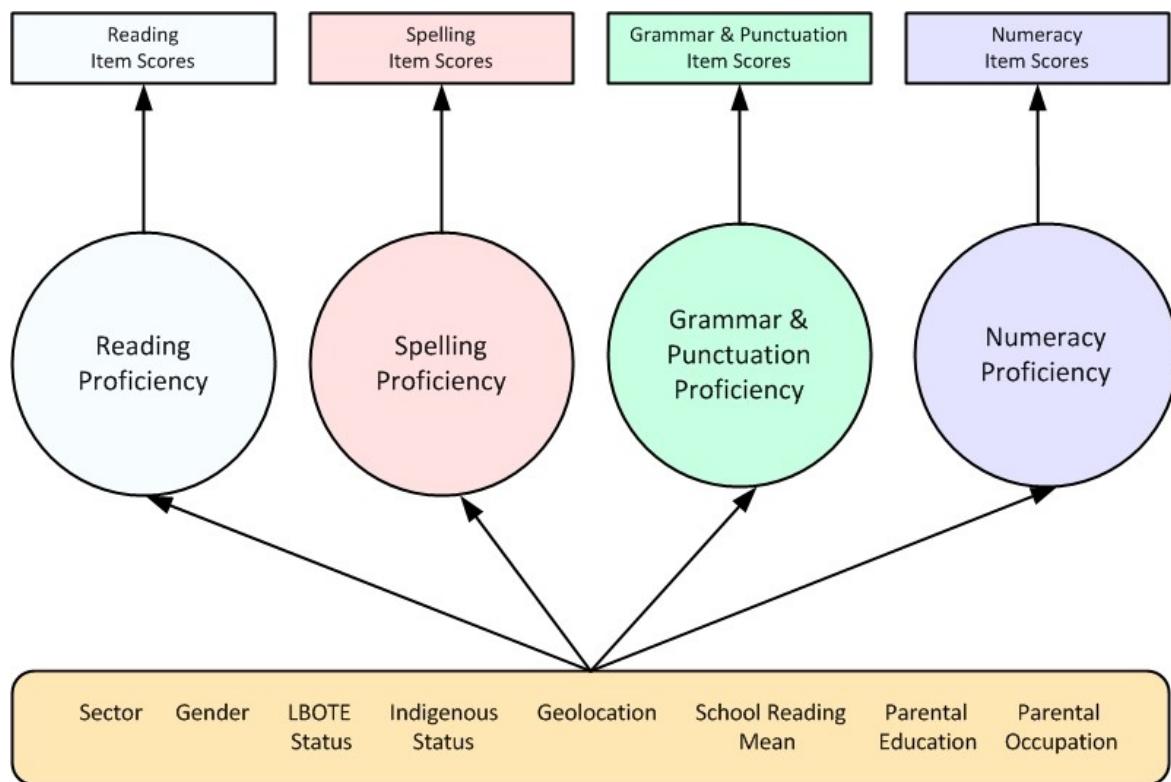

NAPLAN 2017 achievement scores for reading, numeracy, spelling and grammar and punctuation were reported on the NAPLAN vertical scales as they were for NAPLAN administrations 2008 through 2016, while the NAPLAN 2017 achievement scores in writing used the same scale as the 2011 through 2016 assessments. This was made possible by applying the equating shifts and scale transformations necessary to bring the 2017 logit scores for each test in each domain onto the NAPLAN reporting scale, the details of which are reported in previous chapters. As in previous years, student results were reported against proficiency bands. The cut-points for proficiency bands established for NAPLAN 2008 reporting were used for NAPLAN 2017 as in previous cycles. The scale equating enabled achievement scores to be compared across NAPLAN administration years for reading, numeracy, spelling and grammar and punctuation and across 2011 to 2017 for writing.

### 7.1 Proficiency Estimates

As for previous NAPLAN cycles, population statistics for the reporting of NAPLAN 2017 achievement at the state/territory and national levels were estimated using *plausible values*. In this approach, student achievement is not estimated as a single value or point estimate such as one would do using weighted likelihood estimates (WLEs). Instead, a range of values from the posterior distribution is generated for each student. The plausible values represent a random selection from this distribution.

Using plausible value methodology to obtain proficiency estimates for populations and subpopulations is a standard approach in large scale national assessment programs, as well as in international assessment programs such as the Programme for International Student Assessment (PISA). An introduction to the conceptual basis of plausible values and calculations involving them in the context of PISA is described in a report from the Organisation for Economic Co-operation and Development (OECD, 2009).

Five plausible values were drawn for each student in each domain using *ACER ConQuest*. The plausible values for reading, spelling, grammar and punctuation and numeracy were drawn concurrently, based on a multidimensional item response model with latent regression (Wu, et al, 2007). In drawing the plausible values, conditioning variables were used as regressors in the model. The regression model used 2017 was the same as that used in previous NAPLAN cycles. The conditioning variables used in the model were gender, LBOTE status, Indigenous status, parental education, parental occupation, school geolocation, school sector, and the school reading WLE average score as a measure of average proficiency at the school level. A diagrammatic representation of the model is shown in Figure 7.1.

**Figure 7.1. Conditioning variables for the multidimensional item response model with latent regression**

The categorical variables (gender, LBOTE status, Indigenous status, parental education, parental occupation, school geolocation and school sector) were included in the model using what are referred to as *indicator variables*. In this approach, a single categorical variable is recoded by multiple indicator variables that are coded with a “1” to denote the presence of a category level, and a “0” to denote the absence of the category level. In general, it takes  $k - 1$  indicator variables to recode  $k$  category levels. For example, the variable gender was designated as having three categories, namely, *male*, *female*, and *missing*. The categories of gender were recoded for each student using one indicator variable to denote *female*, and a second indicator variable to denote *missing*. If the pair of indicator variables had the values 1 and 0 respectively, this meant that the gender category for the student was *female*; when the indicator variables had the values of 0 and 1, then the gender category was *missing*. When both indicators were 0, this indicated that the gender category for the student was *male*. In a similar fashion, this approach was applied to the other categorical variables used in the model.

Due to differences between states/territories with respect to the distributions of students across these variables, some categories of these conditioning variables may not have been observed or may have been perfectly correlated with other conditioning variables. For example, during one NAPLAN administration, in year level 3, the indicator for school geolocation indicating whether this information was missing was perfectly correlated with school sector indicator for home-schooled students. In these cases, categories of conditioning variables were combined or conditioning variables were removed from the generation of plausible values for the state/territory in question.

The plausible values were drawn separately for each jurisdiction to allow for the possibility of different relationships between proficiency estimates and conditioning variables across the

jurisdictions. Plausible values were drawn for all students, including absent students and students that had withdrawn from taking the test. Exempt students were not included.

The plausible values for writing were drawn concurrently for Years 3, 5, 7 and 9 and separately for each state/territory. In this calibration, school sector, gender, LBOTE status, Indigenous status, parental education, parent occupation, school geolocation, year level and the school writing WLE mean score were included as conditioning variables. The WLE mean score of a school was calculated based on students who participated in the writing test. For schools with no student who participated in the writing test, the school WLE average score was set at the jurisdiction mean.

For each domain and each year level, the five sets of plausible values were used to calculate means, standard deviations, percentiles and percentages of students within proficiency bands at the jurisdictional and national level. The statistics were calculated for the full population of students and by selected background variables, such as gender, language background and aboriginal status, and including the absent students and the students that had withdrawn from taking the test. The plausible values were also used to obtain estimations of measurement errors.

Estimates of sampling and measurement errors were combined to obtain final standard errors for the performance statistics reported for the census data. The standard errors were used to determine statistical significance of mean differences and percentage differences in NAPLAN 2017 performance in the reports. Relevant equating errors were taken into consideration, in addition to sampling and measurement errors, to estimate standard errors and evaluate statistical significance of mean and percentage differences between 2017 and 2016 as well as 2017 and 2008 for reading, numeracy, spelling, and grammar and punctuation and between 2017 and 2016 as well as 2017 and 2011 for writing.

## **7.2 Reporting NAPLAN 2017 Student Achievement on NAPLAN Reporting Scales**

The plausible values were drawn on the delta-centred scale for each test. Before the scaling was finalised, the 2017 latent distributions of student achievement were estimated using the plausible values drawn for the 2017 scientific sample, with the student weights applied. The means and standard deviations calculated from the sample provided estimates of the population latent distributions before the full cohort data were available.

The standard deviations obtained for 2017 were then compared to the population standard deviations of the domain's *base year*. For the standard deviations for the reading, numeracy, spelling and grammar and punctuation domains, the base year was 2009, while for writing, it was 2011. The ratio of the base year standard deviation to the 2017 standard deviation was calculated for each domain at each year level. A ratio that was greater than 1.0 indicated that the base year test spread the students out more than the 2017 test did for that domain at the particular year level. Conversely, a ratio that was less than 1.0 indicated that the 2017 test spread the students out more than the base year test for that domain at that particular year level.

These ratios of standard deviations were then used as scaling factors to correct for the different distributions.

For each domain at each year level, a linear transformation was applied to scores on the delta-centred logit scale to correct for the spread in the scores and to apply the appropriate equating

constant to put the scores onto the NAPLAN vertical domain logit scale. The scaling factor was applied for each domain at each year level, with the estimated population mean as the pivot point of the transformation.

For each domain at each year level, a logit score was transformed as follows:

$$\text{TransformedLogitScore} = SF \cdot (\text{LogitScore} - \text{LocalMean}) + \text{LocalMean} + \text{EqShift} \quad (7.1)$$

where

*LocalMean* = the mean of the latent distribution estimated using the 2017 scientific sample based on the delta-centred item parameters,

*SF* = the scale factor that was calculated from the ratio of the base year standard deviation to the 2017 standard deviation.

*EqShift* = the equating constant pertinent for the domain at the particular year level.

The values for *LocalMean*, *SF*, and *EqShift* are presented in Table 7.1 for each year level by domain.

The same transformation was applied to the WLE ability logit scores in the score equivalence table, the item parameters and the plausible values. For writing, the scaling factor and equating shifts were set to one and zero, respectively, in Table 7.1.

For each domain, estimates in logits were transformed to the NAPLAN reporting scale scores established in NAPLAN 2008 as follows:

$$\text{NAPLANScaleScore} = 100 \cdot (\text{Score}_{\text{logit}} - \text{DomainMean}) / (\text{DomainStdDeviation}) + 500 \quad (7.2)$$

where *DomainMean* and *DomainStdDeviation* are the estimated overall domain mean and overall domain standard deviation calculated using the 2008 scientific sample. These are presented in Table 7.2.

It should be noted that for each domain, the standard error (SE) in logits associated with each WLE estimate was transformed to the NAPLAN scale metric as follows:

$$SE_{\text{NAPLANScale}} = 100 \cdot \frac{SE_{\text{logit}}}{\text{DomainStdDeviation}}$$

**Table 7.1. Parameters for transforming the 2017 logit scores to the NAPLAN Scales**

<b>Year</b>	<b>Domain</b>	<b>Local Mean</b>	<b>Scaling Factor</b>	<b>Equating Shift</b>

### 7.3 Score Equivalence Tables

To facilitate rapid generation of student and school reports, score equivalence tables for converting raw scores to weighted likelihood estimates (WLEs) and their corresponding NAPLAN scale scores were generated for each test and provided to the jurisdictions' Test Administration Authorities. The equivalence tables enable the TAAs to locate individual students on NAPLAN reporting scales using the raw scores for each test. The NAPLAN 2017 score equivalence tables are presented in Appendix K. The tables show the scores and the associated standard errors in logits and in NAPLAN scale scores. For Year 7 and Year 9 numeracy, three separate tables were provided. The first was for the overall numeracy test, the second for the non-calculator form and the third for the calculator form. The second and third tables were for allocating scores to students who sat only one of the forms.

The preliminary national mean, the 20th percentile score and the 80th percentile score (to give the approximate range of the middle 60 percent) based on the calibration sample were provided for each domain and year level for reporting to schools and parents.

### 7.4 Reporting against Proficiency Bands

As in previous NAPLAN administrations, student achievement was also reported against proficiency bands for each domain. The ten proficiency bands on the NAPLAN reporting scales had the cut-points set at equal intervals apart. Year 3 results were reported against Band 1 to Band 6, Year 5 results reported against Band 3 to Band 8, Year 7 results reported against Band 4 to Band 9, and Year 9 results reported against Band 5 to Band 10. The cut-points for the proficiency bands were developed in 2008 and used in reporting the NAPLAN 2017 results.

The NAPLAN reporting scale for each domain was standardized to be similar in length. Each scale has the same number of proficiency bands and the same nine cut-points on the transformed scales. The performance distribution at each year level could span approximately six bands. A student whose proficiency fell within a specific band would be expected to score at least 50% correct on a test made up of items that fell into that band.

The cut scores separating the proficiency bands are presented in Table 7.3. The cut scores are different on the logit scales for the domains but are the same on the transformed NAPLAN scales.

**Table 7.3. Proficiency Bands Cut Scores**

Band Cut Score	Scale Score	Logits				
		Reading	Writing	Spelling	Grammar and Punctuation	Numeracy
9/10	686	3.928	7.380	5.821	3.783	3.907
8/9	634	3.155	5.629	4.457	3.076	3.042

Figure 7.2 depicts how student results are reported against the proficiency bands. Results in each year level are reported against six bands. For Year 3, scores above Band 6 are reported against Band 6. For Year 5, scores above Band 8 are reported against Band 8 and scores below Band 3 are reported against Band 3. For Year 7, scores above Band 9 are reported against Band 9 and scores below Band 4 are reported against Band 4. For Year 9, scores below Band 5 are reported against Band 5.

The yellow band for each year level in Figure 7.2 is identified as the national minimum standard for that year level. Band 2 is the national minimum standard for Year 3, Band 4 for Year 5, Band 5 for Year 7 and Band 6 for Year 9. Students are deemed to have performed above national minimum standard if their scores fall in the green bands at their respective year level and below national minimum standard if their scores fall in the orange band.

## 7.5 National Reports

The NAPLAN 2017 Summary Information was released in August 2017. The summary information provides results in each domain at each year level and by state/territory and nationally. This information was released around the same time that student reports were distributed to parents. The National Report released in December 2017 includes subgroup results by gender, language background, Indigenous status, geolocation, parental education and parental occupation.

## Purpose

The purpose of this report is to provide information regarding the 2017 NAPLAN Calibration and Equating Samples that complements existing NAPLAN technical documentation. It should be read in conjunction with the *NAPLAN 2017 Calibration Sample Weighting.pdf*.

These samples explicitly relate to the paper based version of NAPLAN. Schools and students participating in the online assessment were excluded from the calibration and equating samples in 2017.

## Sample frame

### Primary and Secondary samples

The NAPLAN Calibration and Equating Samples each consist of two sub-samples. For the Calibration Sample, one sample was drawn for the Primary year levels and the other sample for the Secondary year levels. This same procedure was also followed for the NAPLAN Equating Sample. Figure 1 illustrates the relationship between NAPLAN Year Levels, State/Territory and Primary and Secondary Schooling.

Year 7 has been treated as a secondary year level for QLD and WA since 2015. South Australia (SA) was the only state where Year 7 was included as a primary year level.

In 2017, ACT was excluded from both the calibration and equating samples as directed by ACARA given that this jurisdiction had a very high proportion of schools participating in the online version of the assessment.

State/Territory	Year 3	Year 5	Year 7	Year 9
ACT	Primary	Secondary		
NSW				
NT				
TAS				
VIC				
QLD				
WA				
SA	Primary		Secondary	

Figure 1: Relationship between state/territory, NAPLAN year levels and Primary/Secondary Schooling.

For each sampled school, all students in the target year levels were included in the calibration sample. For the Primary sample, this consisted of Year 3 and Year 5 students in all states and territories as well as Year 7 students in SA (see Figure 1). In relation to the Secondary sample, the target year levels were Year 7 and Year 9 except for SA whose target year levels consisted of Year 9 students only.

### Source data

ACARA provided a list of Australian schools which included the number of students enrolled at each school in Years 3, 5, 7 and 9 in 2016. Additional demographic information such as state, sector, geographic location and aggregate NAPLAN performance data was also provided.

### Exclusions

Schools were excluded from the calibration and equating sample if any of the following conditions were true:

- The school was an ACT school

- The school was participating online (i.e., field ***Confirmed\_NAPLAN\_Online\_2017*** = 'Y')
- If there were no enrolments (zero or missing value) in all the target year levels
- If the school had a missing value in either the ***NAPLAN2016\_Performance*** field or ***NAPLAN\_Total\_Cohort\_3579*** field
- If the school was a 'very remote' school in NSW or WA.

### ***Equating sample additional exclusions***

In addition to the general exclusions mentioned previously, all remote and very remote schools were excluded in each state/territory from the equating sample frame. Schools were also excluded if the enrolment was less than the desired target cluster size of 25 students for Primary year levels and 20 students for Secondary year levels. Schools were also excluded if the source data field ***ACARA\_Eligible\_Primary*** or ***ACARA\_Eligible\_Secondary*** was equal to 'N' for the primary and secondary samples respectively.

### **Measures of enrolment size**

The measure of enrolment size for a year level was taken to be the enrolment size in the equivalent year level for the calendar year prior. That is, the 2016 enrolment numbers contained in the source data were used to estimate 2017 enrolment sizes. For example, Year 3 enrolment sizes in the 2016 source data were used as the estimate for 2017 Year 3 enrolment sizes.

A change to school starting age in QLD meant that the enrolment numbers for Year 9 students in 2016 are lower than usual (approximately 42,000 students instead of a typical cohort size of approximately 59,000 students). To accommodate this, the QLD Grade 8 enrolments from the sample frame (which is based on 2016 enrolments) were used as the estimate for the 2017 Year 9 enrolments for QLD.

### **Calibration sample frames**

The calibration sample frame consisted of 7071 schools with Primary year levels and 2436 schools with Secondary year levels.

### **Equating sample frames**

The equating sample frame comprised 2983 primary schools and 1058 secondary schools. Sampled schools were then assigned to one of three assessment domains (Reading, Language Conventions or Numeracy).<sup>1</sup>

### **Sampling methodology**

Once sample frames had been created, four samples were drawn: Calibration Primary, Calibration Secondary, Equating Primary and Equating Secondary.

The same general methodology was applied to select schools for each of the four samples. Firstly, this involved explicit and implicit stratification of sample frames. Schools were then selected for inclusion in the sample using random start systematic sampling where schools within each explicit stratum had an equal probability of selection.

---

<sup>1</sup> The equating sample does not include the Writing domain.

## Explicit stratification

As previously mentioned, ACT was excluded from the calibration and equating samples so there was a total of seven jurisdictions available for sampling instead of the usual eight jurisdictions.

For the calibration sample, sample frames were split into 21 explicit strata with each stratum containing a state/territory (n=7) and sector (n=3) combination.

For the equating sample, sample frames were split into 17 explicit strata where NT and TAS were 2 strata<sup>2</sup> while the remaining states (n=5) were split by sector (n=3) into the remaining 15 explicit strata.

## Implicit stratification

Within each explicit stratum, schools were implicitly stratified by the variables detailed in Table 1.

Table 1: Implicit stratification variables

Implicit Stratification Variable	Description
<b>Sector</b>	School sector (Catholic, Government, Independent)
<b>SchtypeID</b>	An indicator denoting the inclusion (or absence of) year 7 students in the sample.
<b>Geolocation</b>	Geographic location based on ABS remoteness code provided by ACARA
<b>NAPLAN performance</b>	For each school, a numeric value was provided by ACARA representing performance on NAPLAN across all year levels and domains at the school.
<b>MeanENR</b>	Average of student enrolments across the target year levels within each school.

Further information relating to each implicit stratification variable has been provided below.

### *Sector*

Sector was included as an implicit stratification variable in the instances it wasn't used as an explicit stratification variable.

### *SchtypeID*

SchtypeID was named PriSchtype for primary samples and SecSchtype for secondary samples. The coding scheme used here was consistent with 2016 procedures.

PriSchtype was set to 1 if the primary school had only year 7 students enrolled and no year 3 or 5 students (this only occurs in SA). Set equal to 2 for all other primary schools.

SecSchtype was set to 1 if the secondary school had no year 7 students but had more than five year 9 students (this only occurs in states other than SA). Set equal to 2 for all other secondary schools.

### *Geolocation*

In the provided files, the geolocation value is equivalent to the source data field **ABS\_Remoteness\_Code + 1**. The relationship between values is detailed in Table 2.

---

<sup>2</sup> An operational decision was made in 2016 to combine sectors for sampling purposes to reduce the burden on schools in smaller jurisdictions.

**Table 2: ABS Remoteness Code description and equivalent Geolocation value**

<b>ABS Remoteness Code</b>	<b>Geolocation value</b>	<b>Description</b>
<b>in supplied files</b>		
<b>0</b>	<b>1</b>	Major Cities of Australia
<b>1</b>	<b>2</b>	Inner Regional Australia
<b>2</b>	<b>3</b>	Outer Regional Australia
<b>3</b>	<b>4</b>	Remote Australia*
<b>4</b>	<b>5</b>	Very Remote Australia*

\* excluded from the equating sample

### **NAPLAN performance**

Within each state and territory NAPLAN performance values were condensed into five levels with approximately equal numbers of schools in each level within the state. The percentile scores used to create the performance levels within each state are included in Table 3.

For example, level 5 represents schools with NAPLAN performance values that ranked them above the 80<sup>th</sup> percentile of other schools in the same state/territory (e.g. in SA this was schools with values higher than 0.075). Level 4 denotes schools with a rank in their state/territory above the 60<sup>th</sup> percentile but less than or equal to the 80<sup>th</sup> percentile (e.g. in Victoria level 4 indicated that the school had a NAPLAN performance value above 0.077 but equal to or less than 0.313).

**Table 3: NAPLAN performance value cut-points for percentile groups**

<b>State/Territory</b>	<b>Percentiles (within state)</b>			
	<b>20</b>	<b>40</b>	<b>60</b>	<b>80</b>
<b>NSW</b>	-0.528	-0.243	0.000	0.270
<b>NT</b>	-2.626	-2.121	-0.949	-0.386
<b>QLD</b>	-0.566	-0.310	-0.121	0.116
<b>SA</b>	-0.579	-0.322	-0.145	0.075
<b>TAS</b>	-0.617	-0.350	-0.165	0.114
<b>VIC</b>	-0.339	-0.118	0.077	0.313
<b>WA</b>	-0.589	-0.320	-0.075	0.190

### **MeanENR**

For the Primary and Secondary samples, the average enrolment size was estimated by taking the mean of enrolments for each target year level where the enrolment size was greater than zero. For example, the Primary enrolment size for a school in SA was equal to the average enrolment across Years 3, 5 and 7 while for the other states/territories it is equal to the average enrolment across Years 3 and 5. In cases where there were no students in Year 5 for example, then the average was calculated using Years 3 students only (or Year 3 and Year 7 for SA schools). The definition of 'no students' in a year level was when the sample frame contained an enrolment total that was either zero or missing. It appears that zero may sometimes be used to indicate that a school does not cater for a year level while for other schools (especially small schools) zero may indicate that there are simply no enrolments for students in a particular year level for a given calendar year. The implication being that the mean ENR may be slightly overestimated for some small schools.

## Selecting schools

Within each explicit stratum schools were selected with equal probability. Further explanation of the steps used, including relevant sampling parameters, are detailed in Appendix B.

## Selected schools

The overall calibration sample sizes are equivalent to 2016 minus the number of schools usually sampled for ACT.

For the equating sample, an additional 2 schools were sampled at the primary and secondary levels for NSW, QLD and VIC to compensate for the schools usually included from the ACT. This was to ensure the overall number of expected responses per equating test item was consistent with past practice.

As shown in Table 4, the calibration sample comprised of 289 schools at the primary level and 283 schools at the secondary level. For the equating sample, 109 schools were selected at the primary level while there were 137 schools in the secondary equating sample.

**Table 4: Number of selected schools in each state and sample**

	Calibration Sample		Equating Sample	
	Primary	Secondary	Primary	Secondary
NSW	48	48	33	42
NT	25	17	6	2
QLD	48	48	19	28
SA	45	46	8	11
TAS	30	30	6	6
VIC	48	48	26	33
WA	45	46	11	15
<b>Total</b>	<b>289</b>	<b>283</b>	<b>109</b>	<b>137</b>

## Replacement schools

Up to two replacement schools were also selected for each sampled school. The overall numbers of replacement1 and replacement2 schools were close to, but slightly less than the number of selected schools (as shown in Table 5). In some cases, particularly in smaller states/territories, it was not possible to select any replacement schools. In some cases, only one replacement school could be selected. Selection of replacement schools are consistent with those used in PISA (OECD 2012 p67)<sup>3</sup>.

**Table 5: Number of selected and replacement schools**

Sample type	selected	replacement1	replacement2	Total
Calibration Primary	289	289	289	867
Calibration Secondary	283	280	271	834
Equating Primary	109	106	103	318
Equating Secondary	137	128	119	384

<sup>3</sup> OECD (2012), *PISA 2009 Technical Report*, PISA, OECD Publishing.  
<http://dx.doi.org/10.1787/9789264167872-en>

## Expected sample sizes

The expected number of students included in the calibration sample is equivalent to the sum of all enrolments at the target year levels for selected schools. The expected calibration sample sizes for 2017 are shown in Table 6. For example, approximately 11000 students are expected to be included in the calibration sample for Year 3 while 28000 students are expected to be included at Year 9. Secondary schools, in general, have higher enrolment numbers per school than primary schools and hence more secondary school students are expected for inclusion in the sample given the number of schools selected at each level (primary and secondary) is approximately equal. The total expected sample size of approximately 26000 students for Year 7 is comprised of students drawn from both the primary and secondary calibration samples.

**Table 6: Expected calibration sample sizes by year level**

Year	Sum ENR
<b>Year 3</b>	11181
<b>Year 5</b>	10488
<b>Year 7<sup>4</sup></b>	25610
<b>Year 9</b>	28077

For the equating sample, an indication of the likely number of students included in the sample was estimated by multiplying the number of schools by the target cluster size for each year level. These figures assume 25 students per class for the primary sample and 20 students per class for the secondary sample. As shown in Table 7, approximately 2700 students are sampled at each year level across the 3 domains.

**Table 7: Expected equating sample sizes by year level**

Year	Number of schools	Expected total sample size (R and LC and N)	Expected sample size per domain
<b>Year 3</b>	109	2725	908
<b>Year 5</b>	109	2725	908
<b>Year 7<sup>5</sup></b>	134	2720	907
<b>Year 9</b>	137	2740	913

Table 8 contains the number of schools included in the equating sample for each year level and domain.

<sup>4</sup> Comprising 1577 Year 7 students from the primary calibration sample and 24033 students from the secondary calibration sample

<sup>5</sup> Comprising 8 primary schools with Year 7 students (target cluster size of 25) and 126 secondary schools with Year 7 students (target cluster size 20)

**Table 8: Equating sample number of schools by domain and year level**

<b>Year</b>	<b>R</b>	<b>LC</b>	<b>N</b>
<b>Year 3</b>	36	37	36

<sup>6</sup> Comprising 3 R, 2 LC and 3 N primary schools and 42 R, 42 LC and 42 N secondary schools

## Appendix A

### Sample Frame

The ACARA sample frame totals displayed in Table 9 and Table 10 are based on the original file from ACARA after the exclusions common to both the calibration and equating samples had been removed. Hence, totals for ACT are not available.

The original sample frame provided by ACARA contains 2016 enrolment information. The number of schools per state/territory is shown in Table 9 compared to ABS 2016 totals. Please note, at the time of sampling, schools participating online had been confirmed in ACT (n=113), QLD (n=109), VIC (n=199) and WA (n=100).

**Table 9 Number of schools per state/territory**

State/territory	ABS All (2016) <sup>7</sup>	ACARA Sample Frame <sup>8</sup>
ACT	127	-
NSW	2918	2899

## Appendix B

### Sampling parameters

The sampling parameters used to draw the sample are provided in Table 13 . These can be used in conjunction with the sample frame to replicate selection of the samples. An explanation of the sample parameter variables is included in Table 12.

To select schools within each explicit sample frame, the selected schools are those whose row numbers within the sample frame belong to the set of integers produced by the following algorithm:

*for each integer ( $i$ ) in the range (0 to units) inclusive,*

*select the school if the row number for the school in the sample frame is equal to*

*$[(i + RN) \times interval]$  rounded to the nearest integer*

---

Table 12: Sample parameters glossary

Sample	One of the 4 samples drawn: CP=Calibration Primary; CS=Calibration Secondary; EP=Equating Primary; ES=Equating Secondary
strataID	Explicit strata id
State	state/territory
Sector	C=Catholic; G=Gov; I=Indep, A>All sectors.
cases	Number of schools in sample frame
units	Number of schools sampled (desired)
interval	sampling interval which is equal to cases / units
RN	random number between 0 and 1
inclprob	school inclusion probability (each school within an explicit stratum has the same inclusion probability) = units/cases
designweight	inverse of inclprob
Nsel	Number of schools sampled
Nr1	Number of 1st replacement schools

## Addendum

### Calibration sample addendum May 2017

The original calibration sample was drawn in February 2017 and the Equating and Calibration Sample files and technical report were provided to ACARA in March 2017. At the time of writing in March 2017, five TAAs had at least some schools which were expected to participate using the online assessment. By late April 2017 all TAAs had withdrawn from online testing. A supplementary calibration sample was drawn for ACT to minimise the impact this would have on the central analysis of data. The ACT sampling parameters are provided in Table 13.

Other than ACT, the other TAAs which intended to participate in the online assessments to some degree included QLD, SA, VIC, and WA. SA had not provided confirmation at the time of sampling regarding online schools and hence all SA schools were eligible for participation in the calibration sample at the time the sample was drawn. The number of schools excluded from the calibration sample because they had been confirmed as an online school in QLD, VIC and WA are shown in Table 15 (these are the schools with *Confirmed\_NAPLAN\_Online\_2017* = 'Y' in the source file provided by ACARA).

**Table 14: ACT calibration sampling parameters provided as a supplement in May 2017 due to withdrawal from online assessment participation**

Sample	strataID	State	Sector	Cases	units	interval	RN	inclprob	designweight	Nsel	Nr1	Nr2

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.  
In this analysis 2.69% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	4691
Mean	19.45
Standard Deviation	6.59
Variance	43.39
Skewness	-0.02
Kurtosis	-0.30
Standard error of mean	0.10
Standard error of measurement	2.66
Coefficient Alpha	0.84

-----  
The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.  
In this analysis 0.80% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	4727
Mean	23.68
Standard Deviation	6.71
Variance	45.05
Skewness	-0.28
Kurtosis	-0.56
Standard error of mean	0.10
Standard error of measurement	2.47
Coefficient Alpha	0.86

-----  
The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.  
In this analysis 0.66% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	3568
Mean	29.68
Standard Deviation	8.44
Variance	71.23
Skewness	-0.36
Kurtosis	-0.41
Standard error of mean	0.14
Standard error of measurement	2.82
Coefficient Alpha	0.89

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.  
In this analysis 0.50% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	3400
Mean	30.05
Standard Deviation	8.29
Variance	68.71
Skewness	-0.48
Kurtosis	-0.34
Standard error of mean	0.14
Standard error of measurement	2.90
Coefficient Alpha	0.88

-----  
The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.  
In this analysis 3.92% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	4678
Mean	11.42
Standard Deviation	6.70
Variance	44.89
Skewness	0.05
Kurtosis	-0.95
Standard error of mean	0.10
Standard error of measurement	1.84
Coefficient Alpha	0.92

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.  
In this analysis 2.74% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	3424
Mean	11.20
Standard Deviation	5.78
Variance	33.44
Skewness	0.02
Kurtosis	-0.63
Standard error of mean	0.10
Standard error of measurement	1.94
Coefficient Alpha	0.89

-----  
The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.  
In this analysis 3.03% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	4672
Mean	13.40
Standard Deviation	4.33
Variance	18.77
Skewness	-0.29
Kurtosis	-0.14
Standard error of mean	0.06
Standard error of measurement	2.25
Coefficient Alpha	0.73

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.  
In this analysis 1.66% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N 4726  
Mean 13.64  
Standard Deviation 4.30  
Variance 18.48  
Skewness 0.02  
Kurtosis -0.27  
Standard error of mean 0.06  
Standard error of measurement 2.20  
Coefficient Alpha 0.74

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.  
In this analysis 0.66% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	3571
Mean	12.48
Standard Deviation	4.49
Variance	20.12
Skewness	0.14
Kurtosis	-0.50
Standard error of mean	0.08
Standard error of measurement	2.09
Coefficient Alpha	0.78

=====

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.  
In this analysis 0.71% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	3424
Mean	13.82
Standard Deviation	4.10
Variance	16.80
Skewness	-0.28
Kurtosis	-0.25
Standard error of mean	0.07
Standard error of measurement	2.15
Coefficient Alpha	0.73

-----  
The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.  
In this analysis 1.35% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	4657
Mean	18.60
Standard Deviation	6.44
Variance	41.51
Skewness	-0.01
Kurtosis	-0.42
Standard error of mean	0.09
Standard error of measurement	2.36
Coefficient Alpha	0.87

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.  
In this analysis 0.82% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	4695
Mean	24.84
Standard Deviation	8.20
Variance	67.20
Skewness	-0.15
Kurtosis	-0.71
Standard error of mean	0.12
Standard error of measurement	2.55
Coefficient Alpha	0.90

---

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.  
In this analysis 0.16% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	3540
Mean	24.00
Standard Deviation	8.98
Variance	80.67
Skewness	0.11
Kurtosis	-0.56
Standard error of mean	0.15
Standard error of measurement	2.69
Coefficient Alpha	0.91

## APPENDIX D. ICC PLOTS

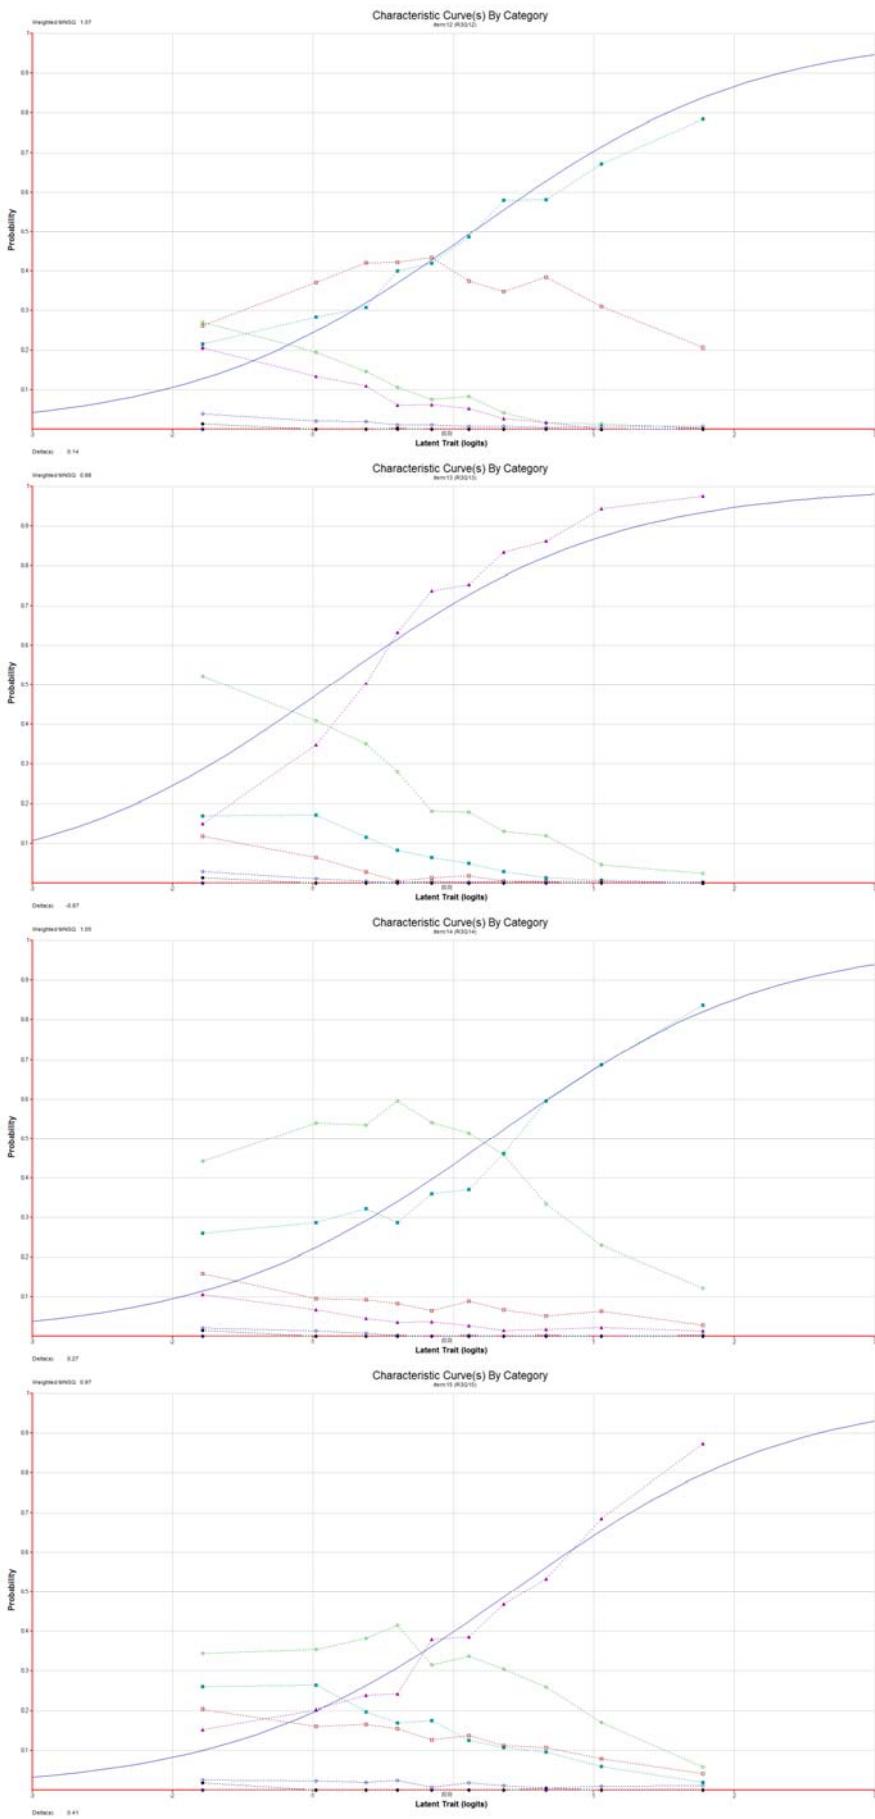

---

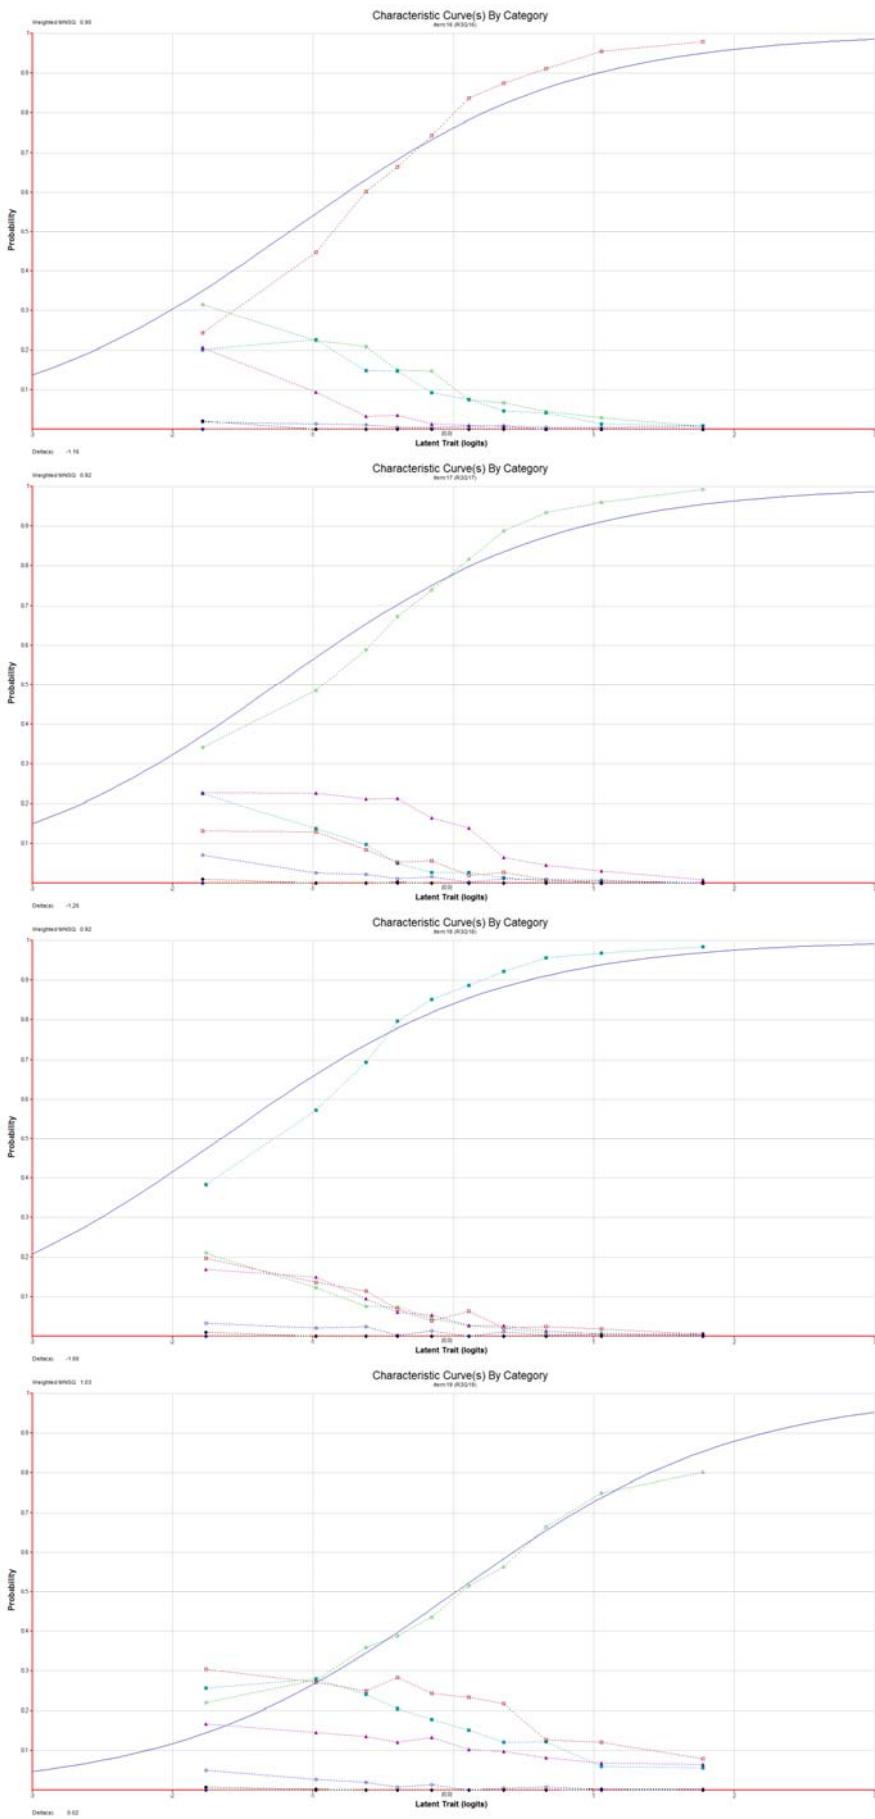

### D.1. Year 3 Reading

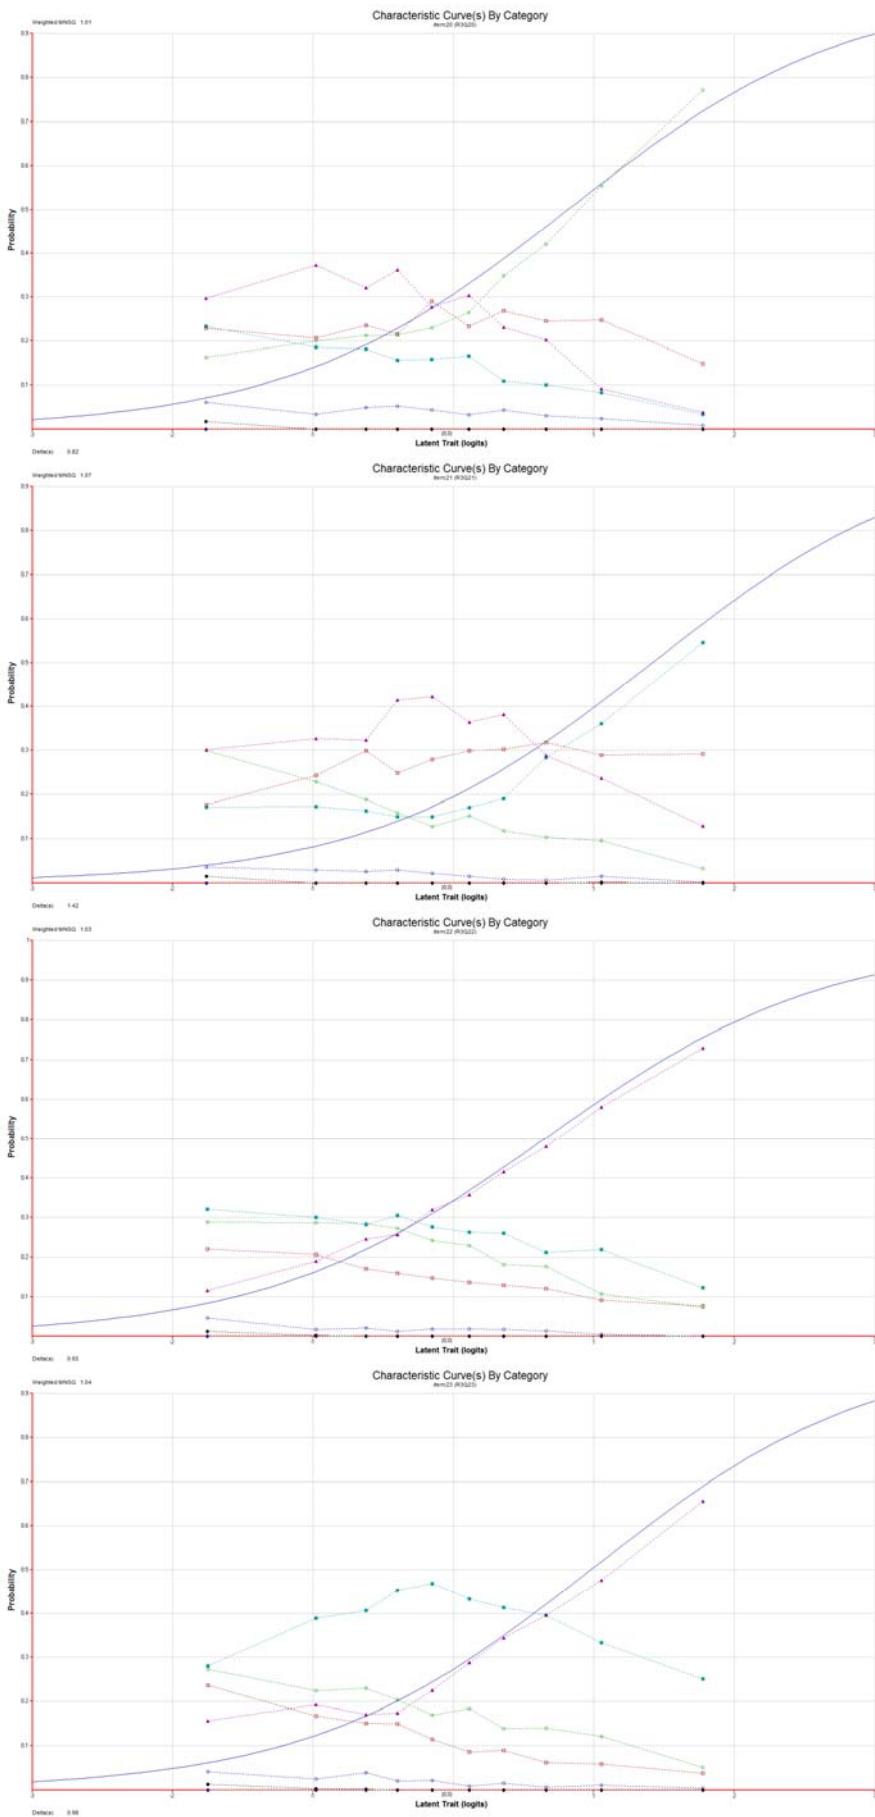

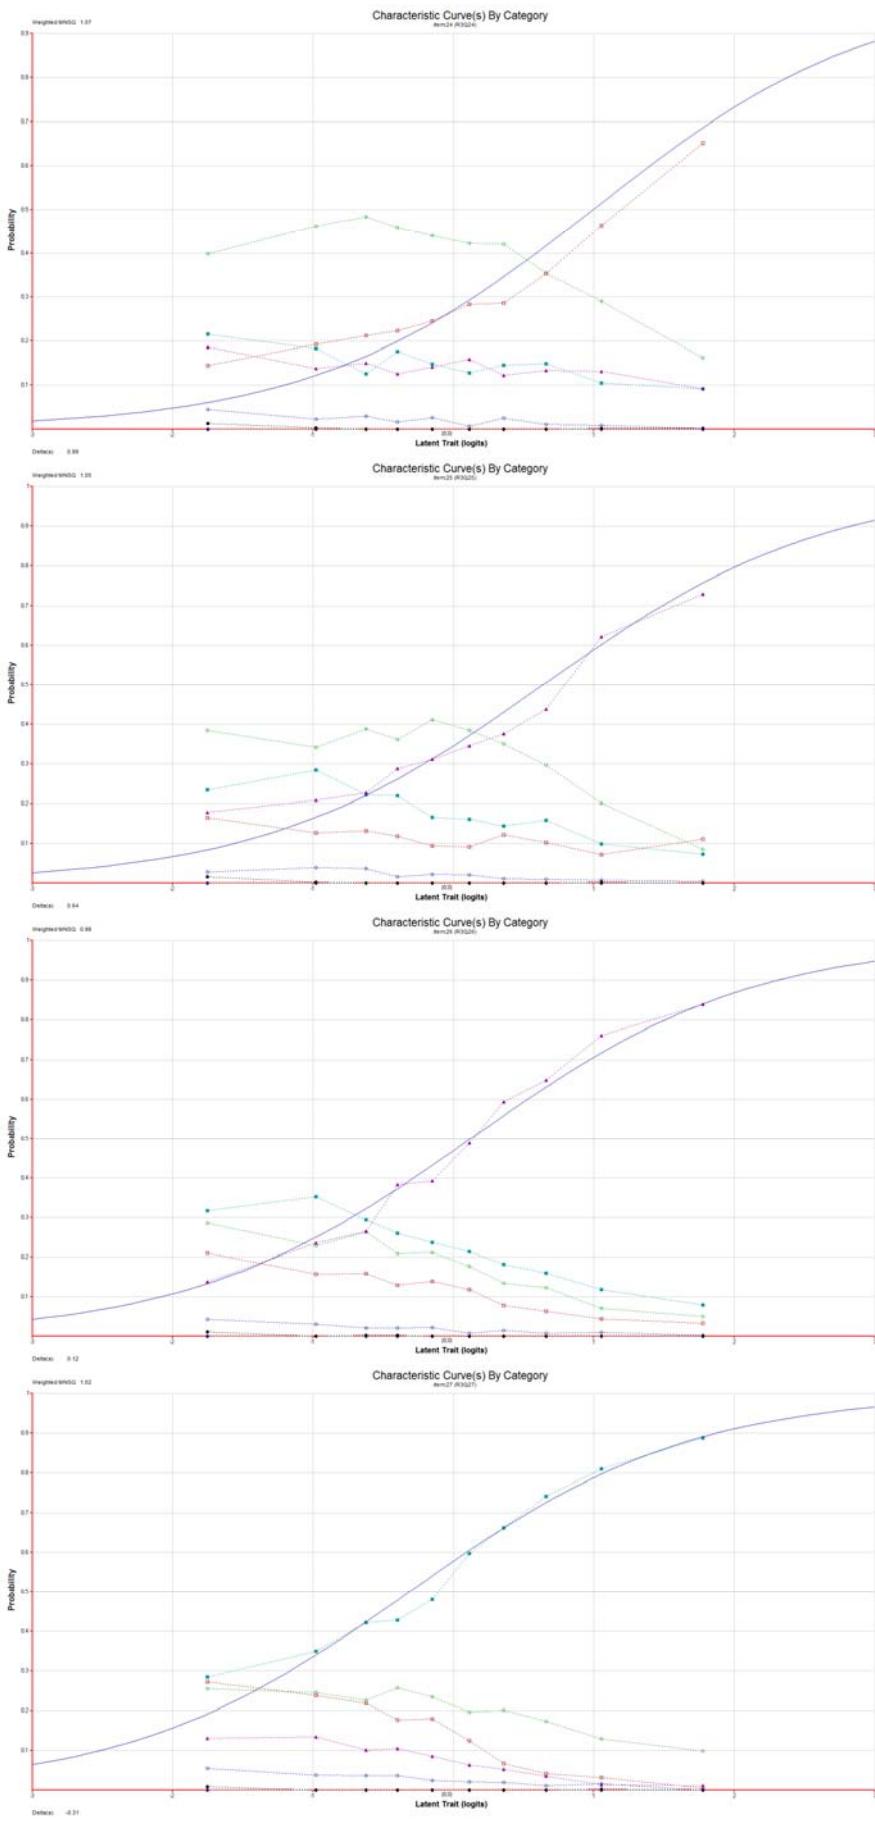

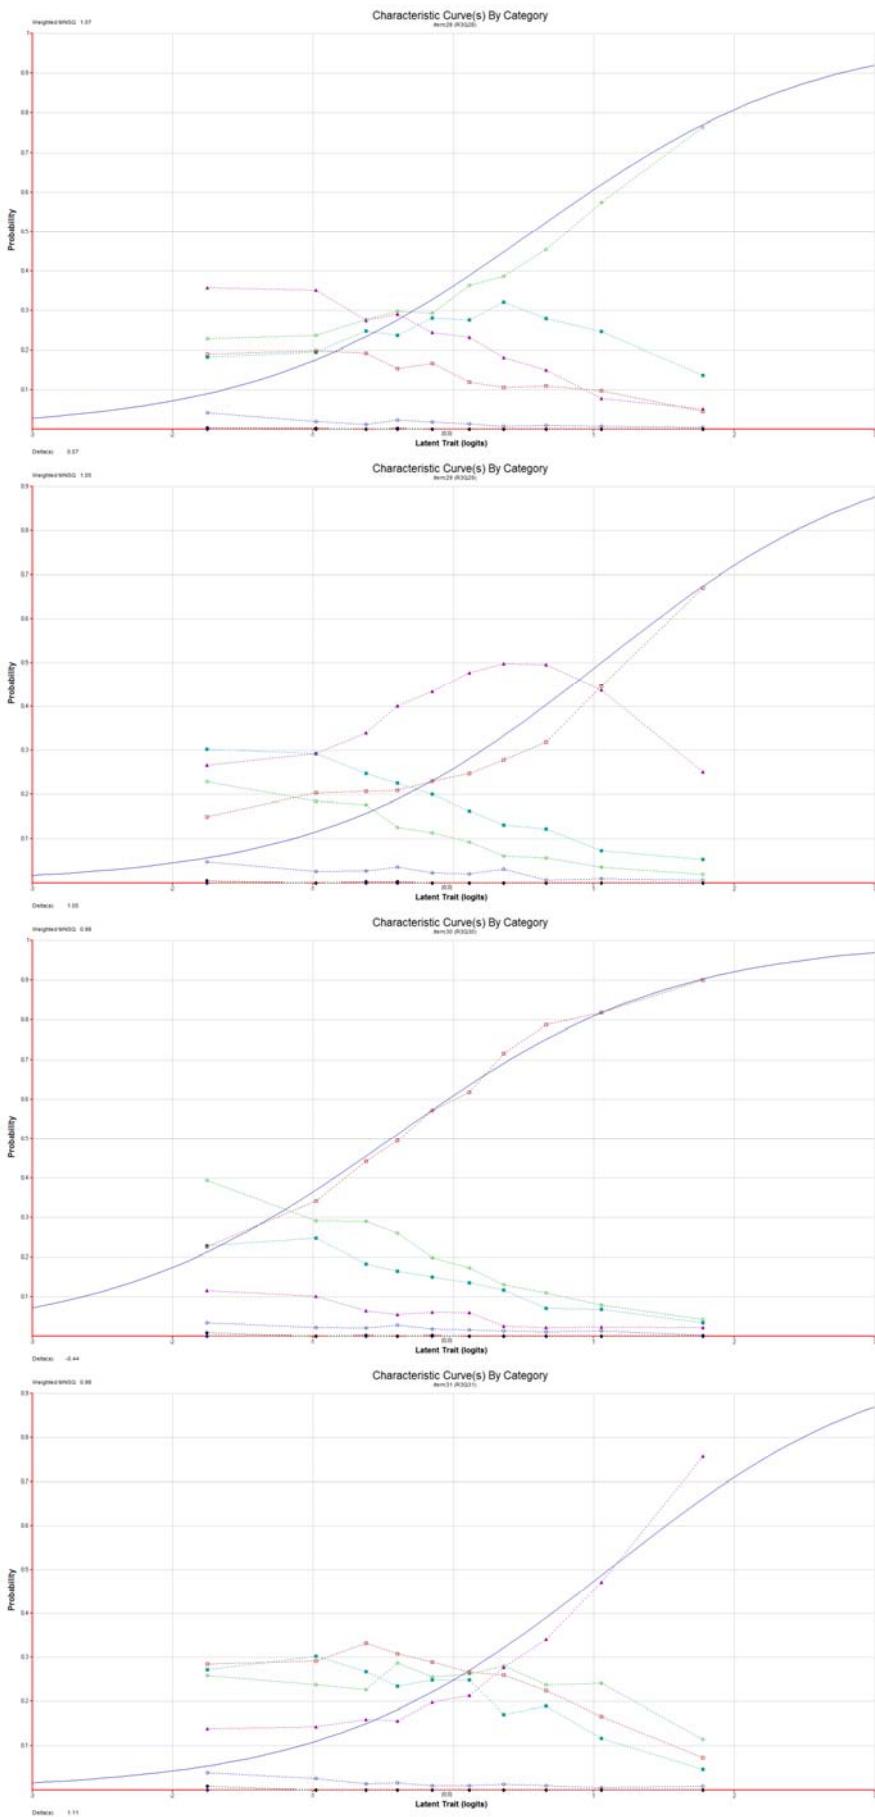

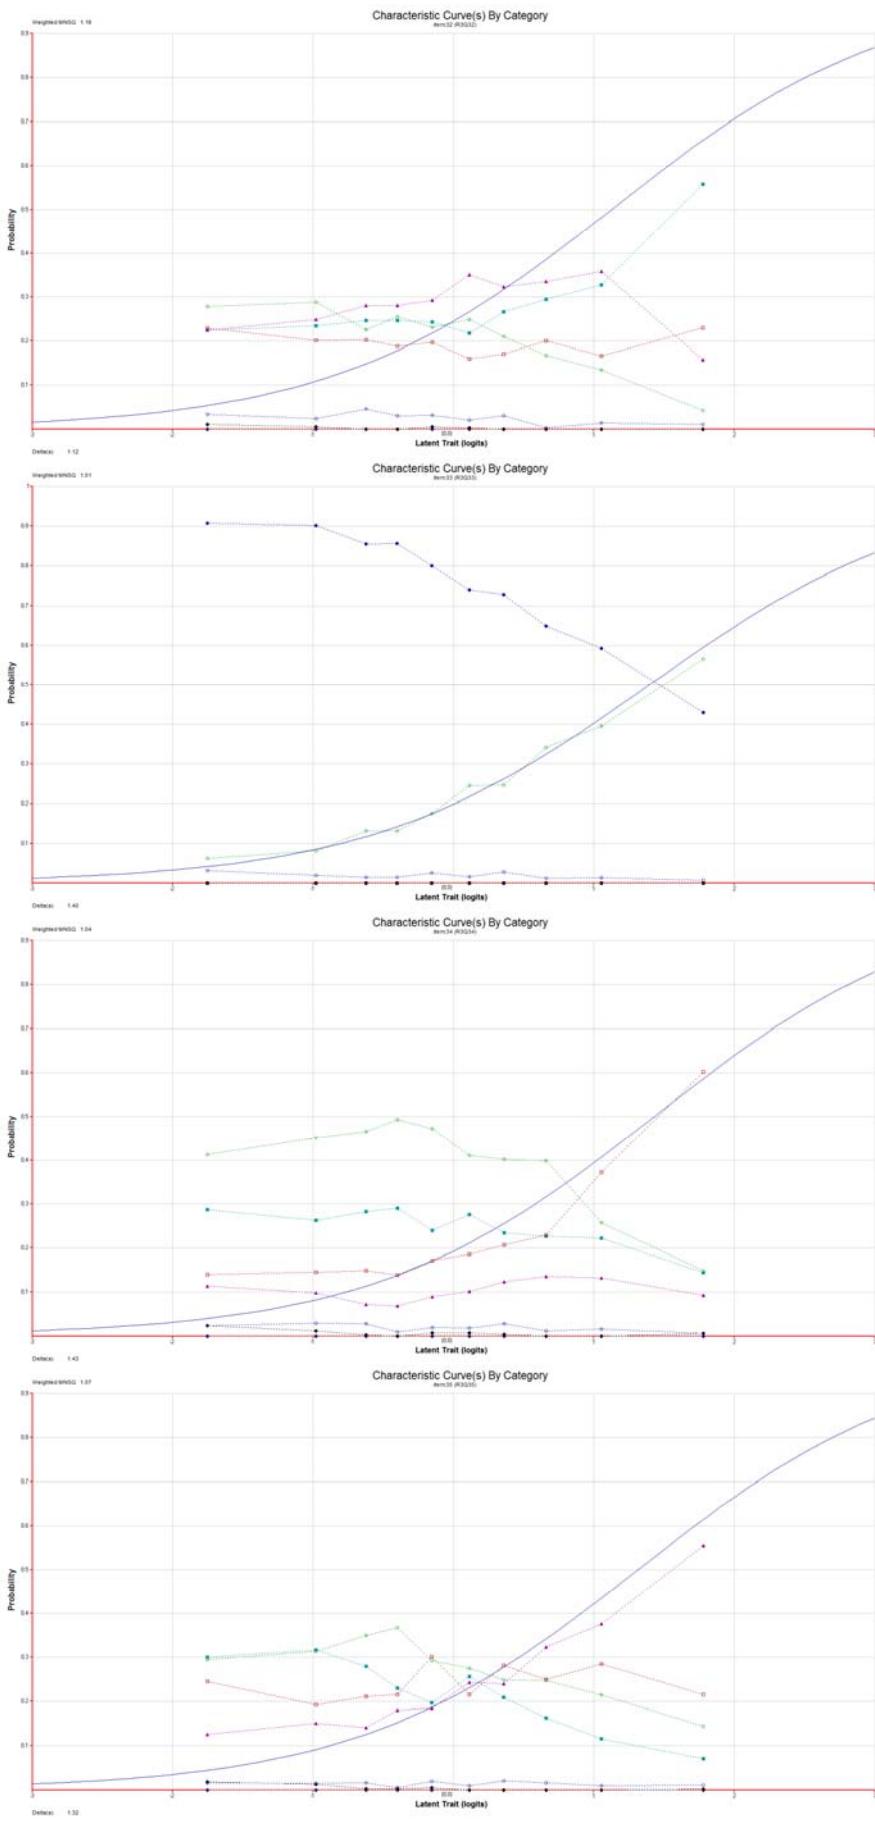

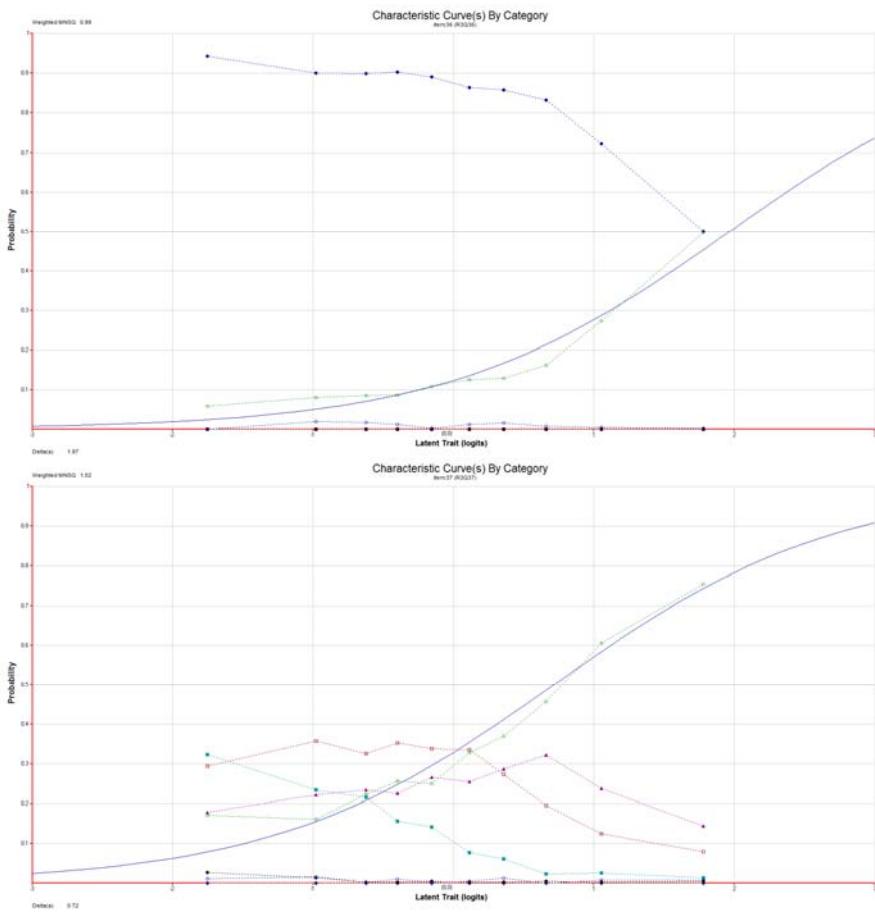

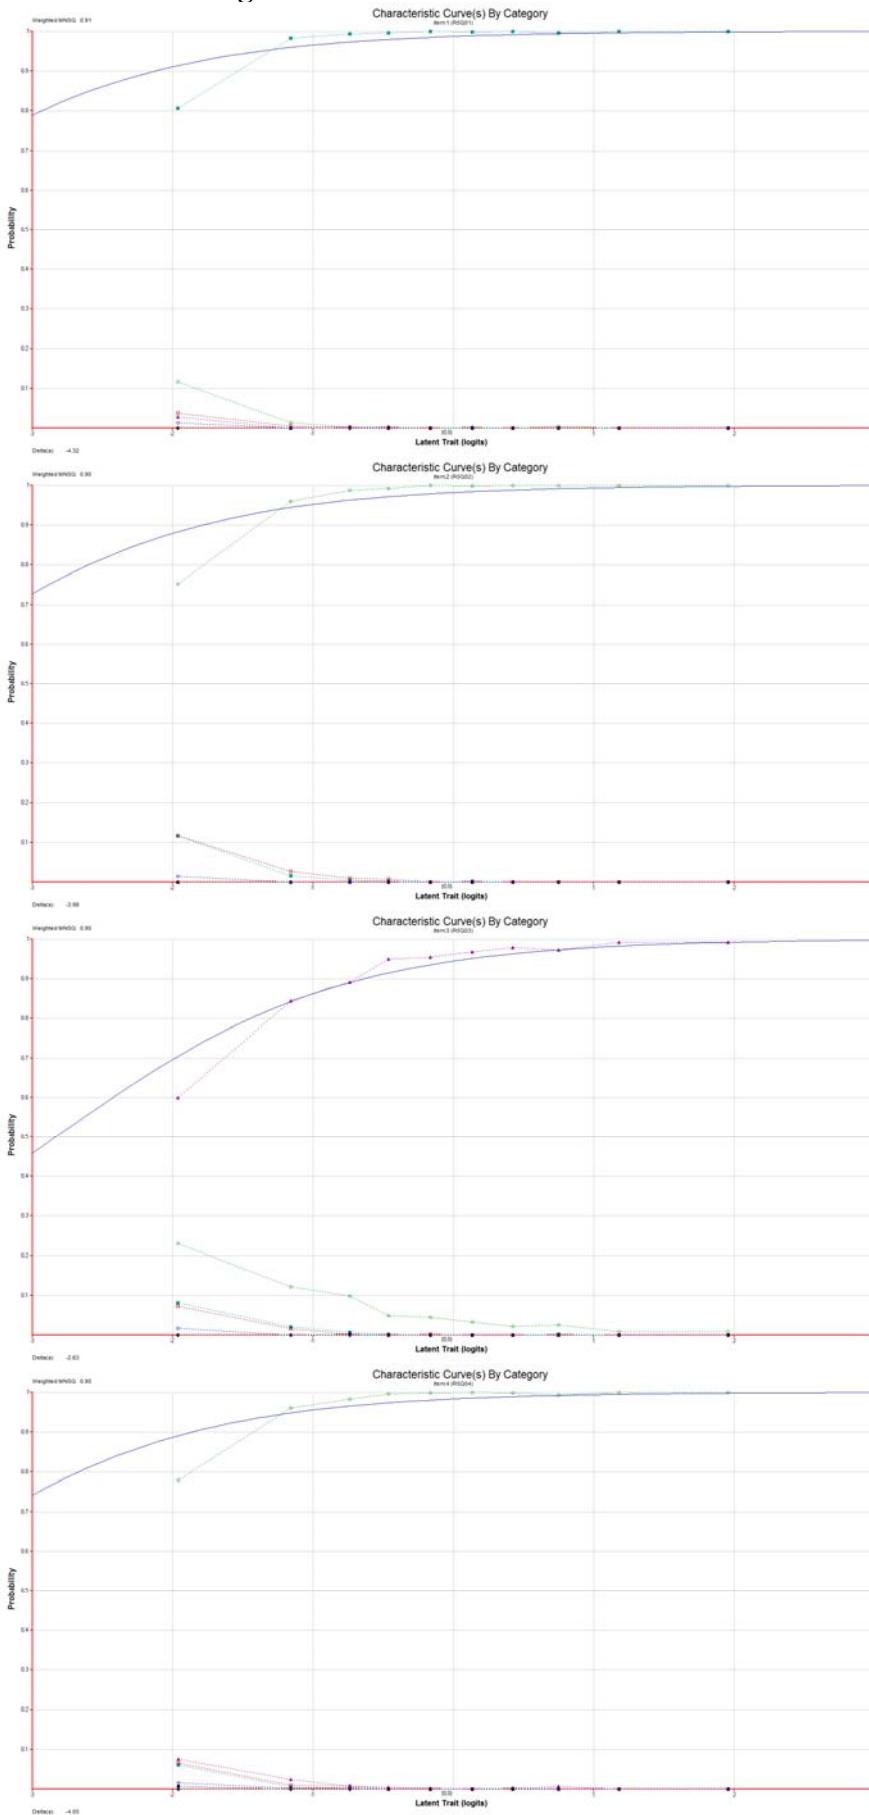

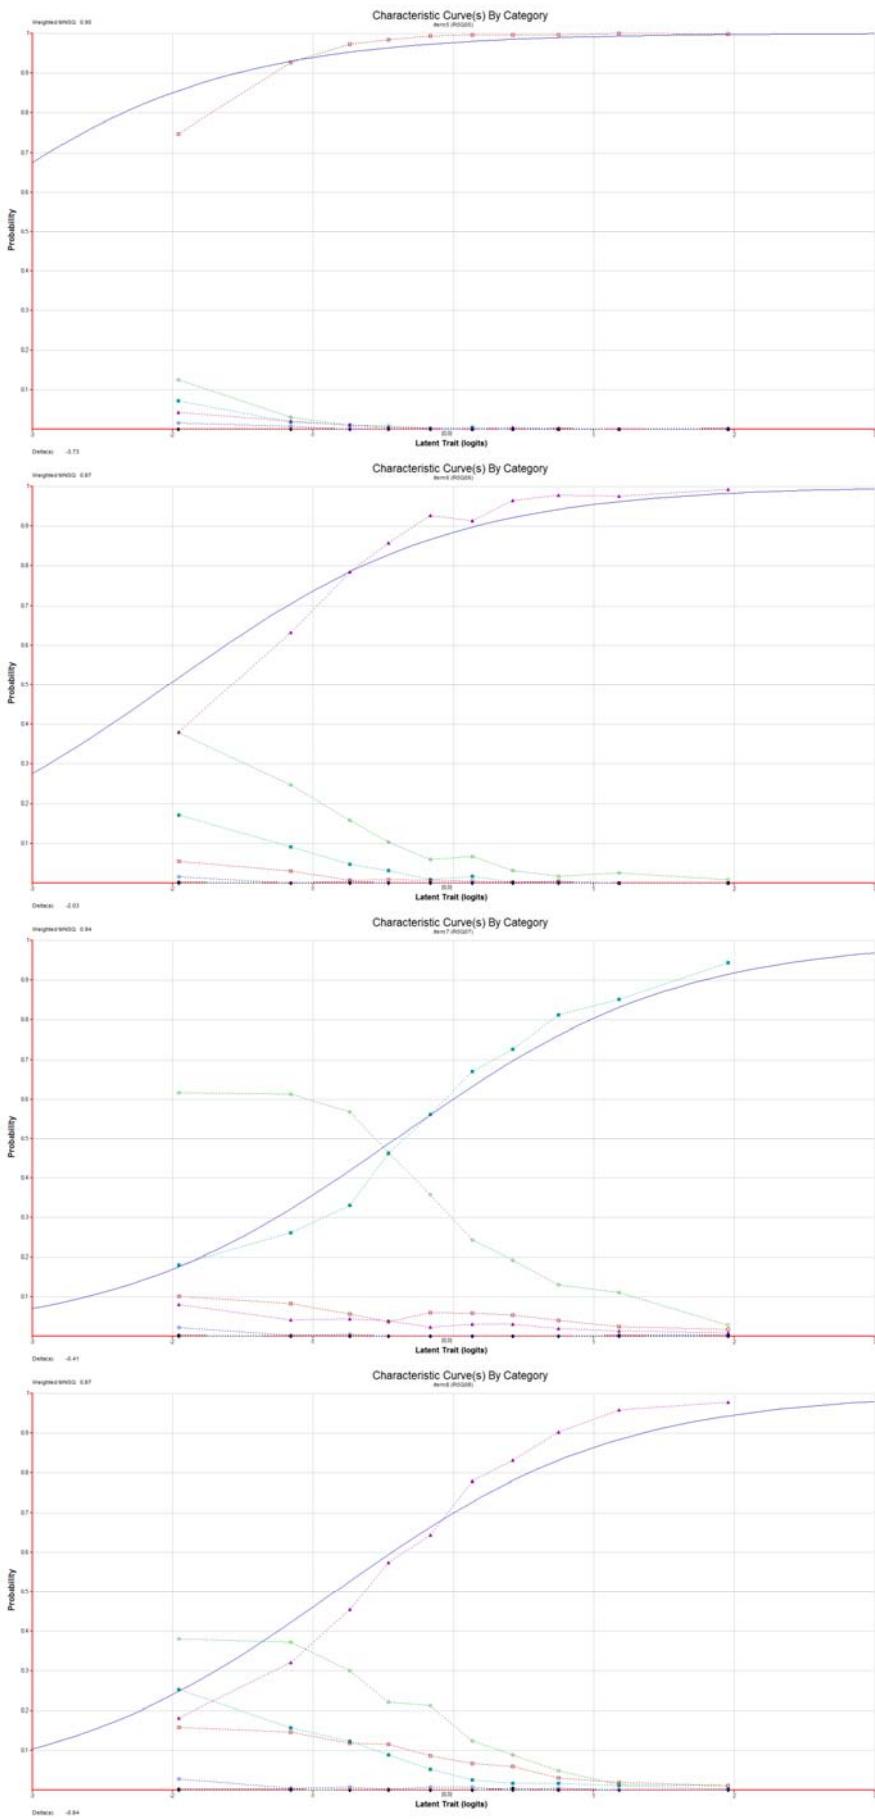

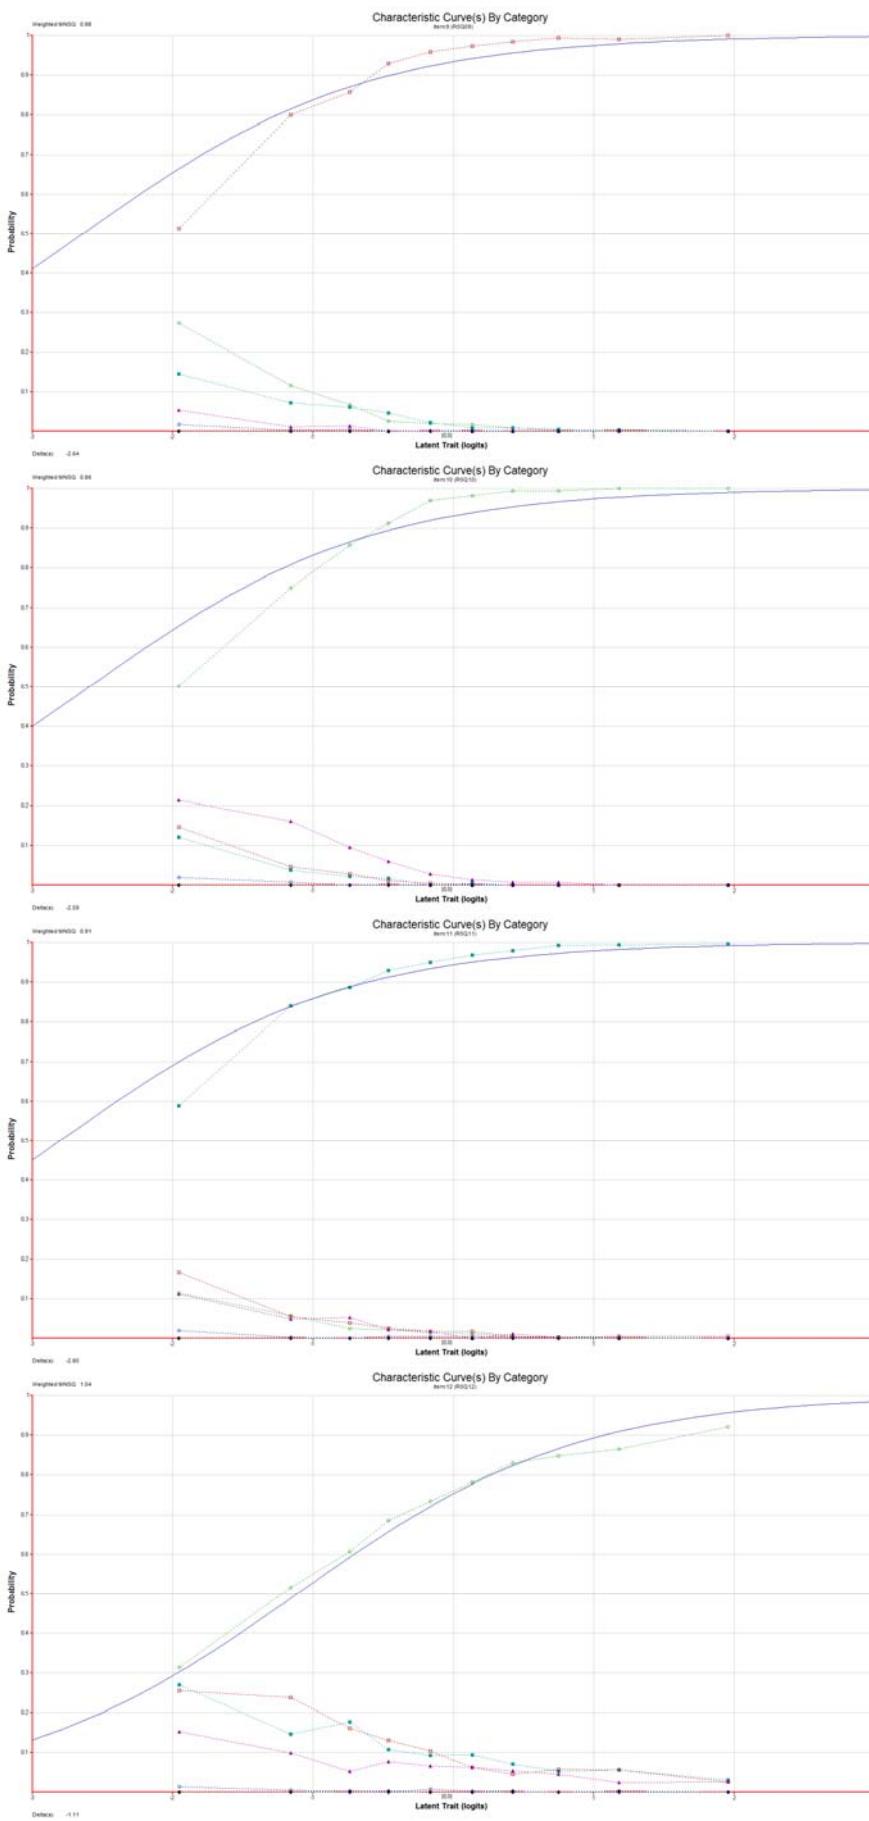

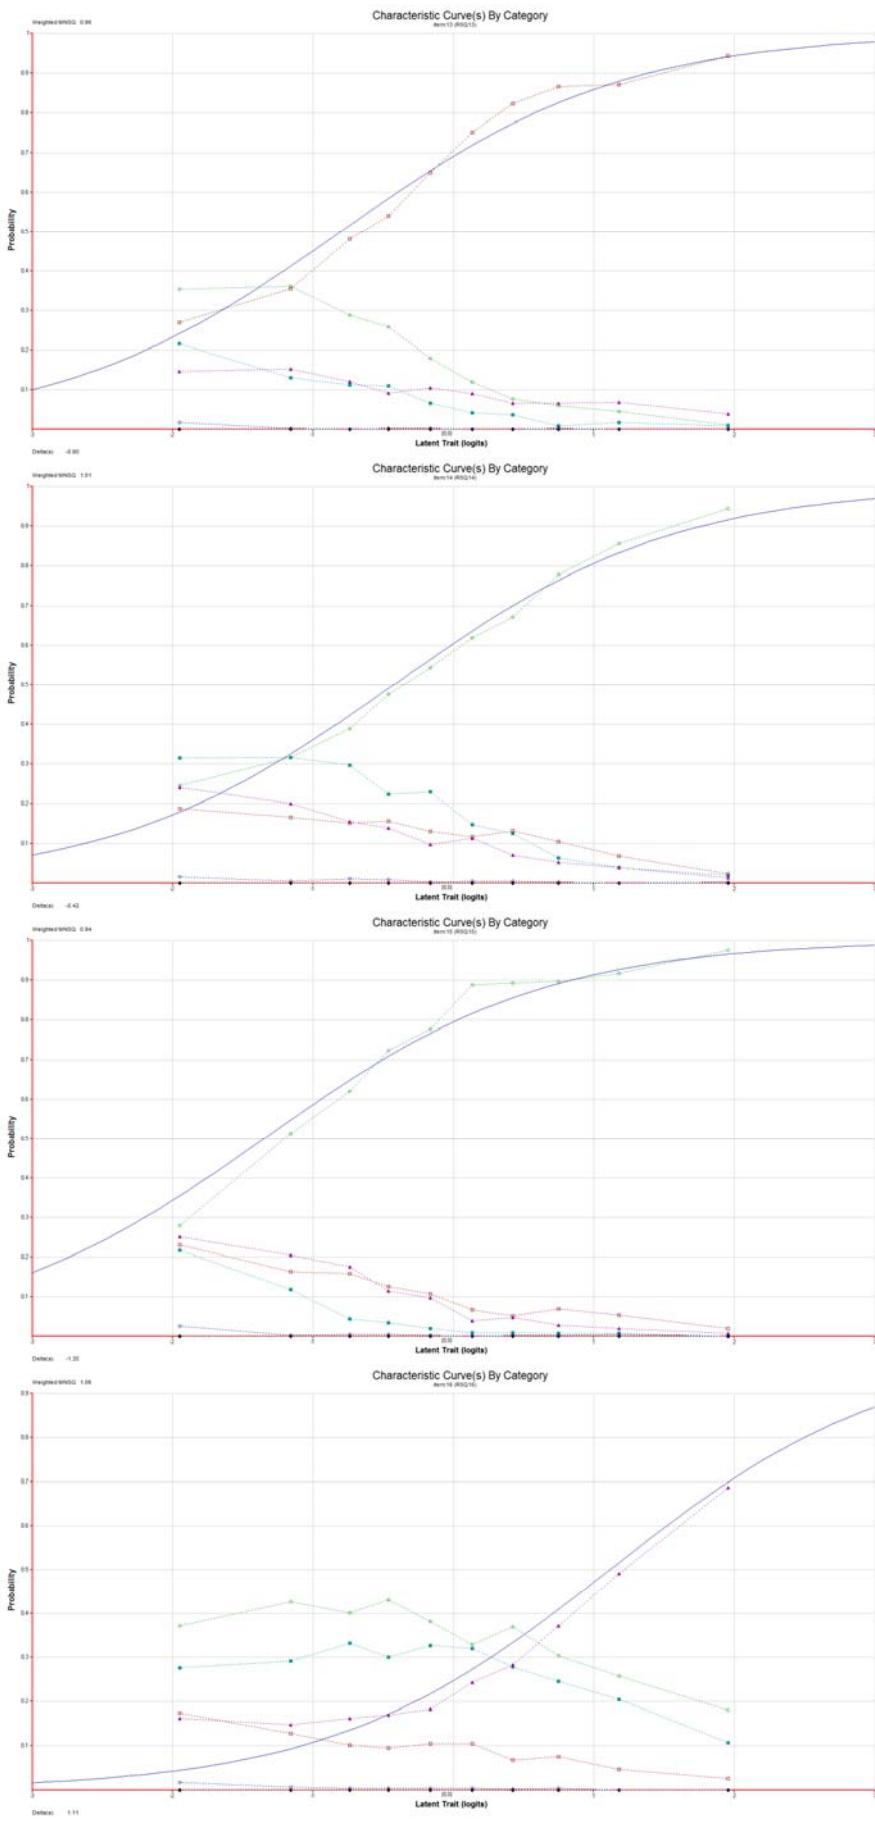

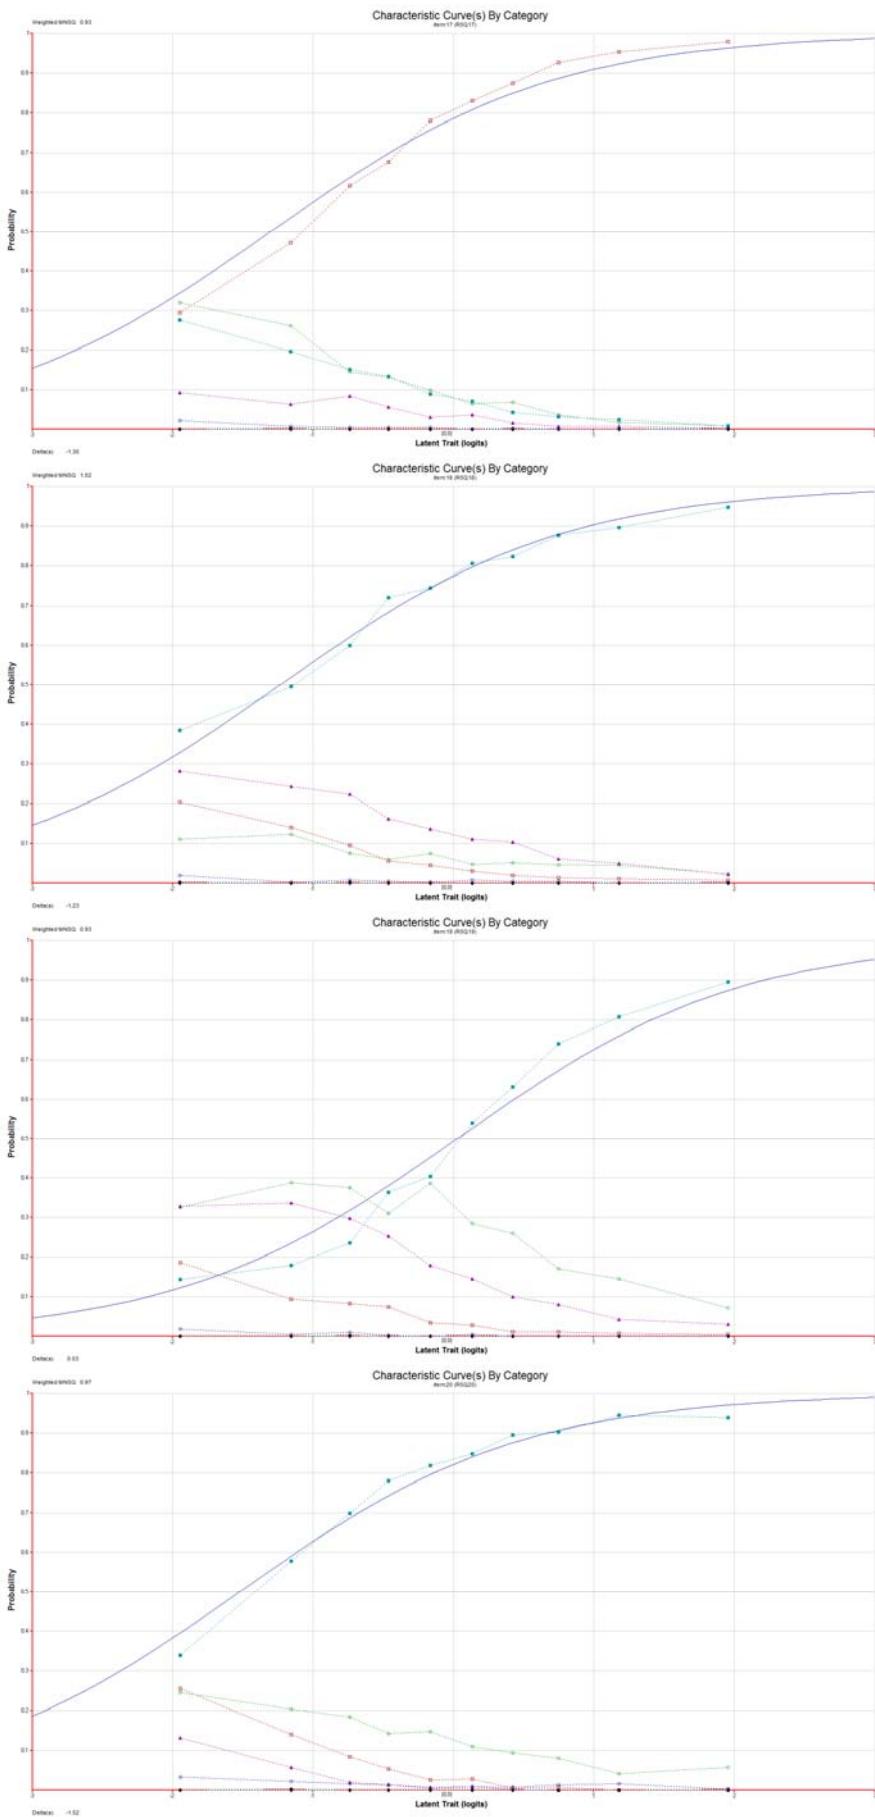

## D.2. Year 5 Reading

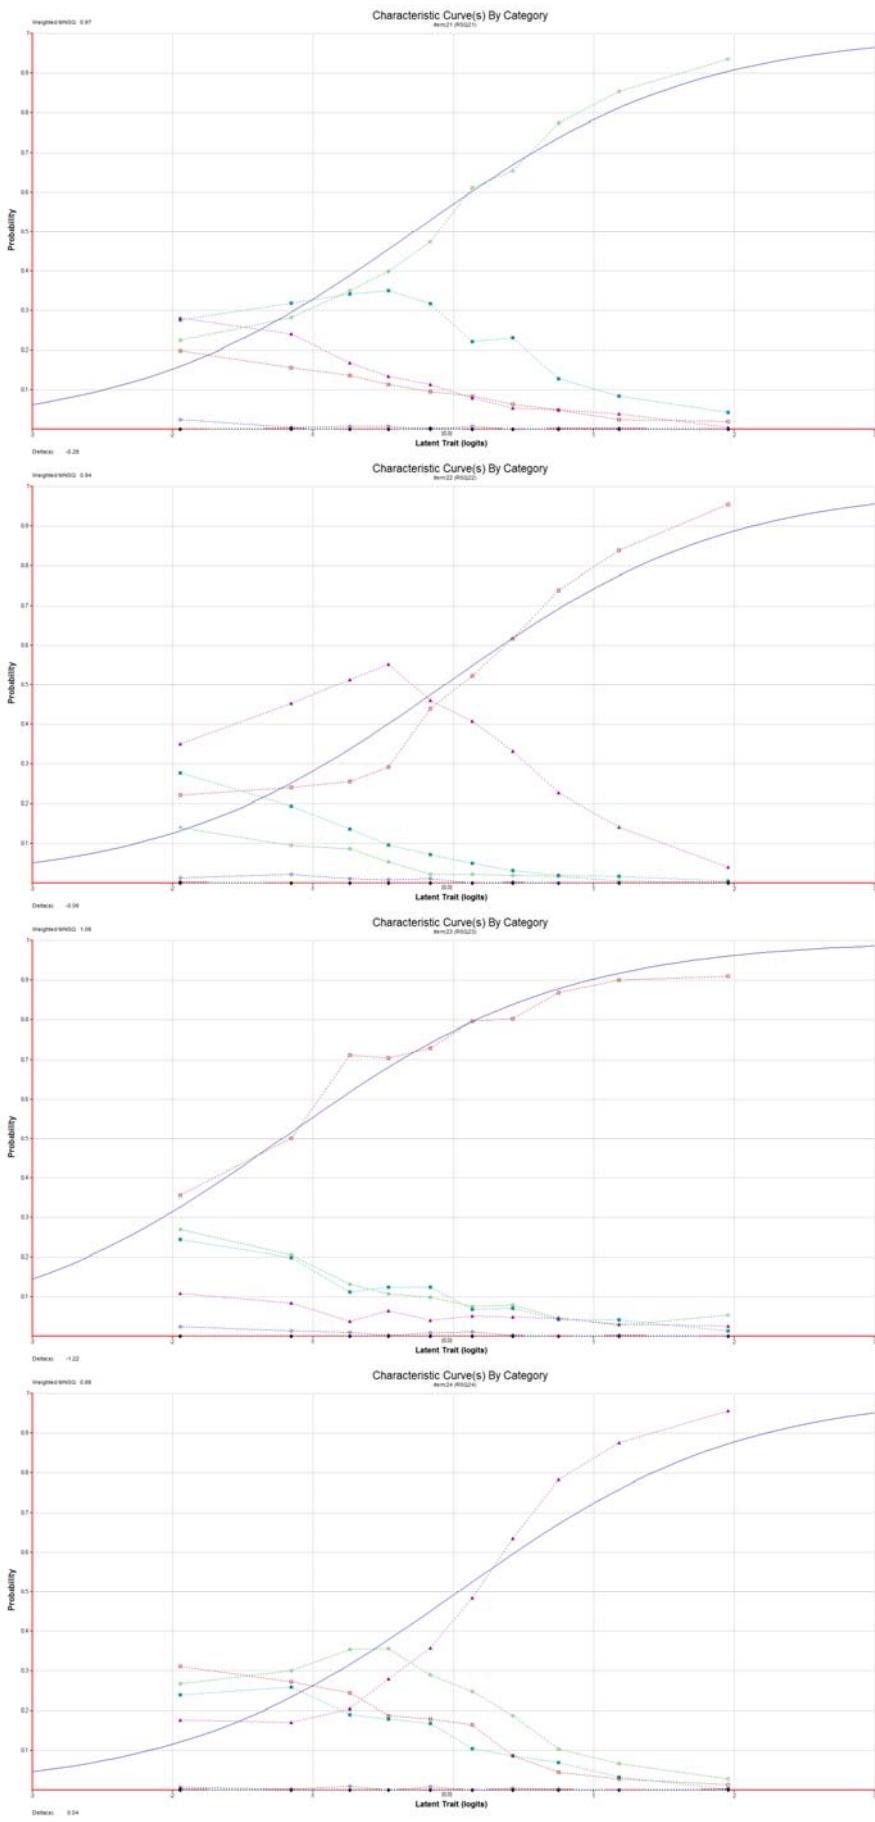

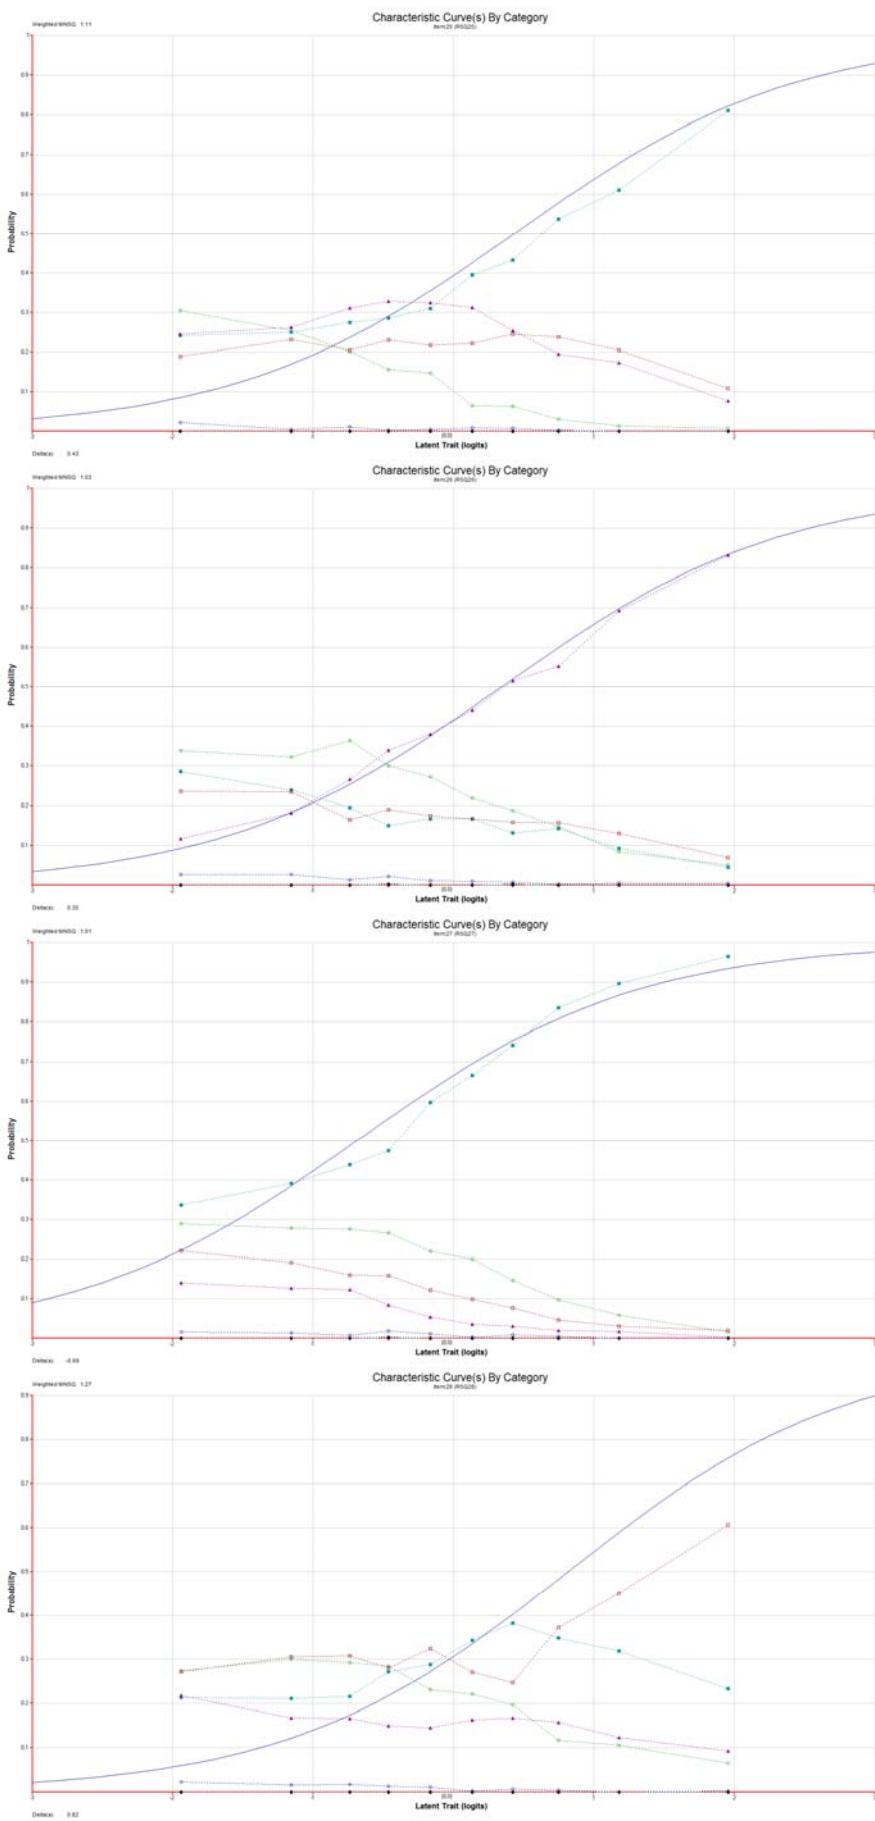

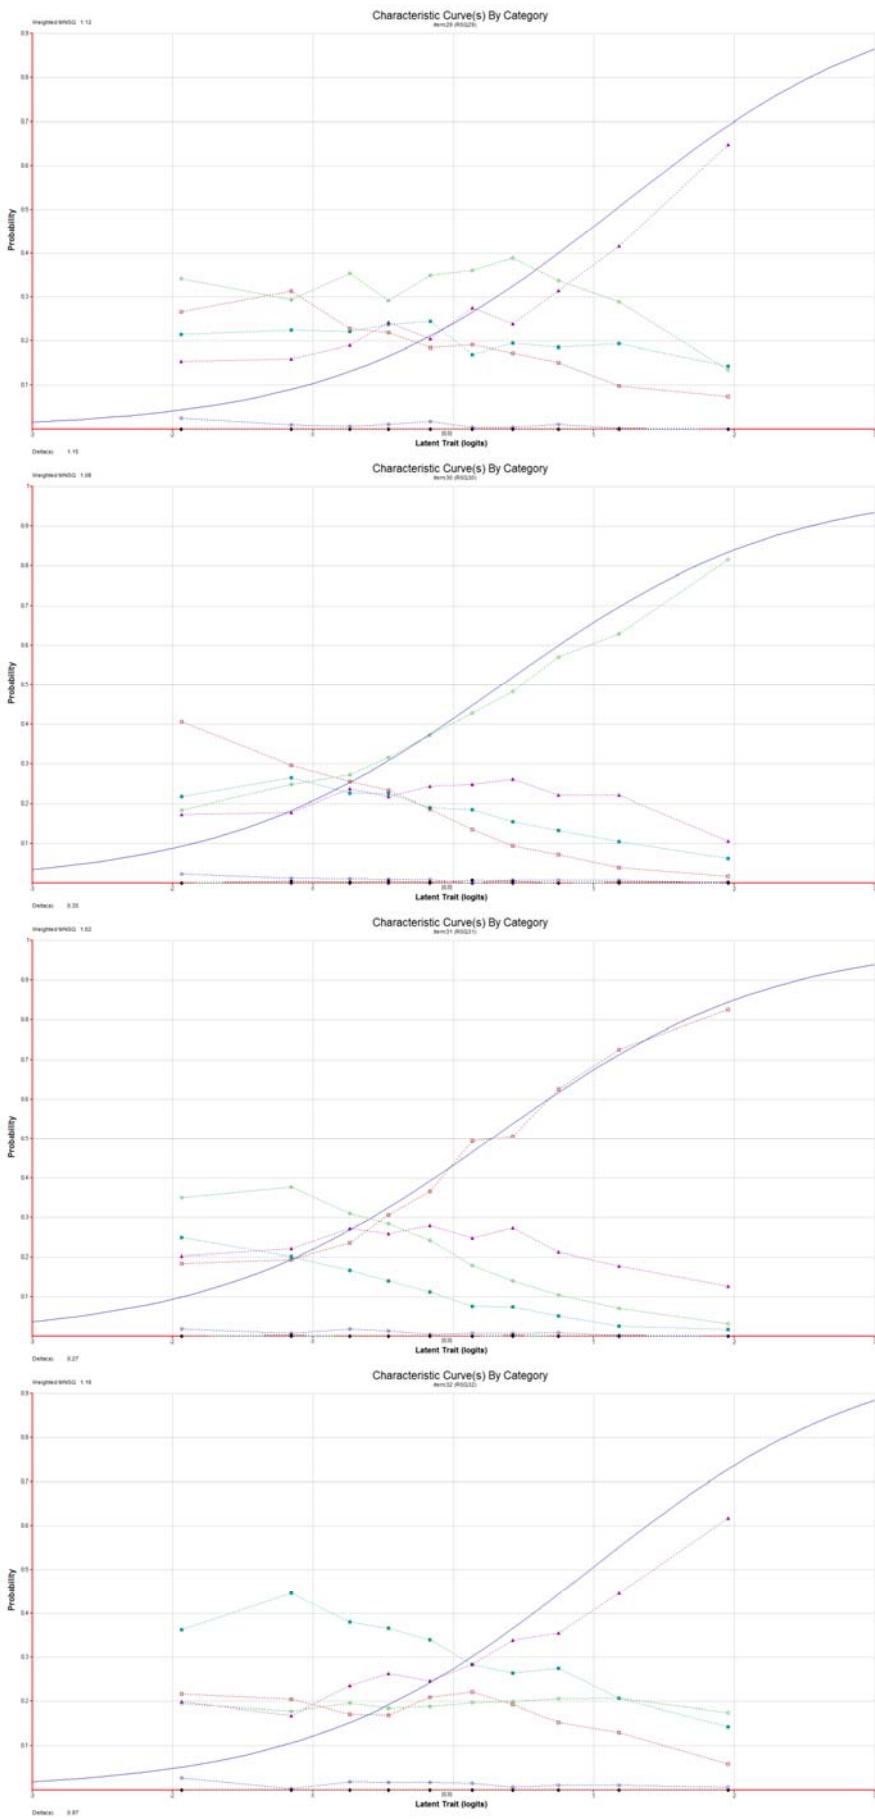

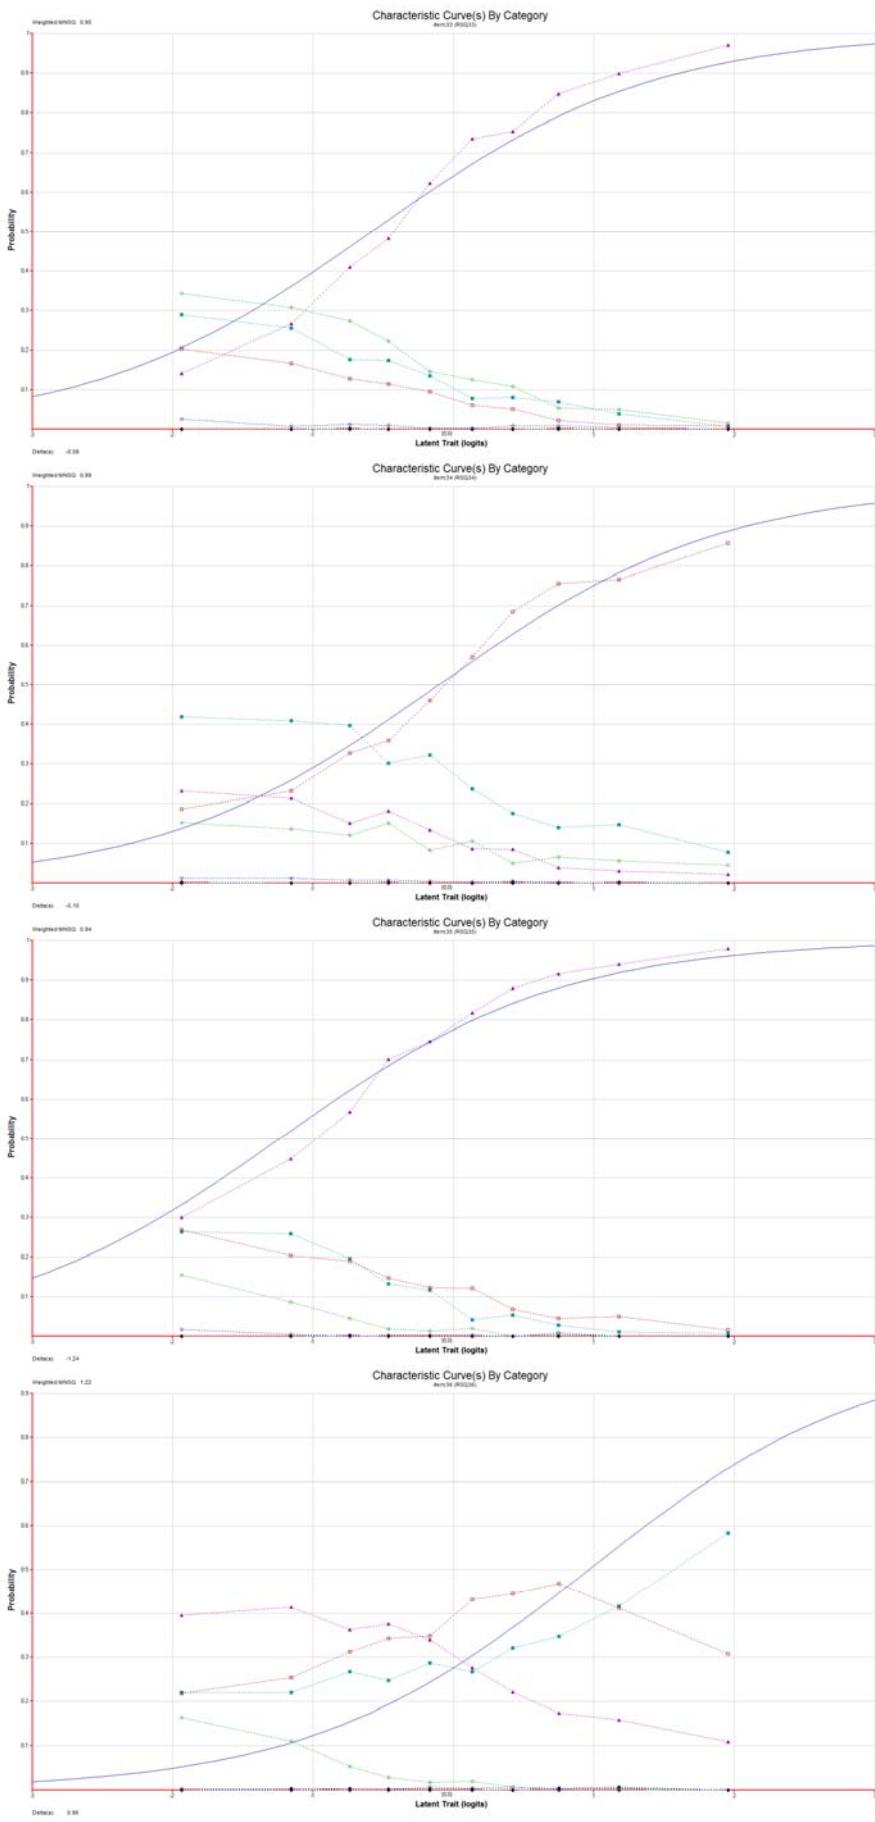

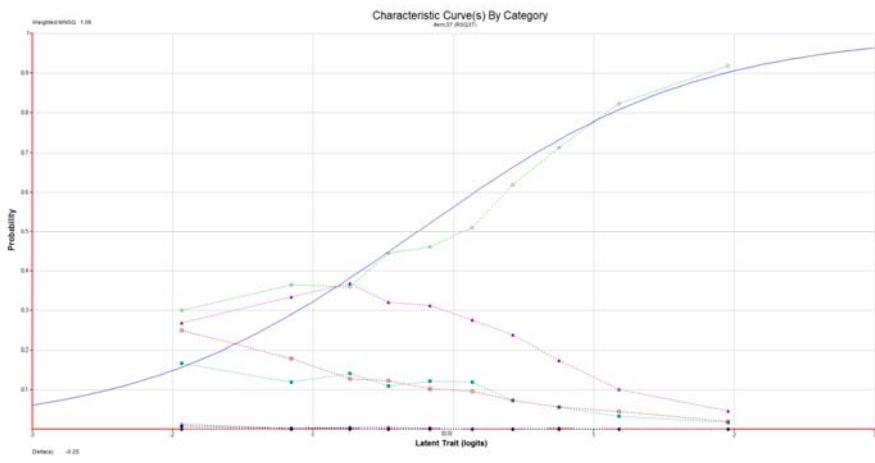

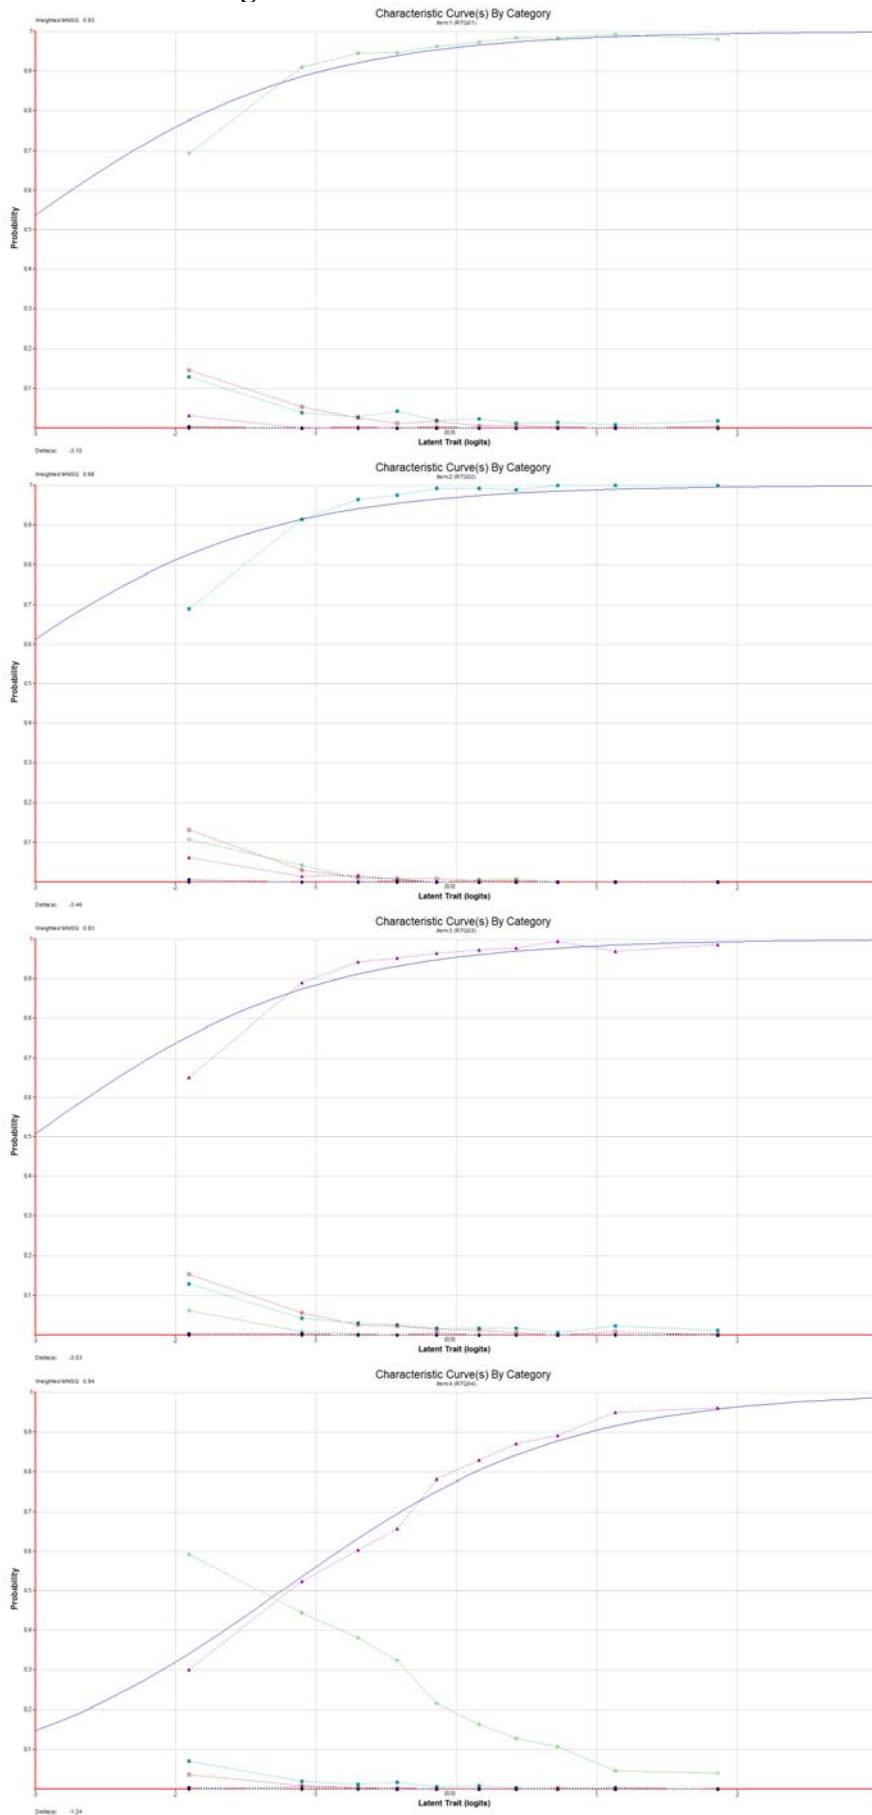

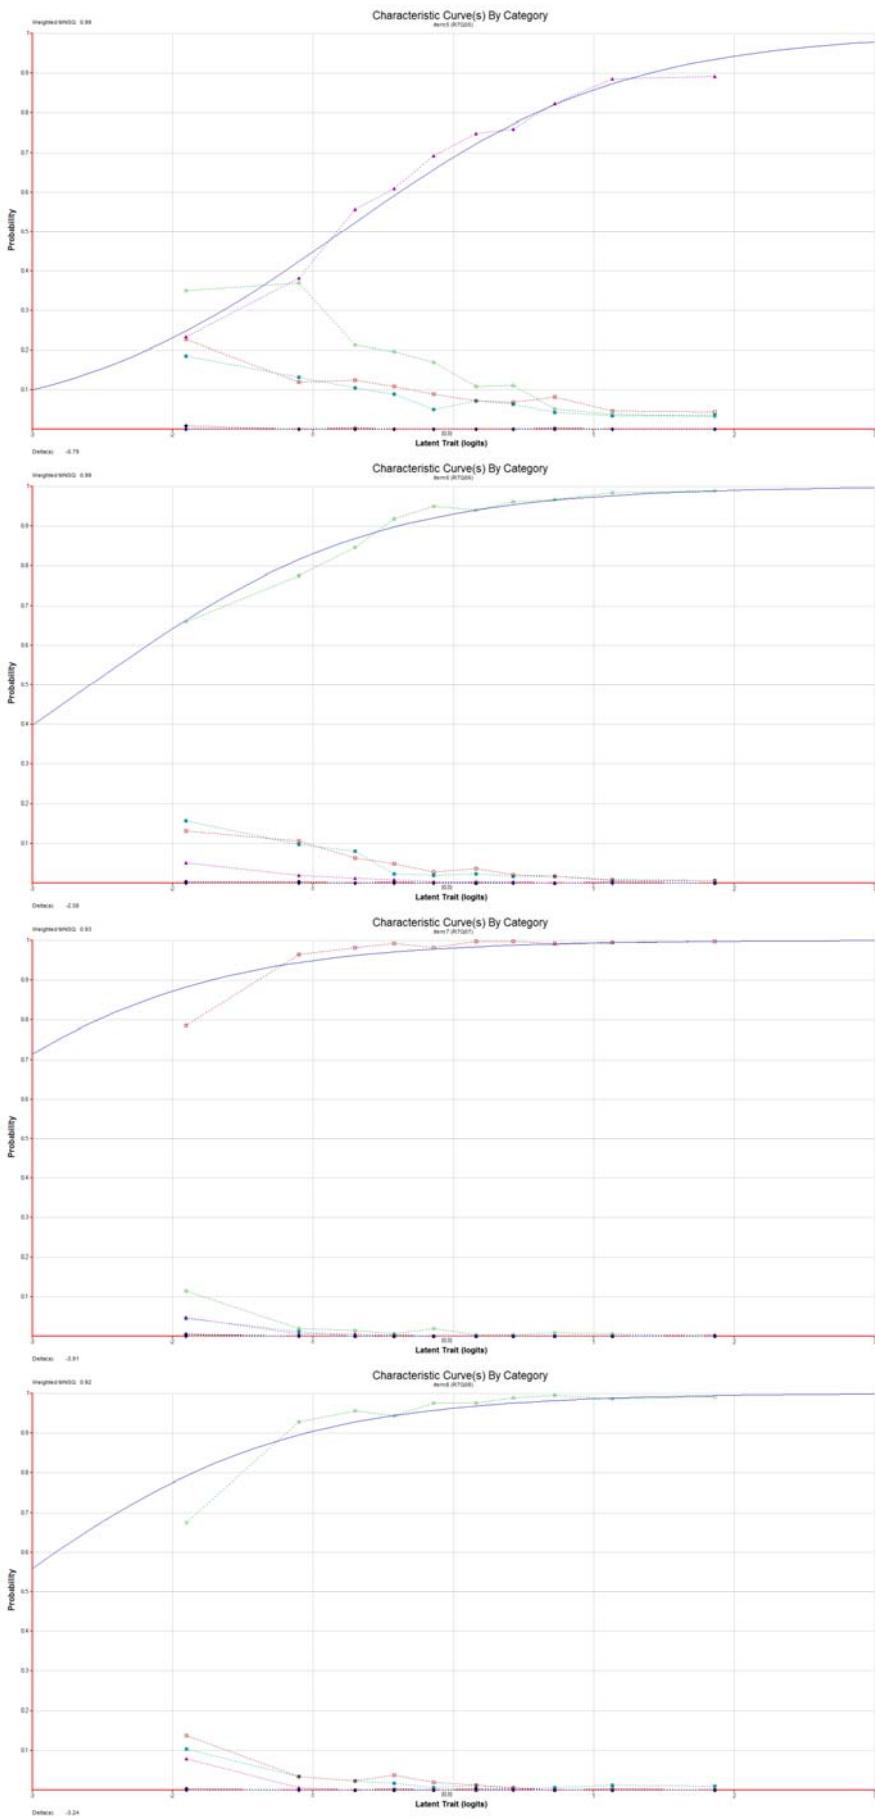

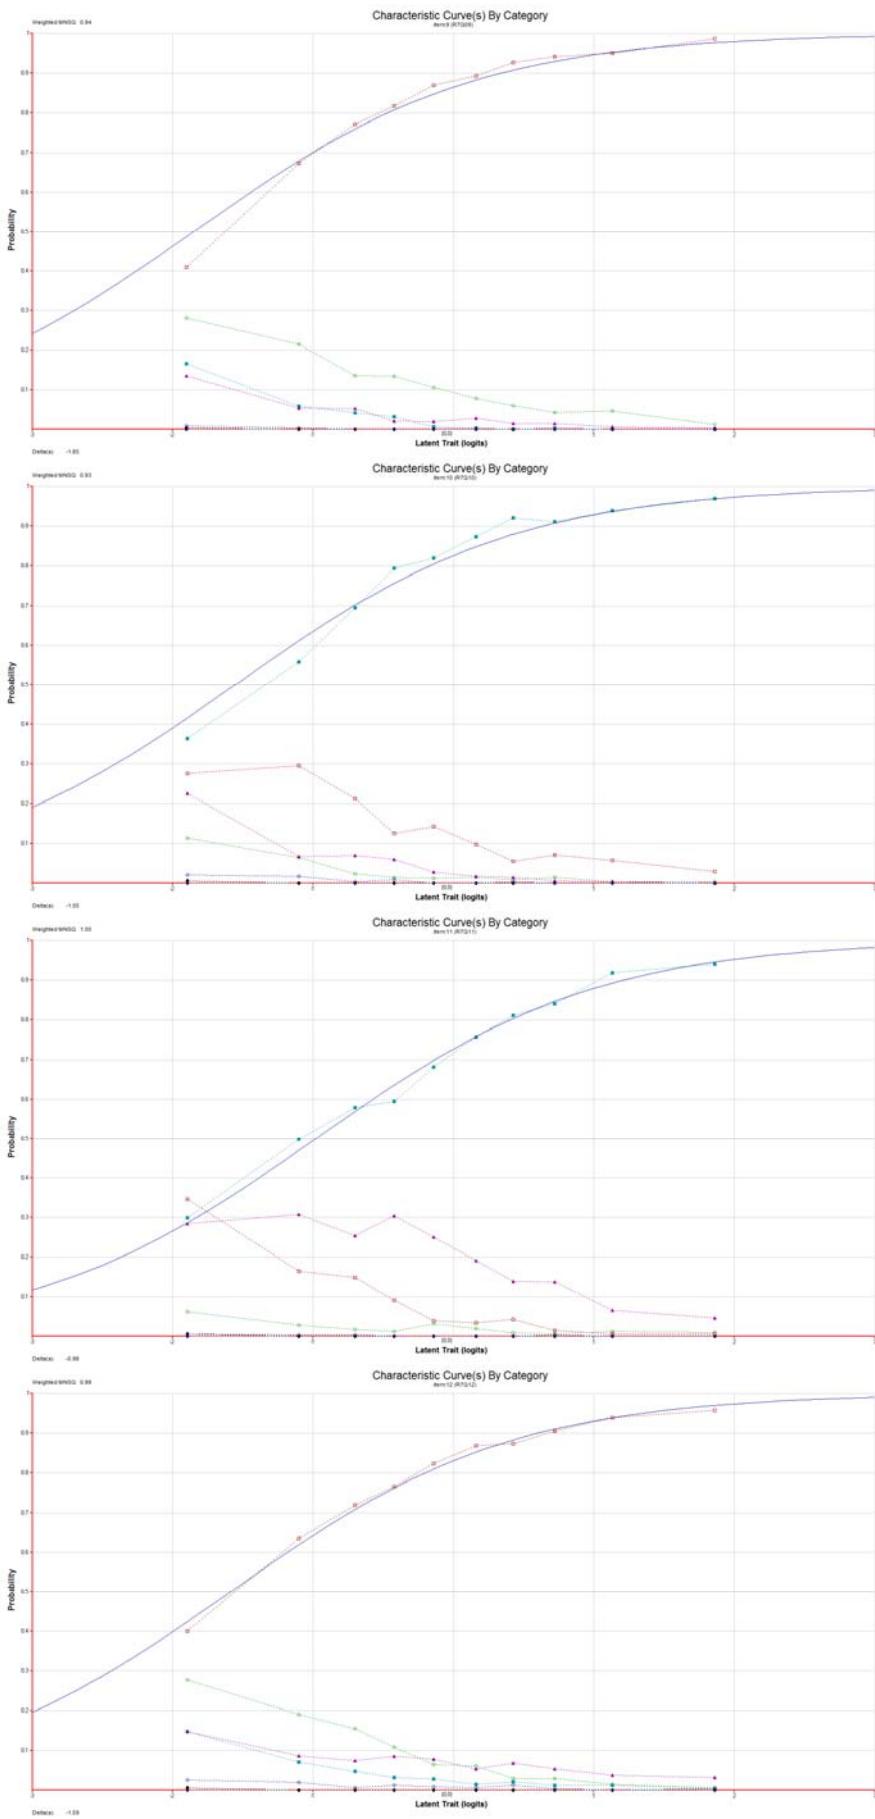

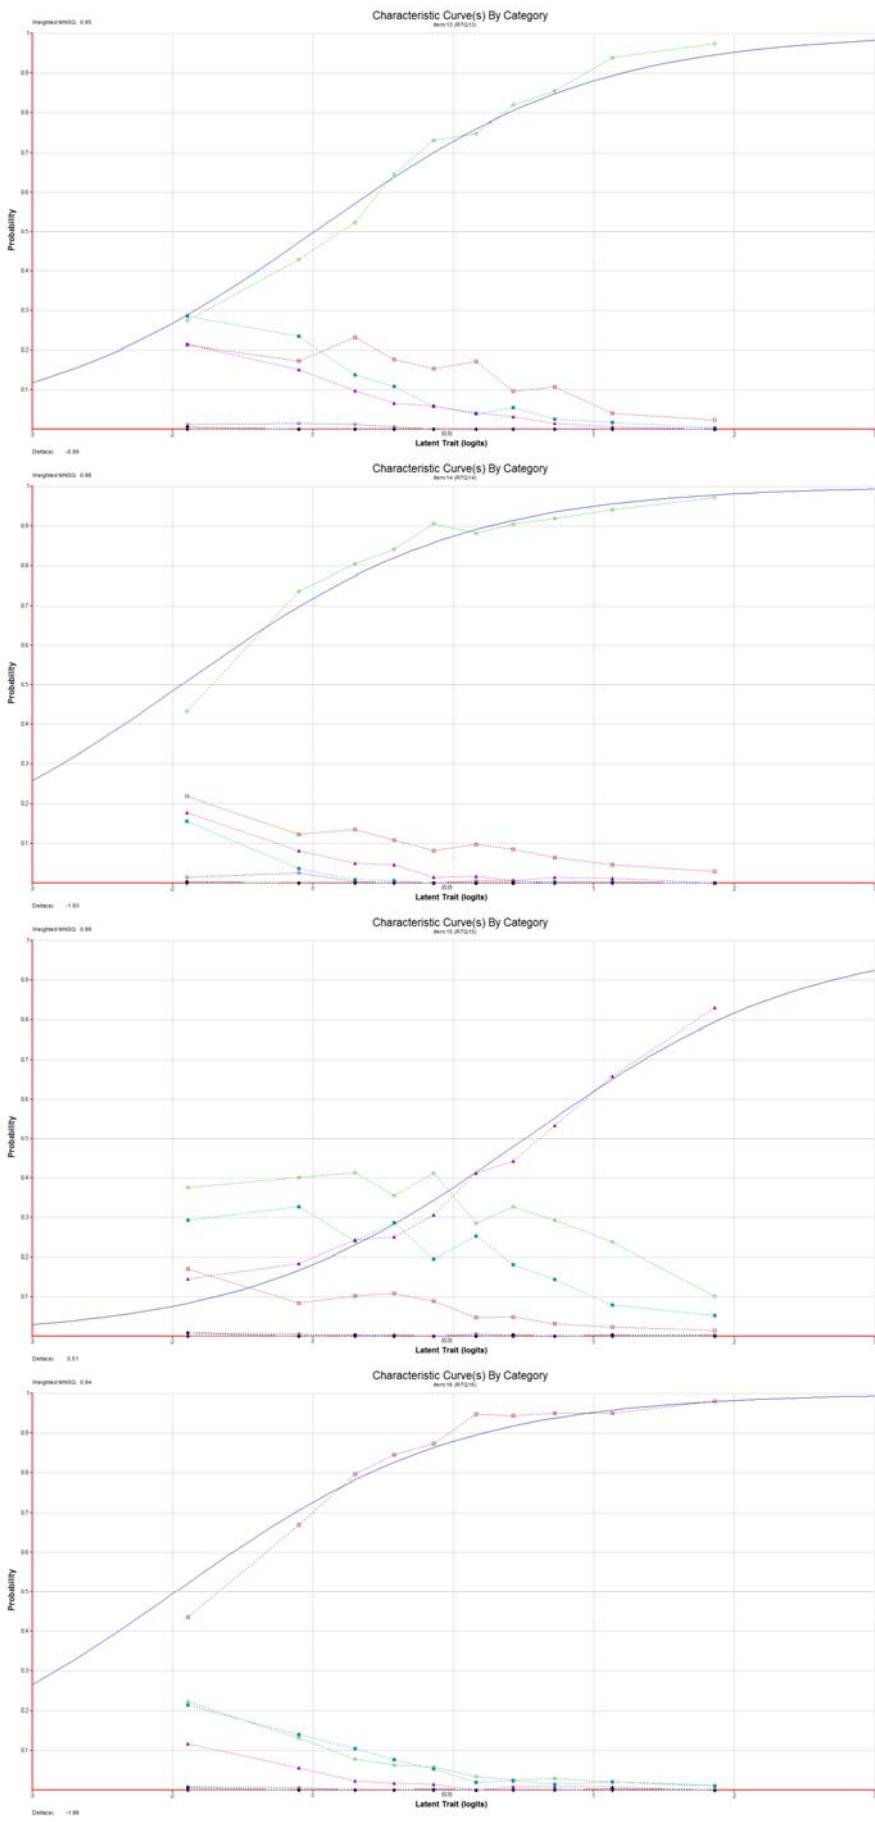

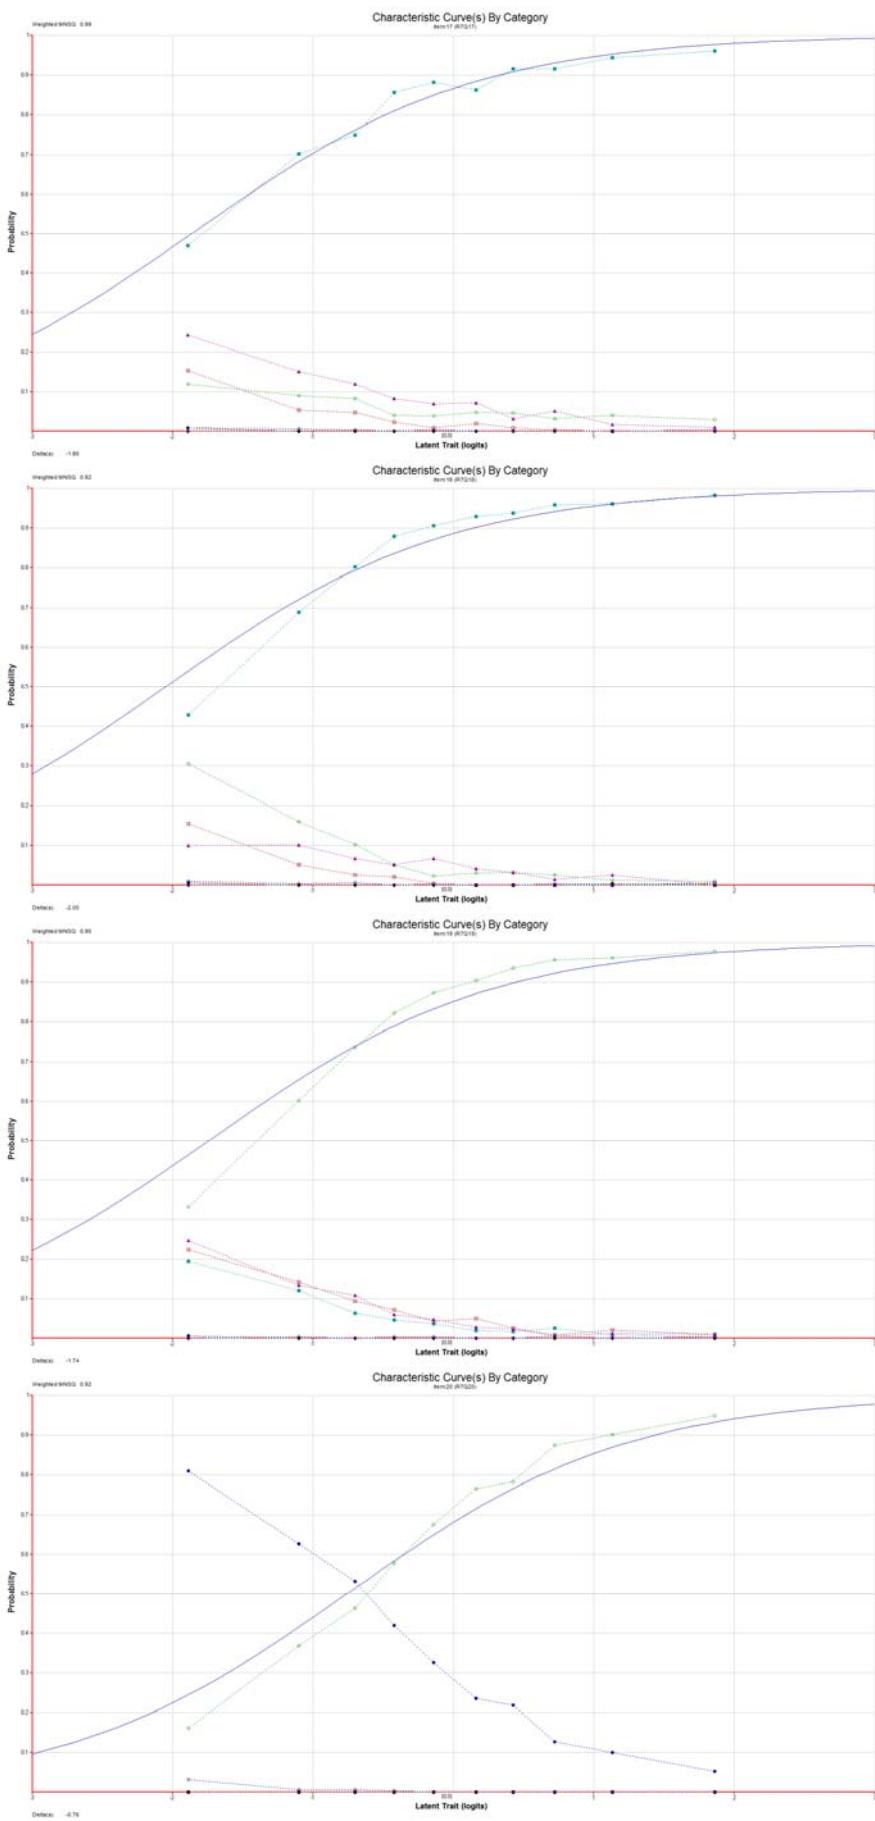

### D.3. Year 7 Reading

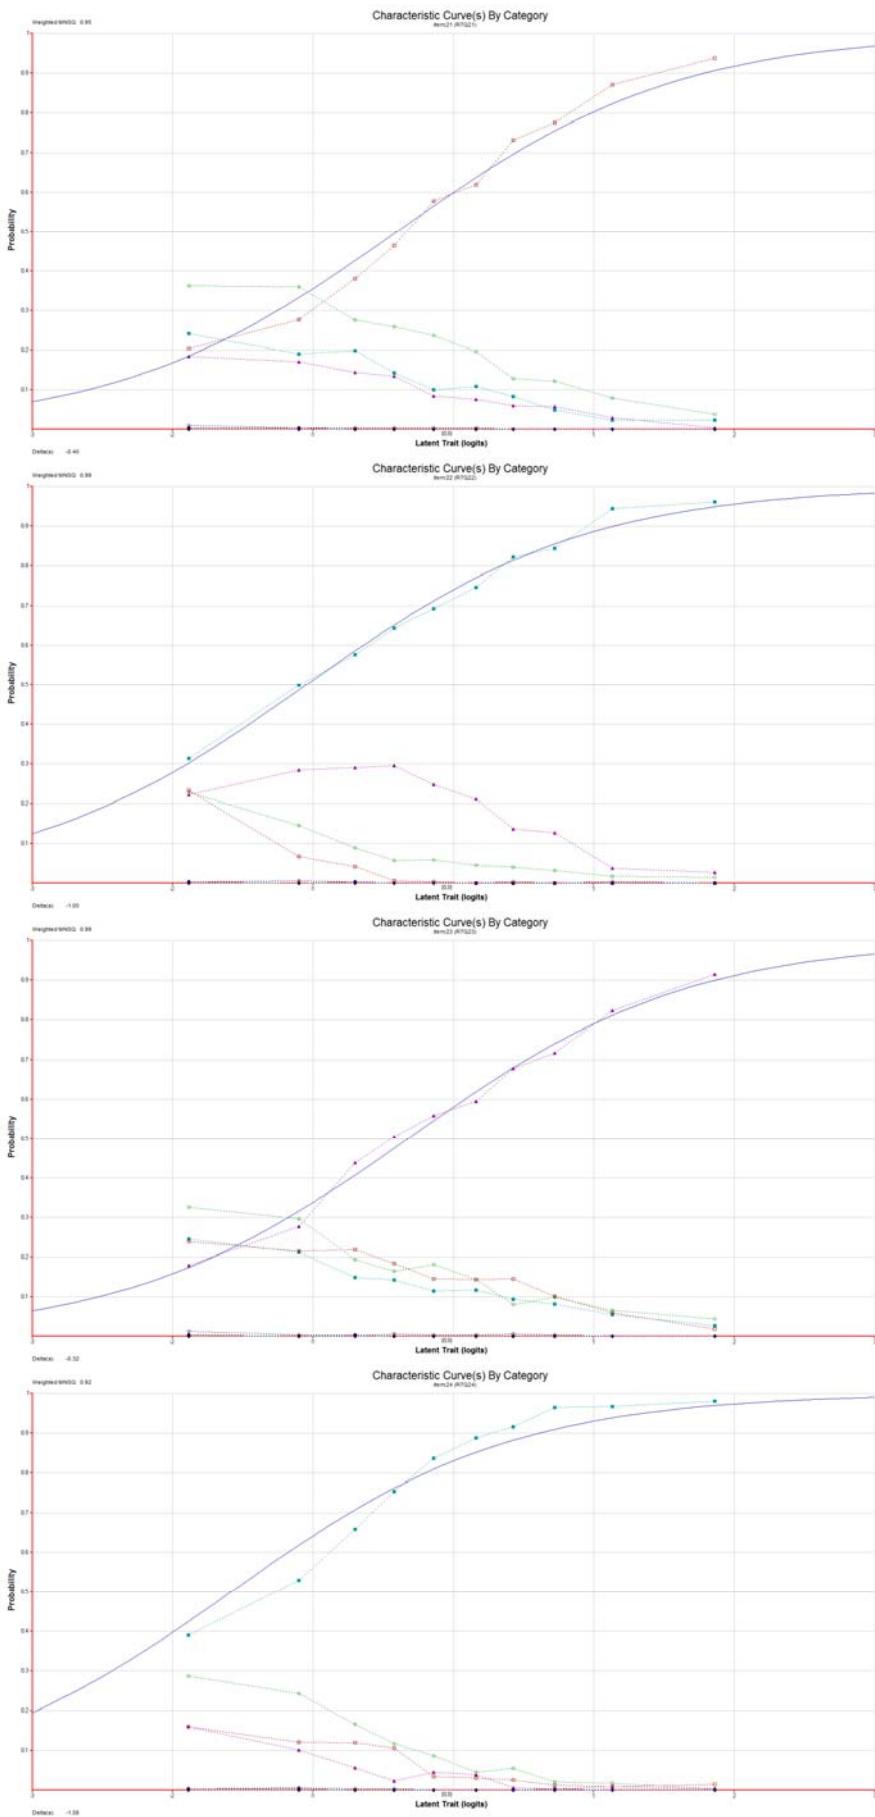

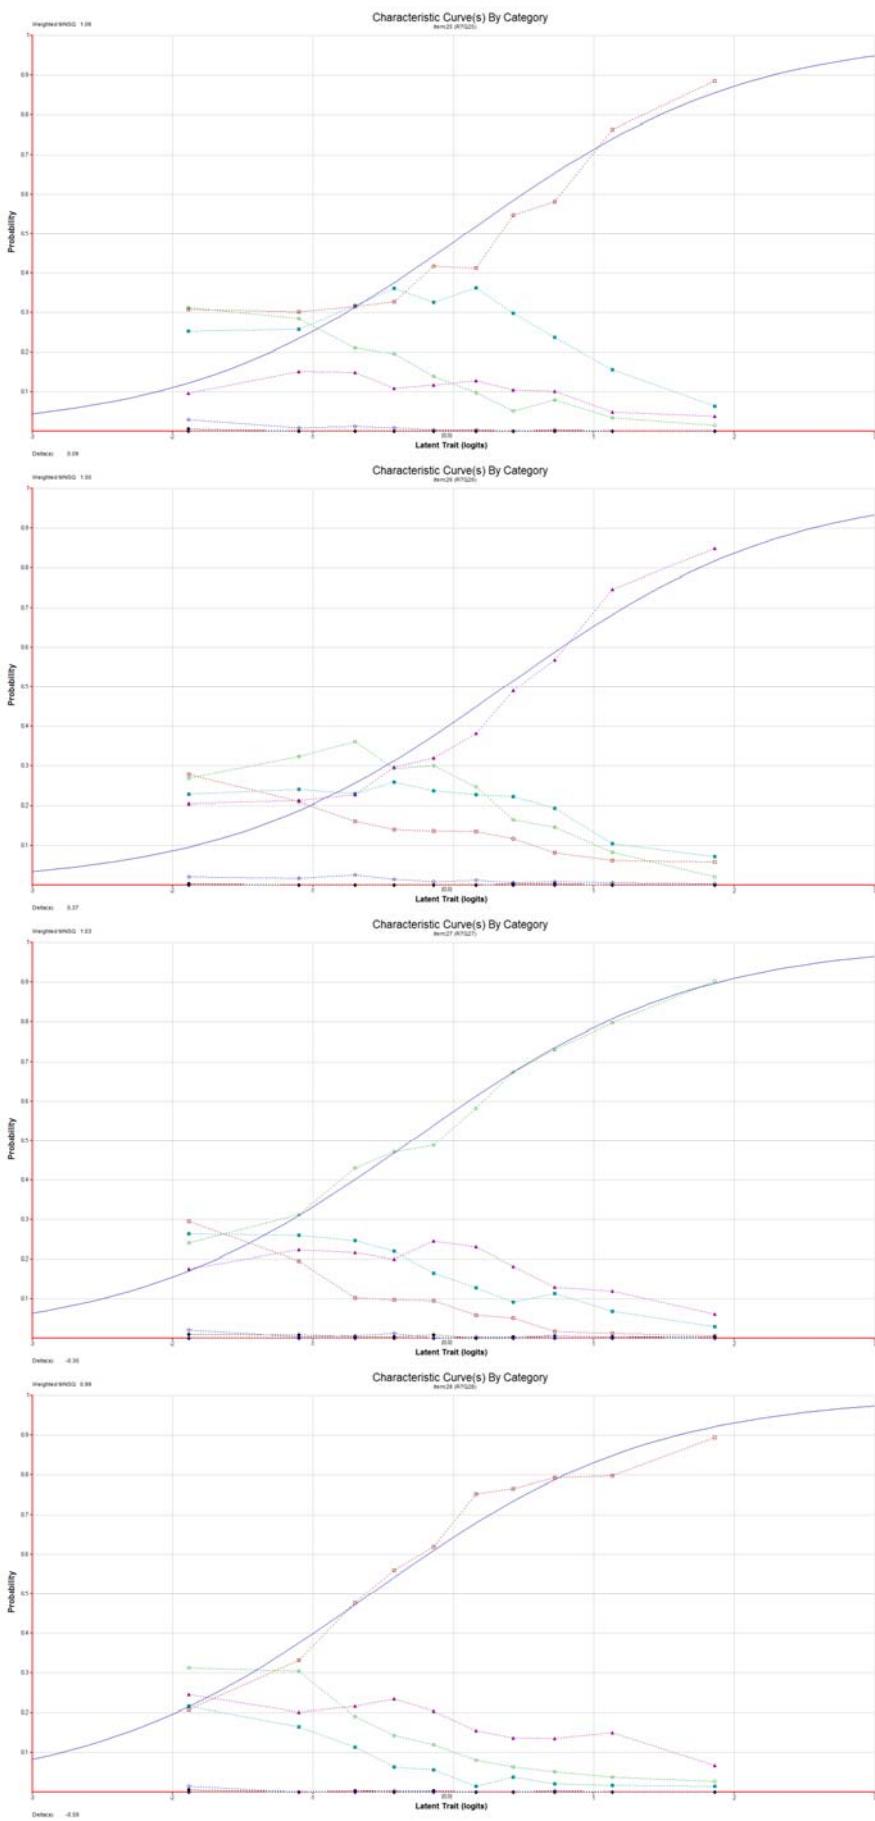

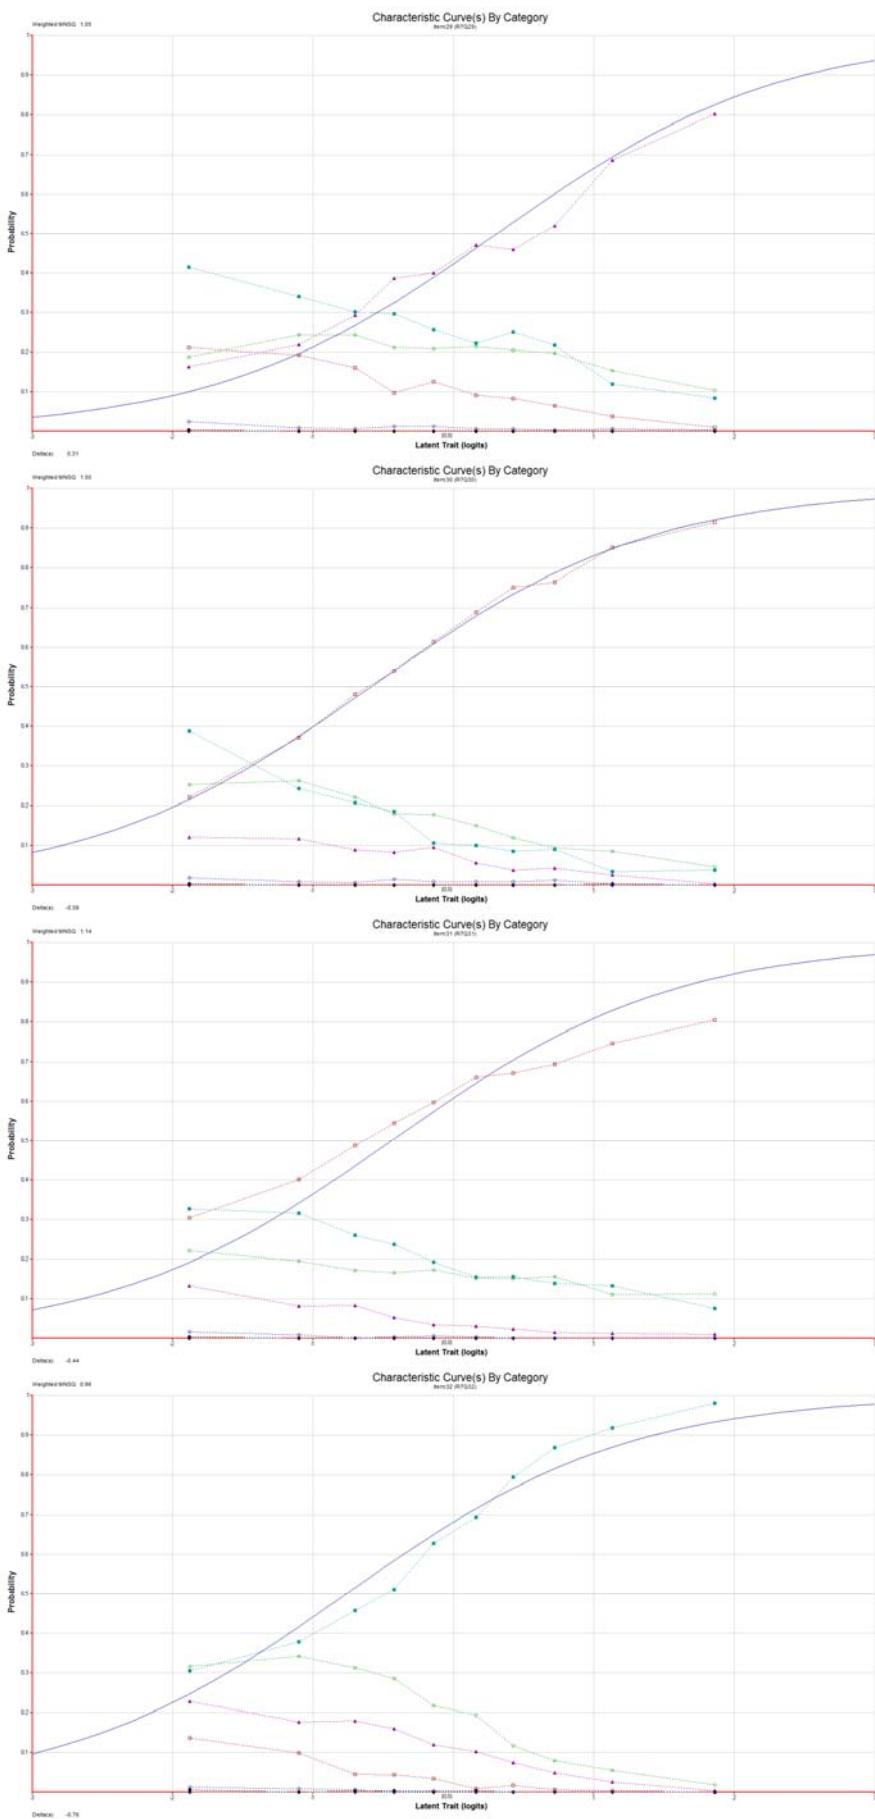

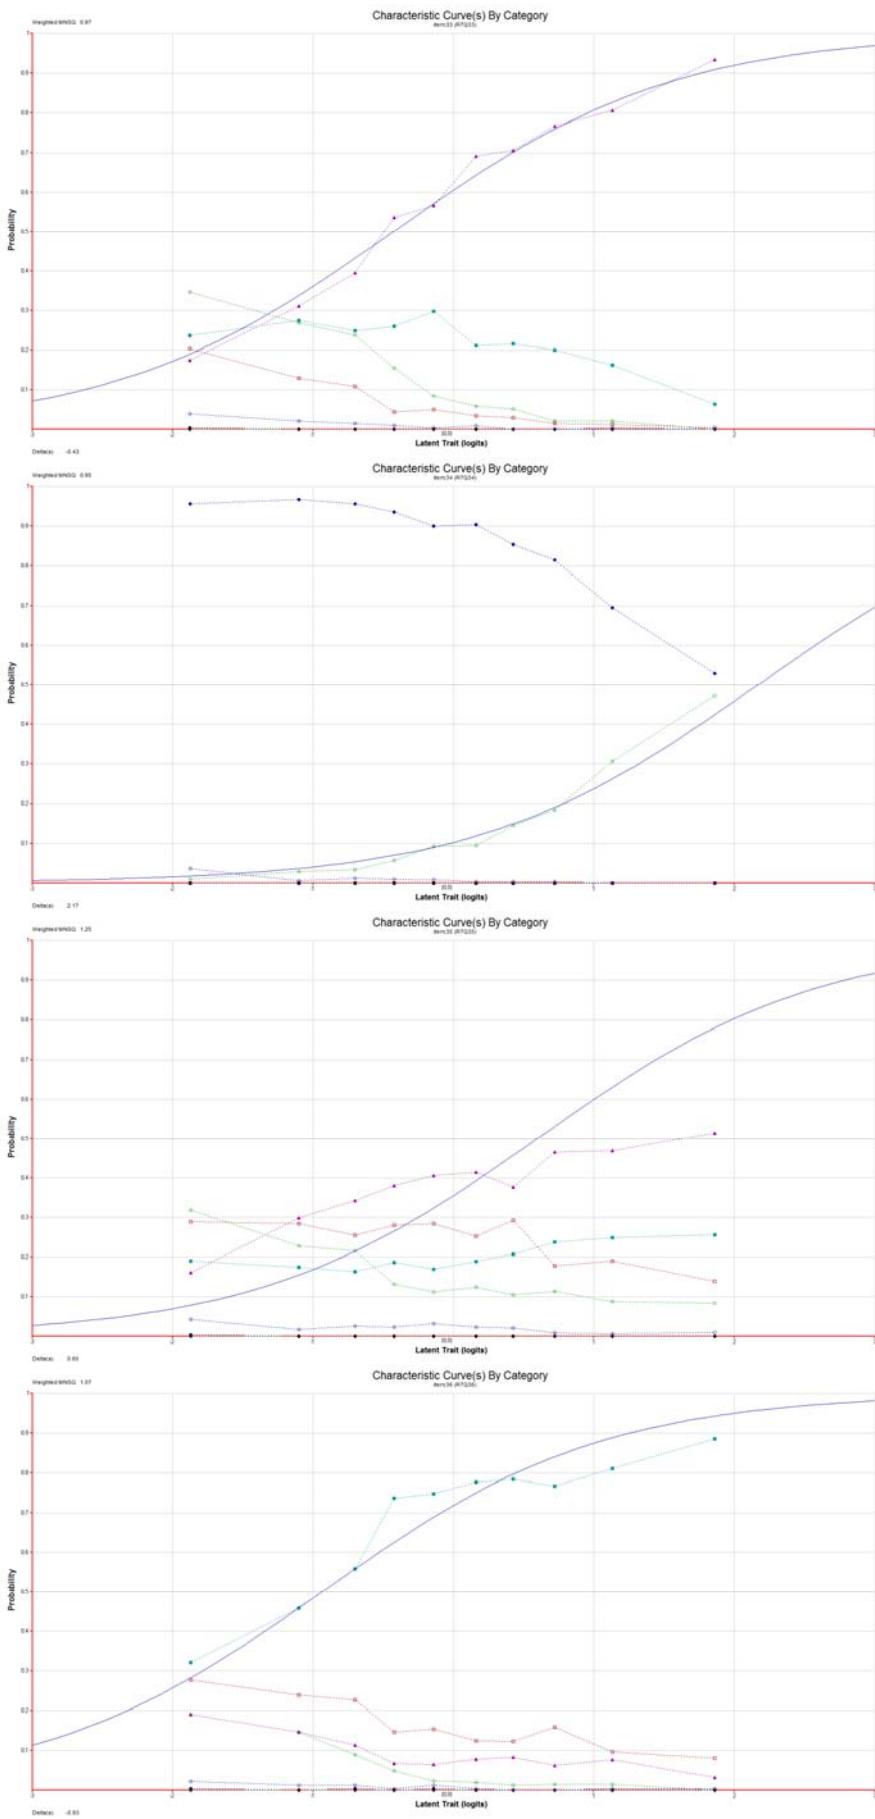

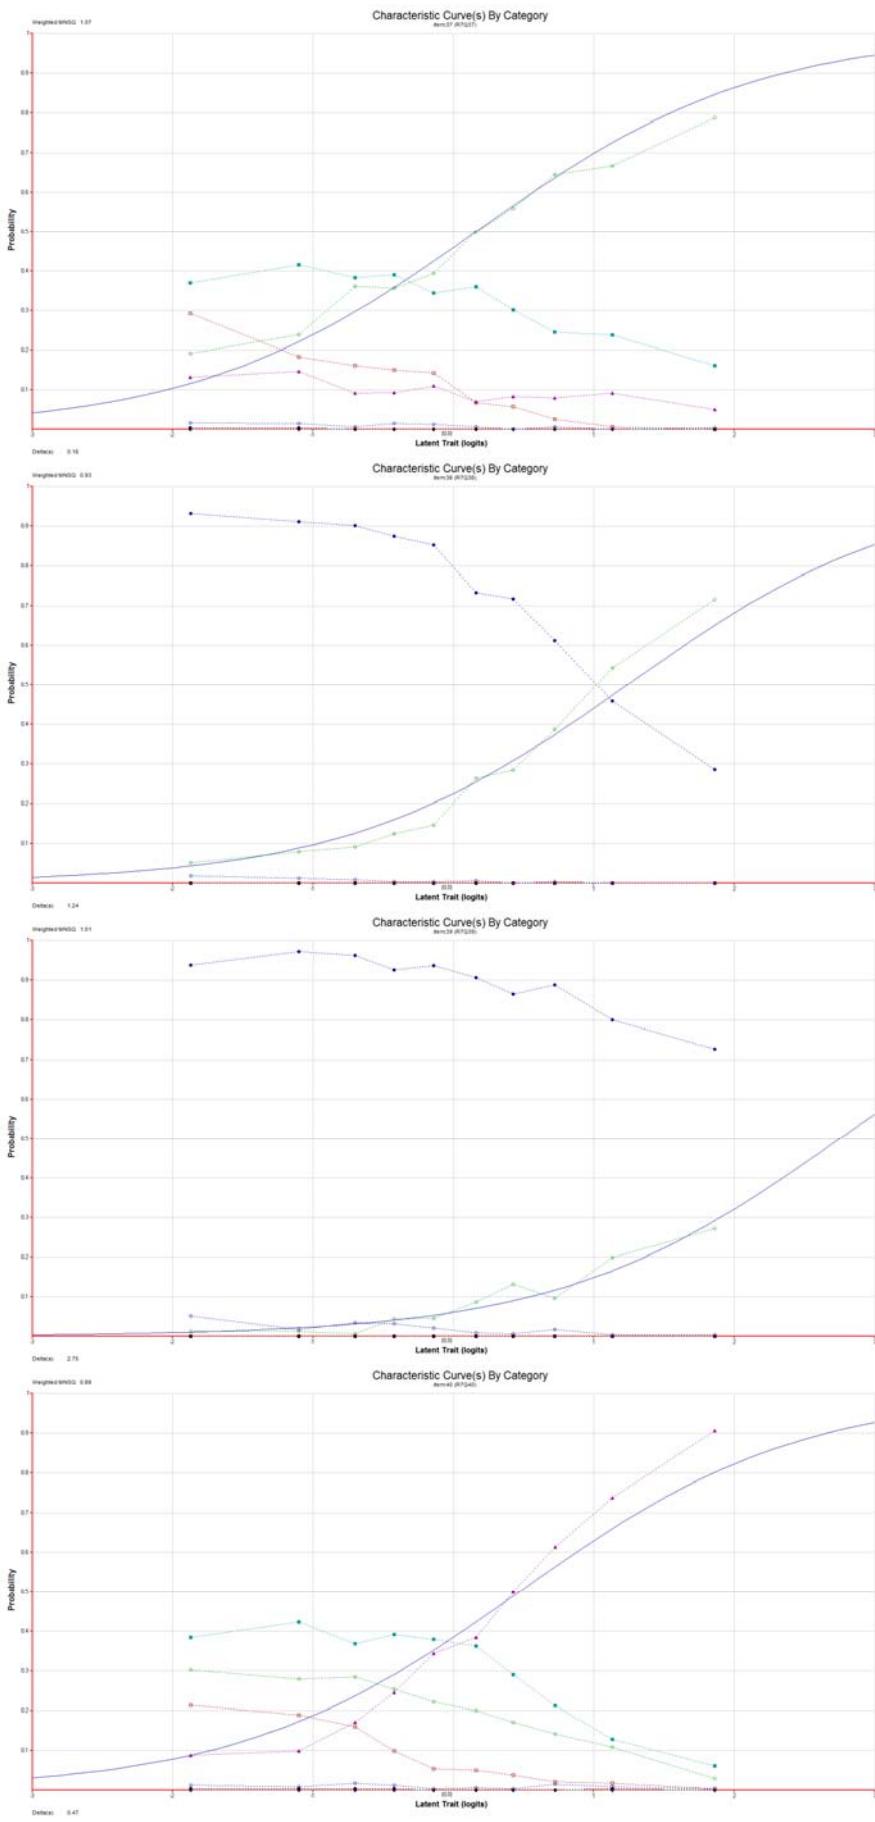

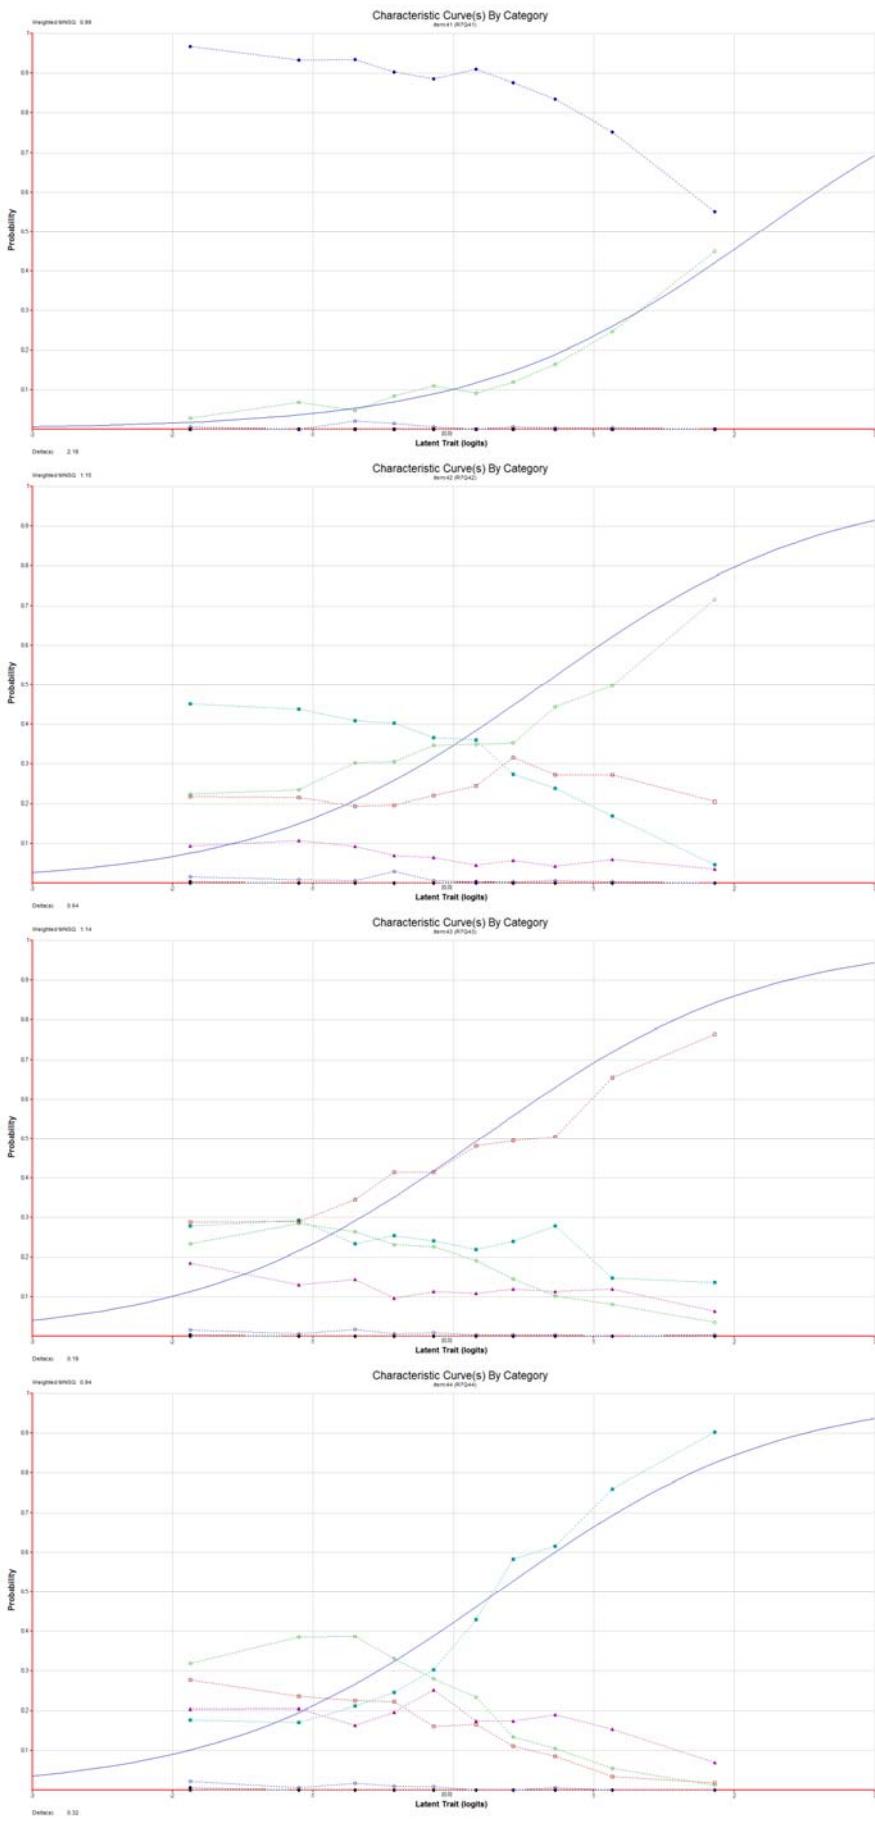

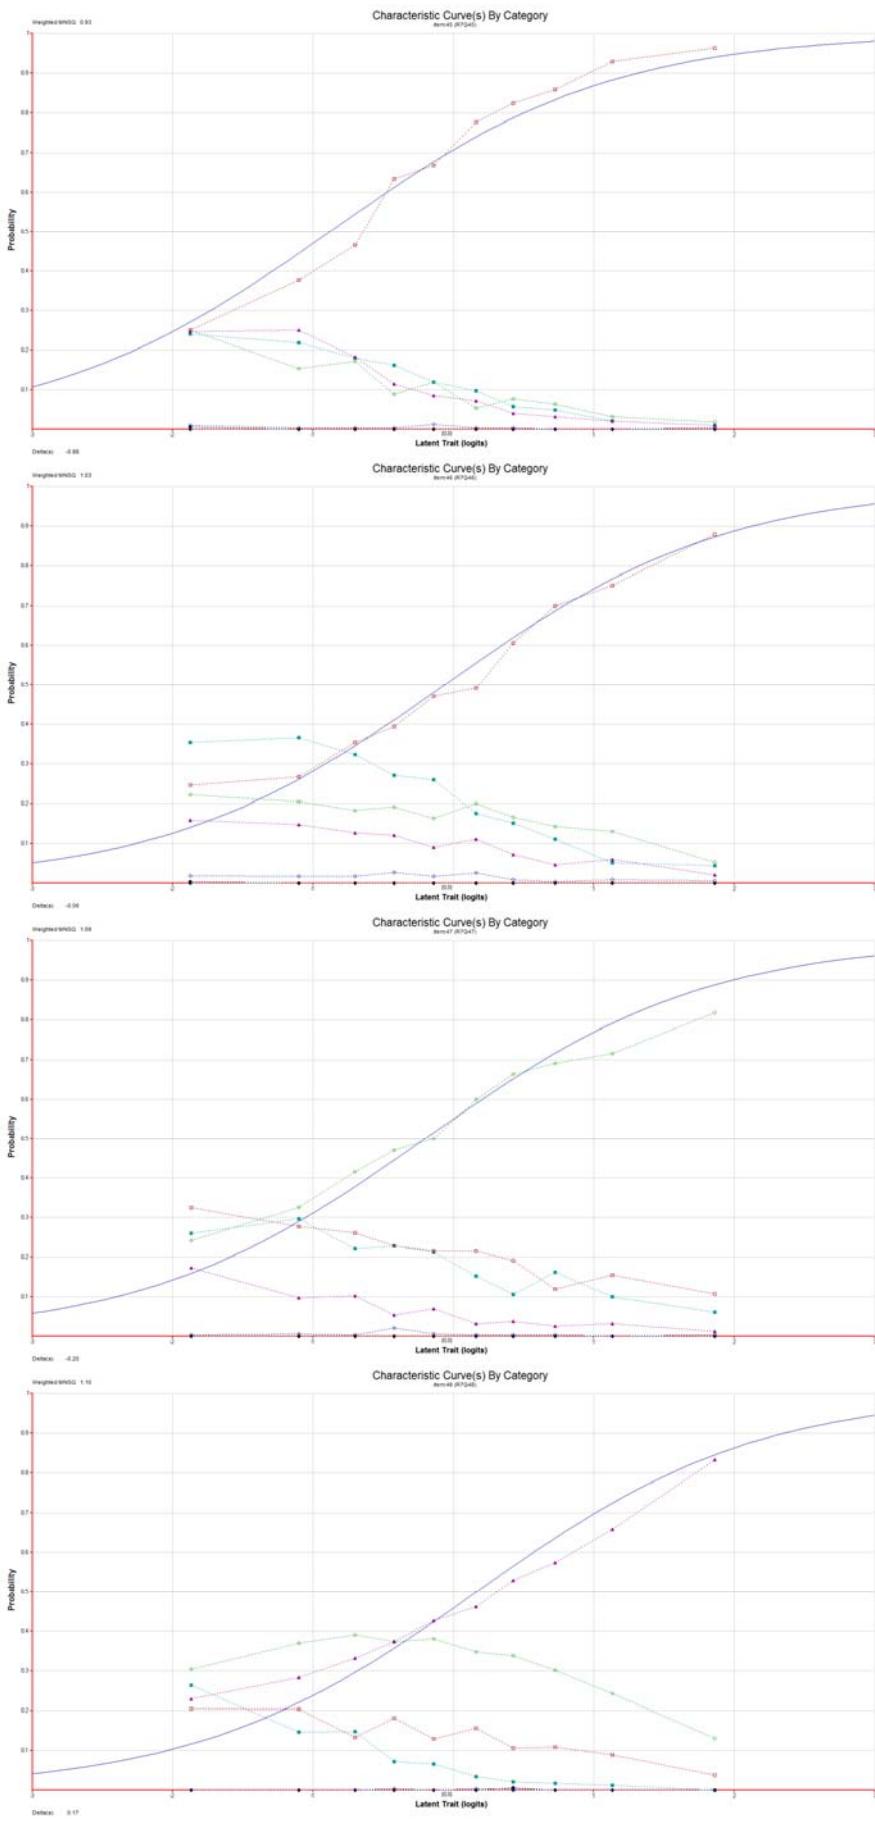

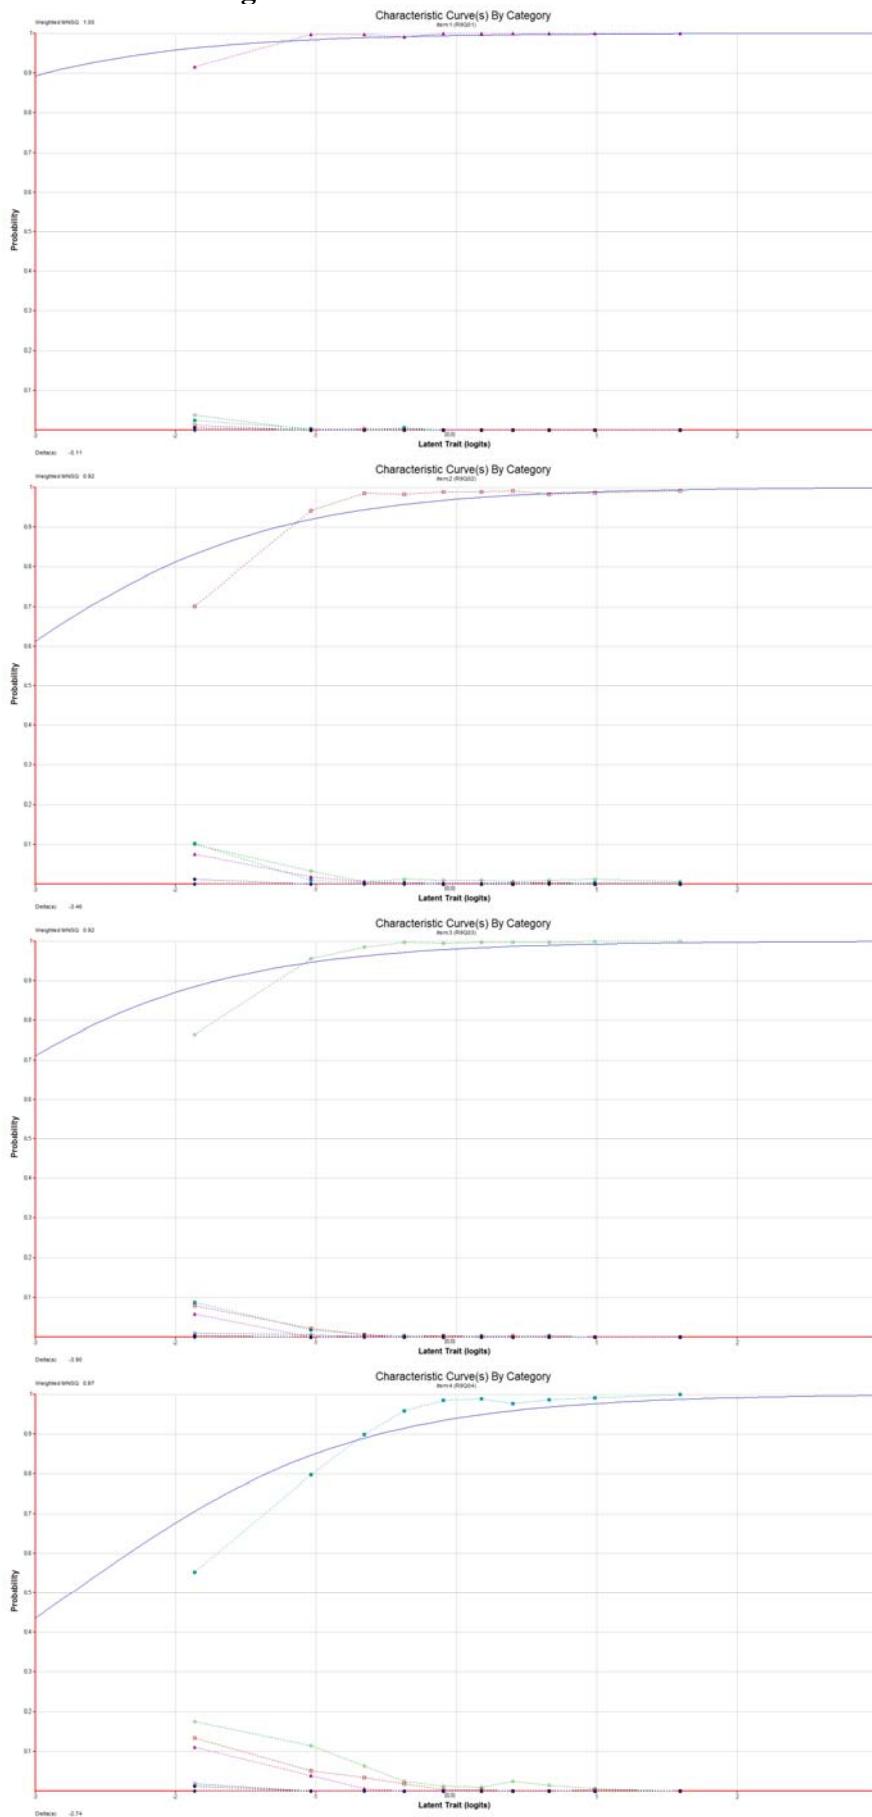

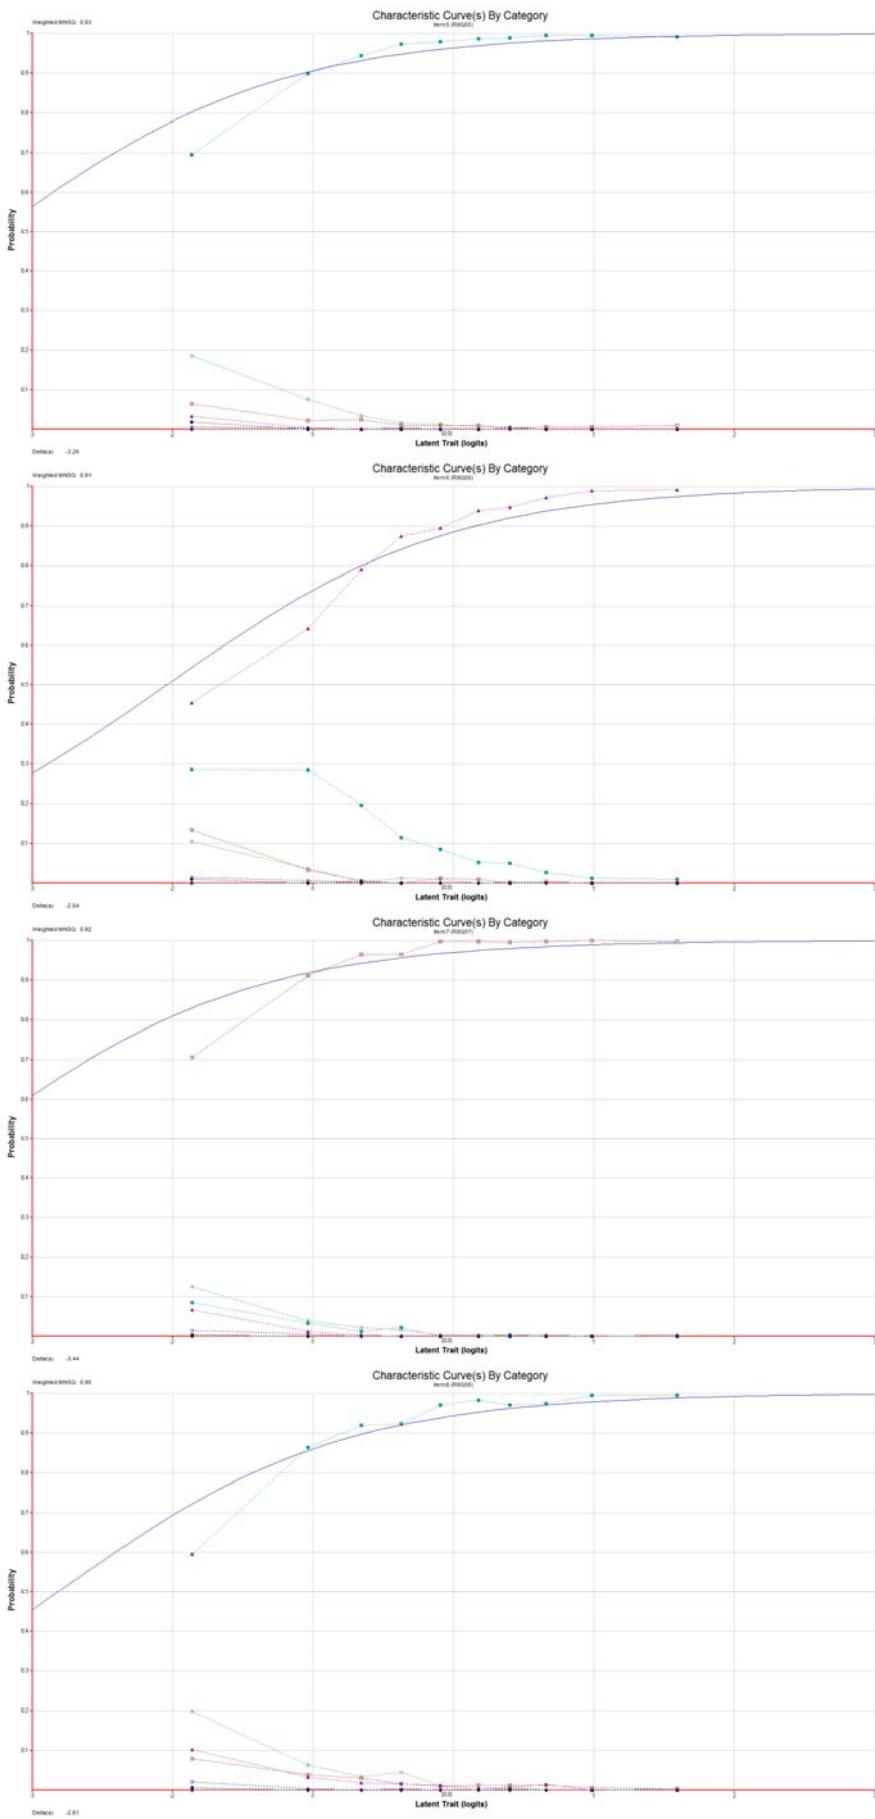

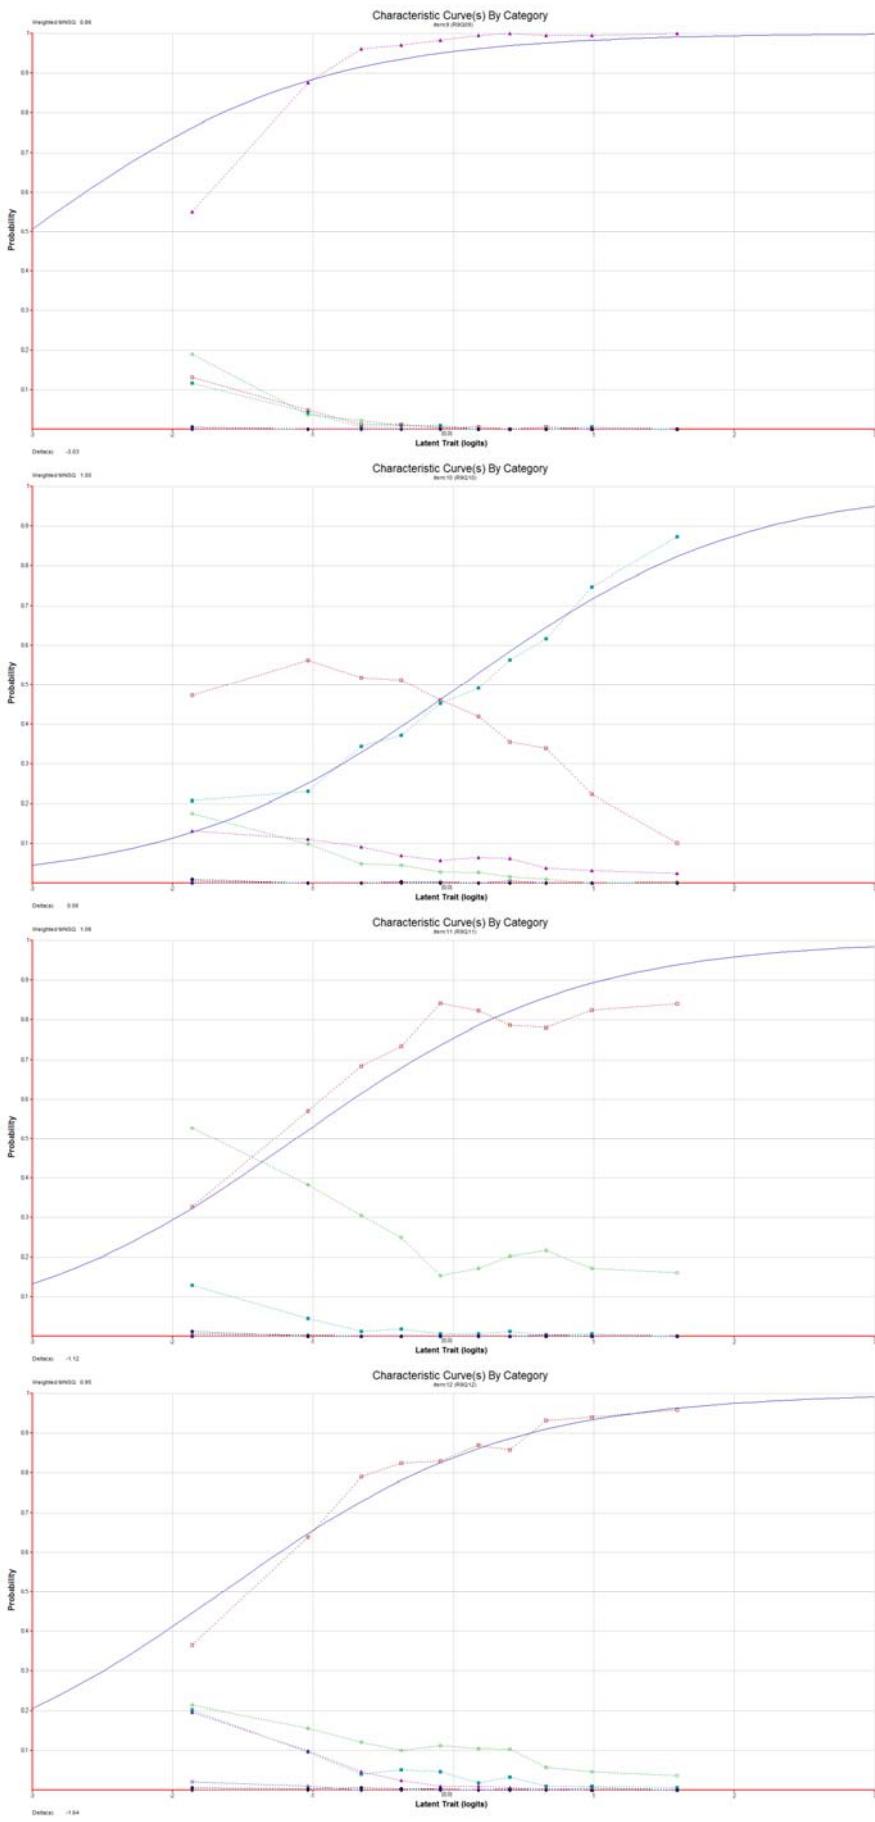

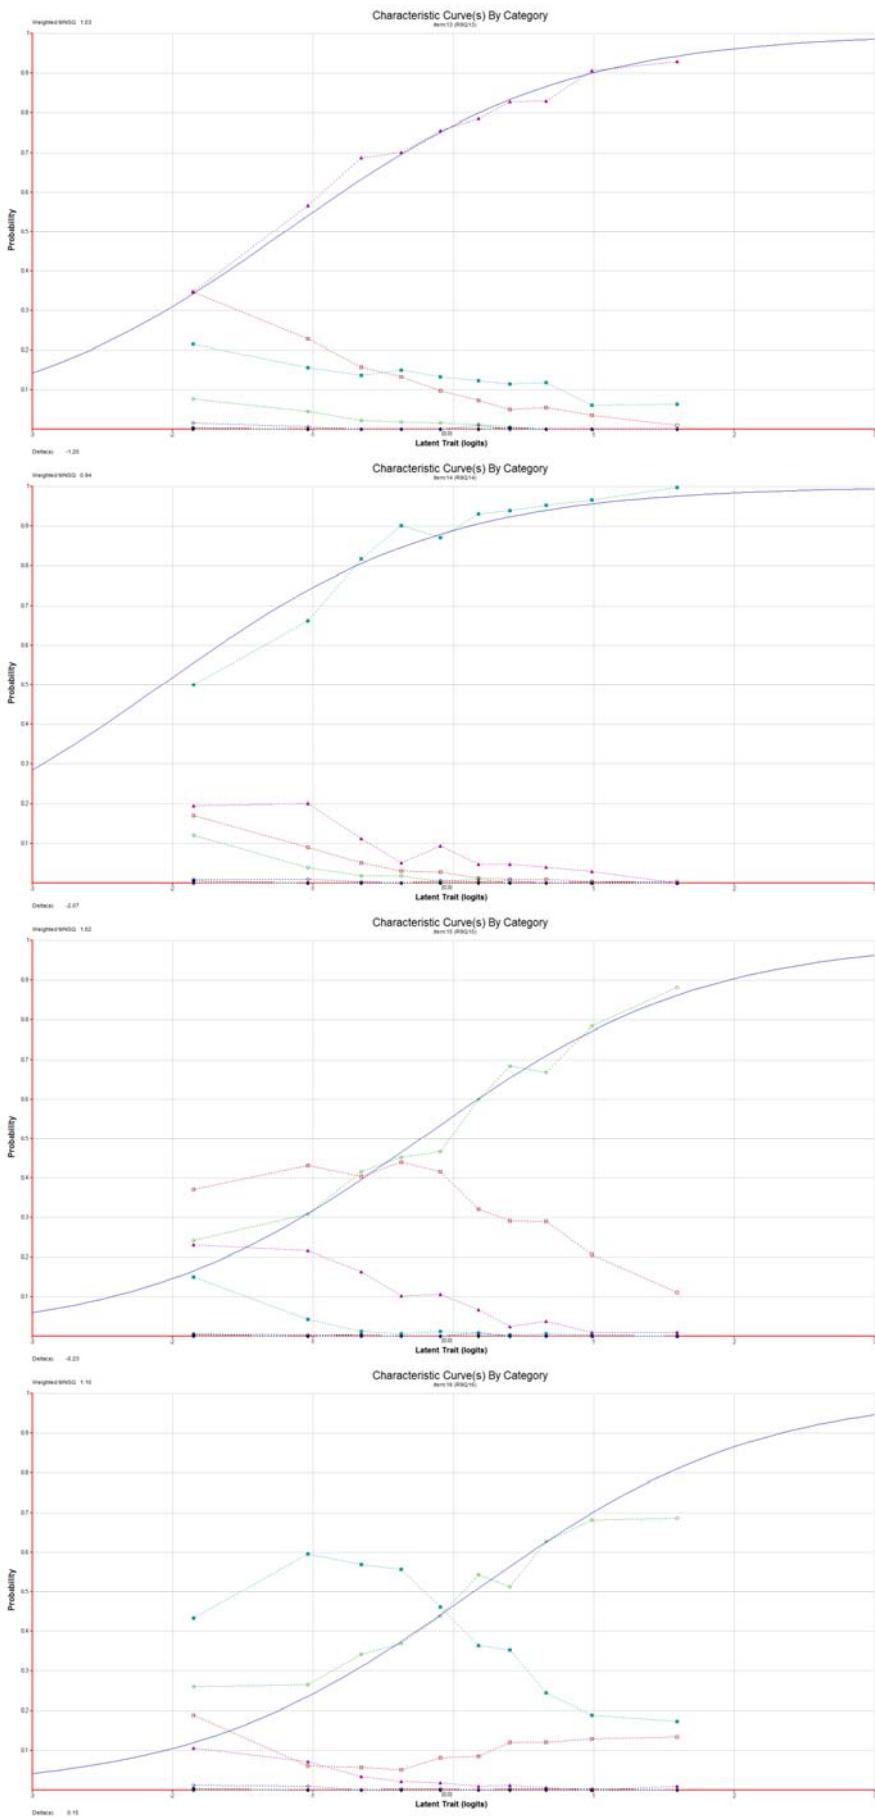

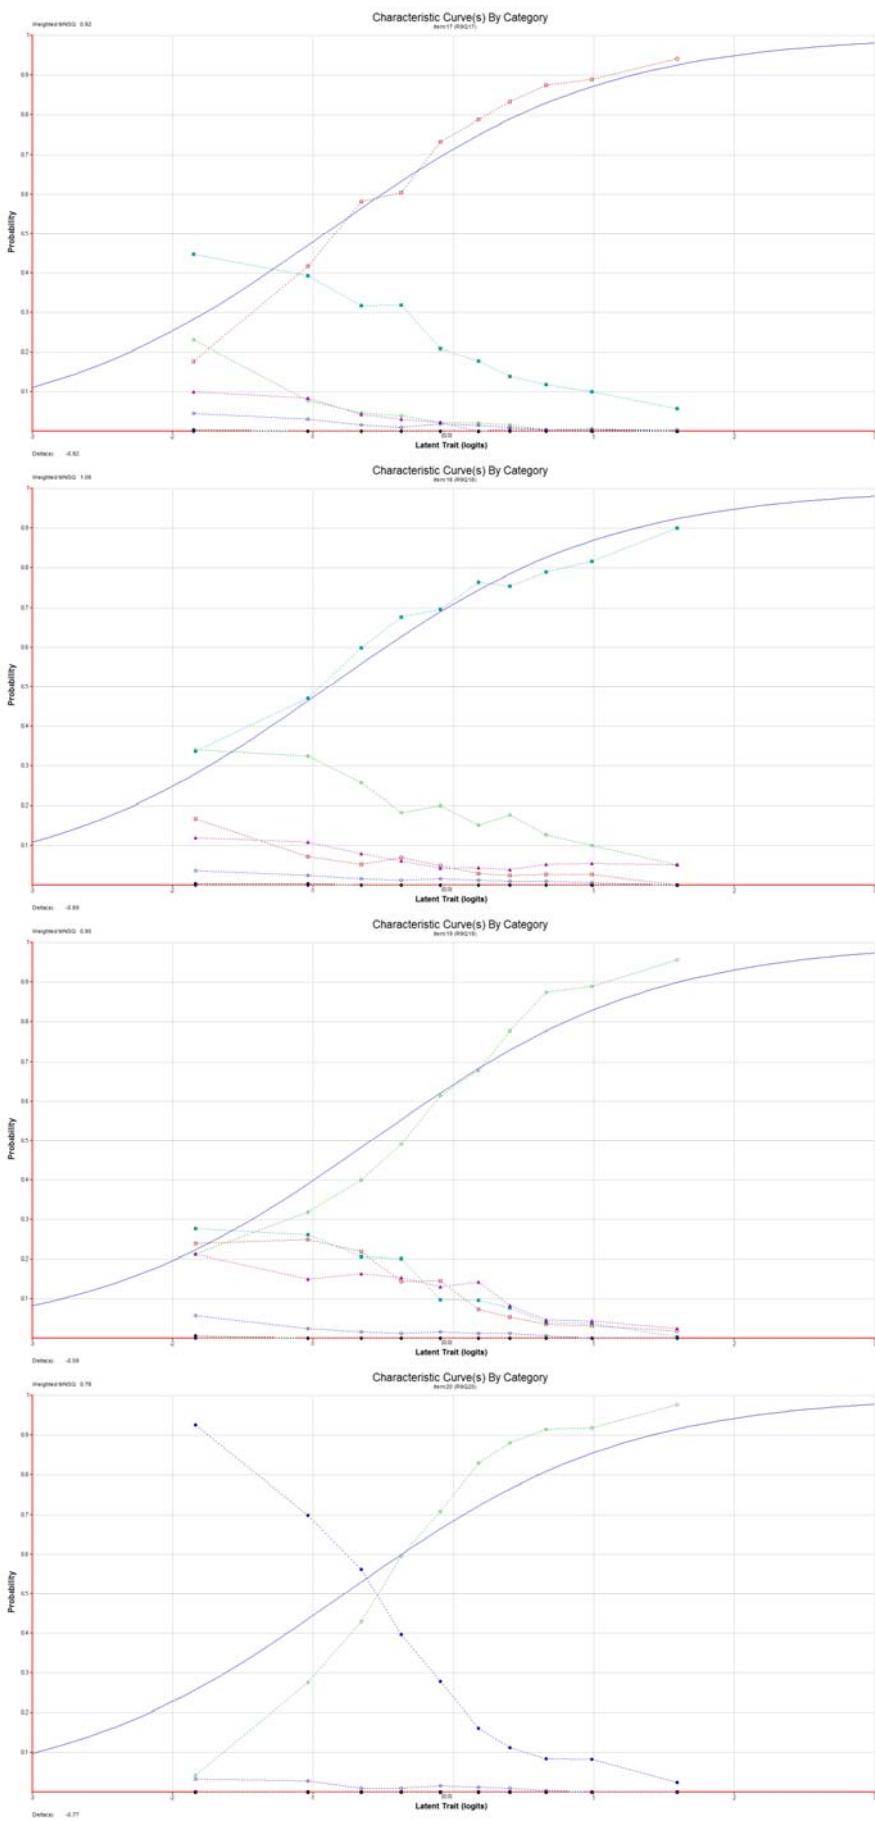

## D.4. Year 9 Reading

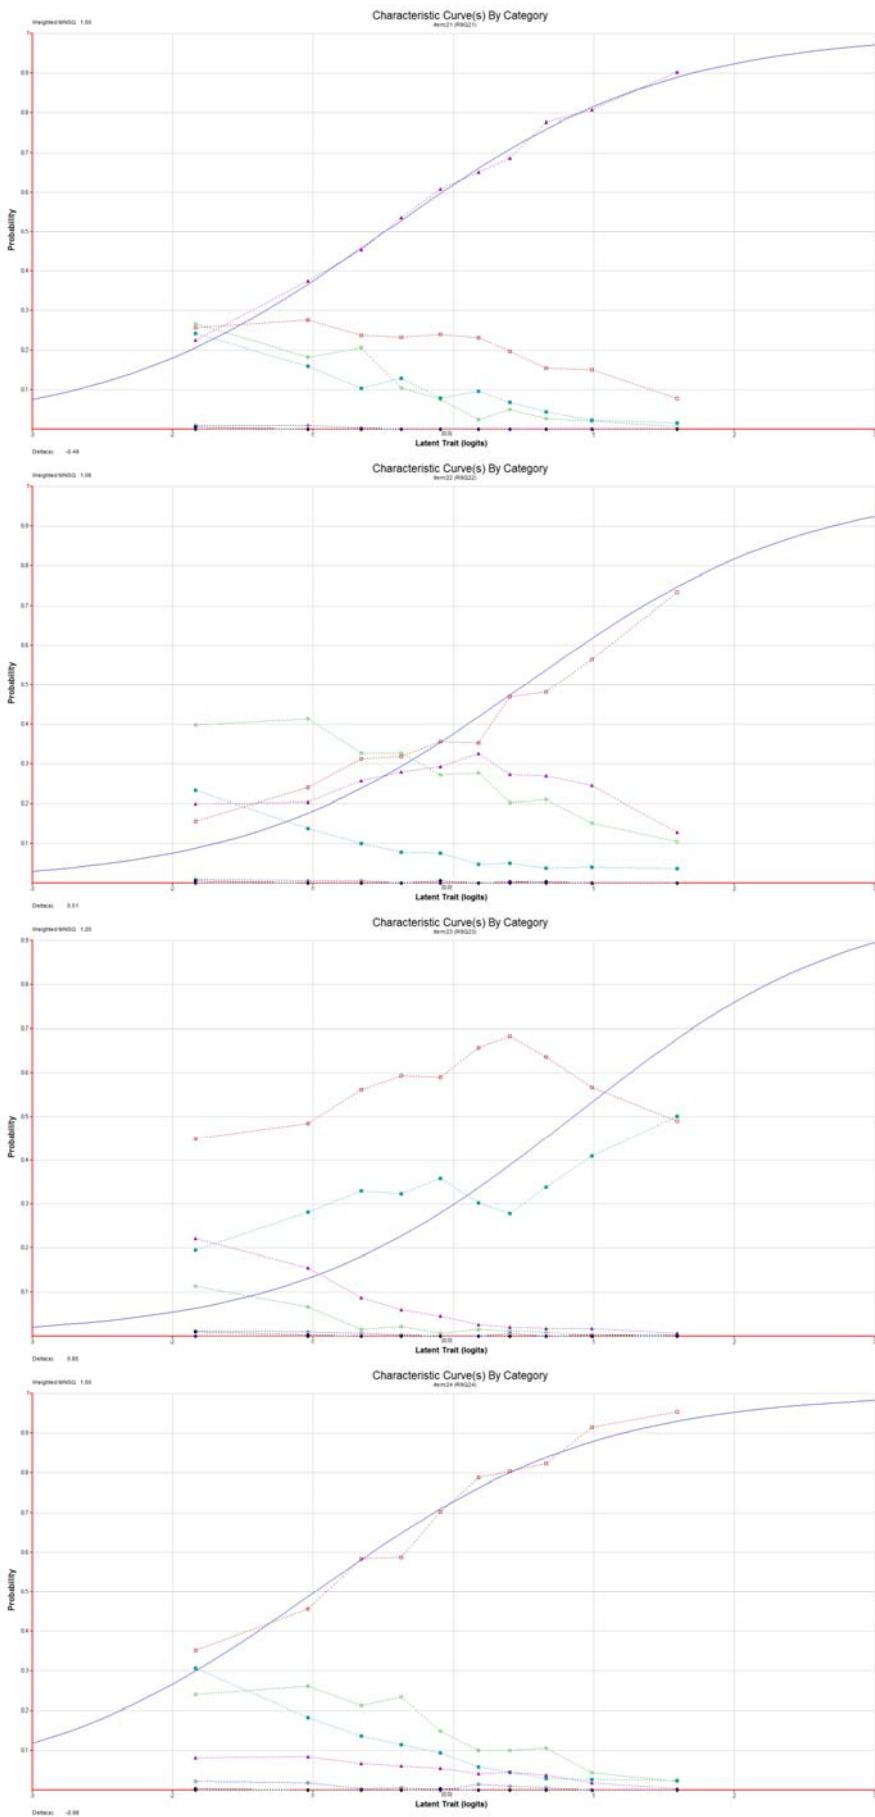

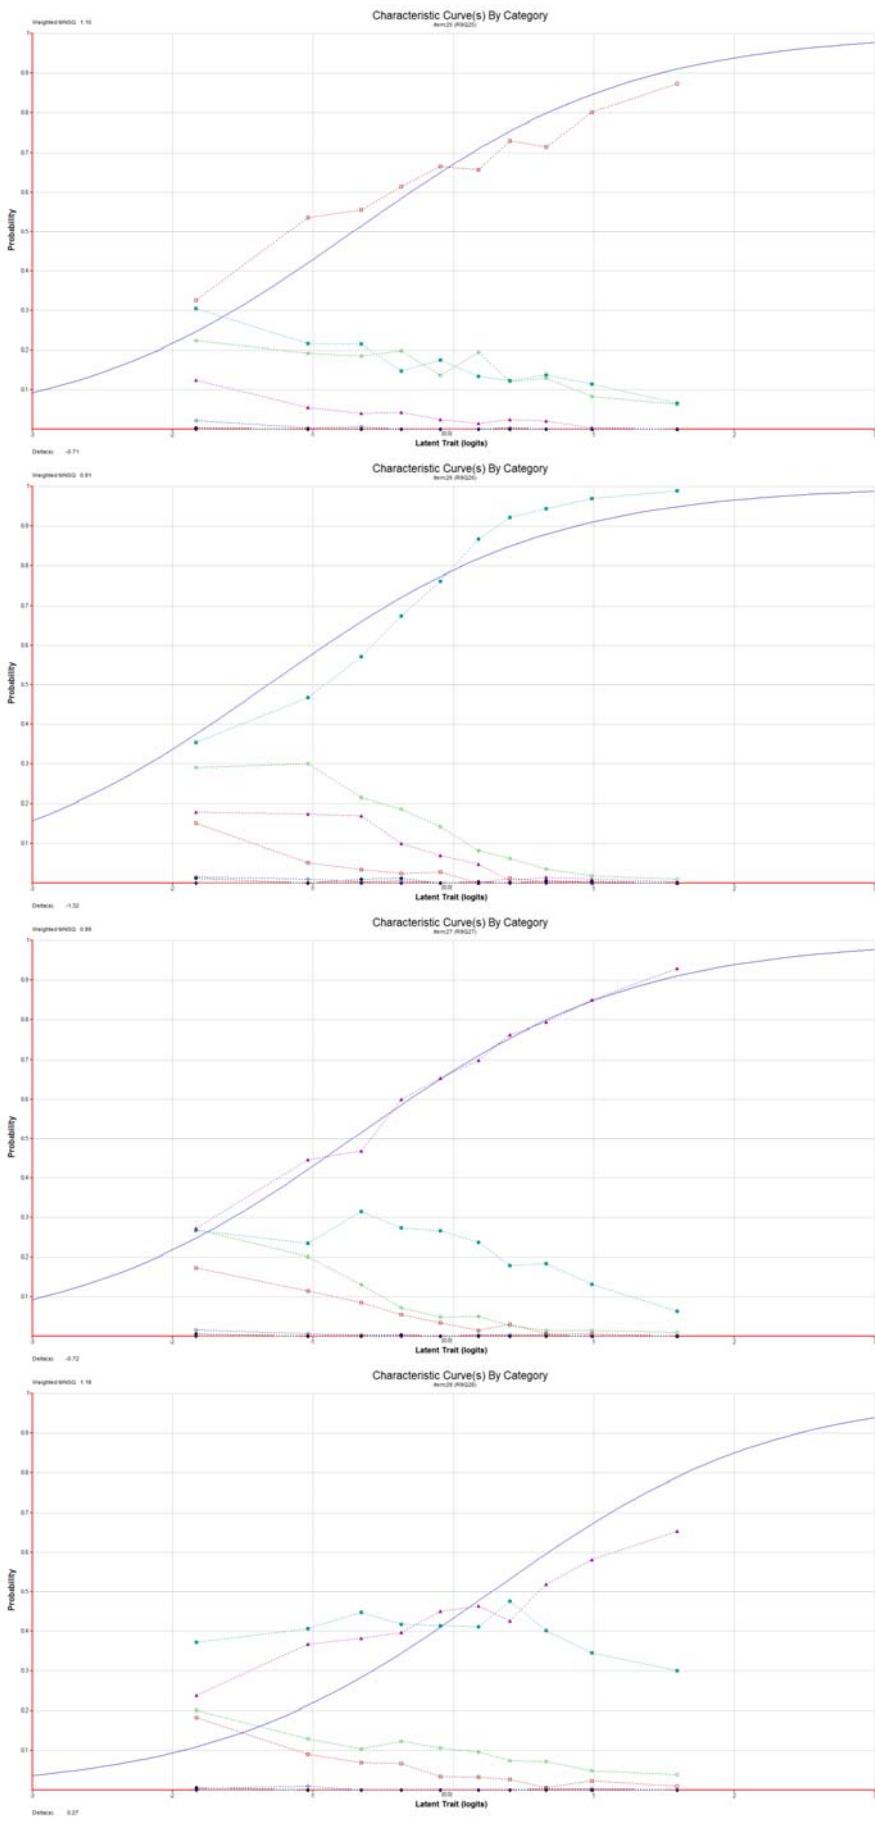

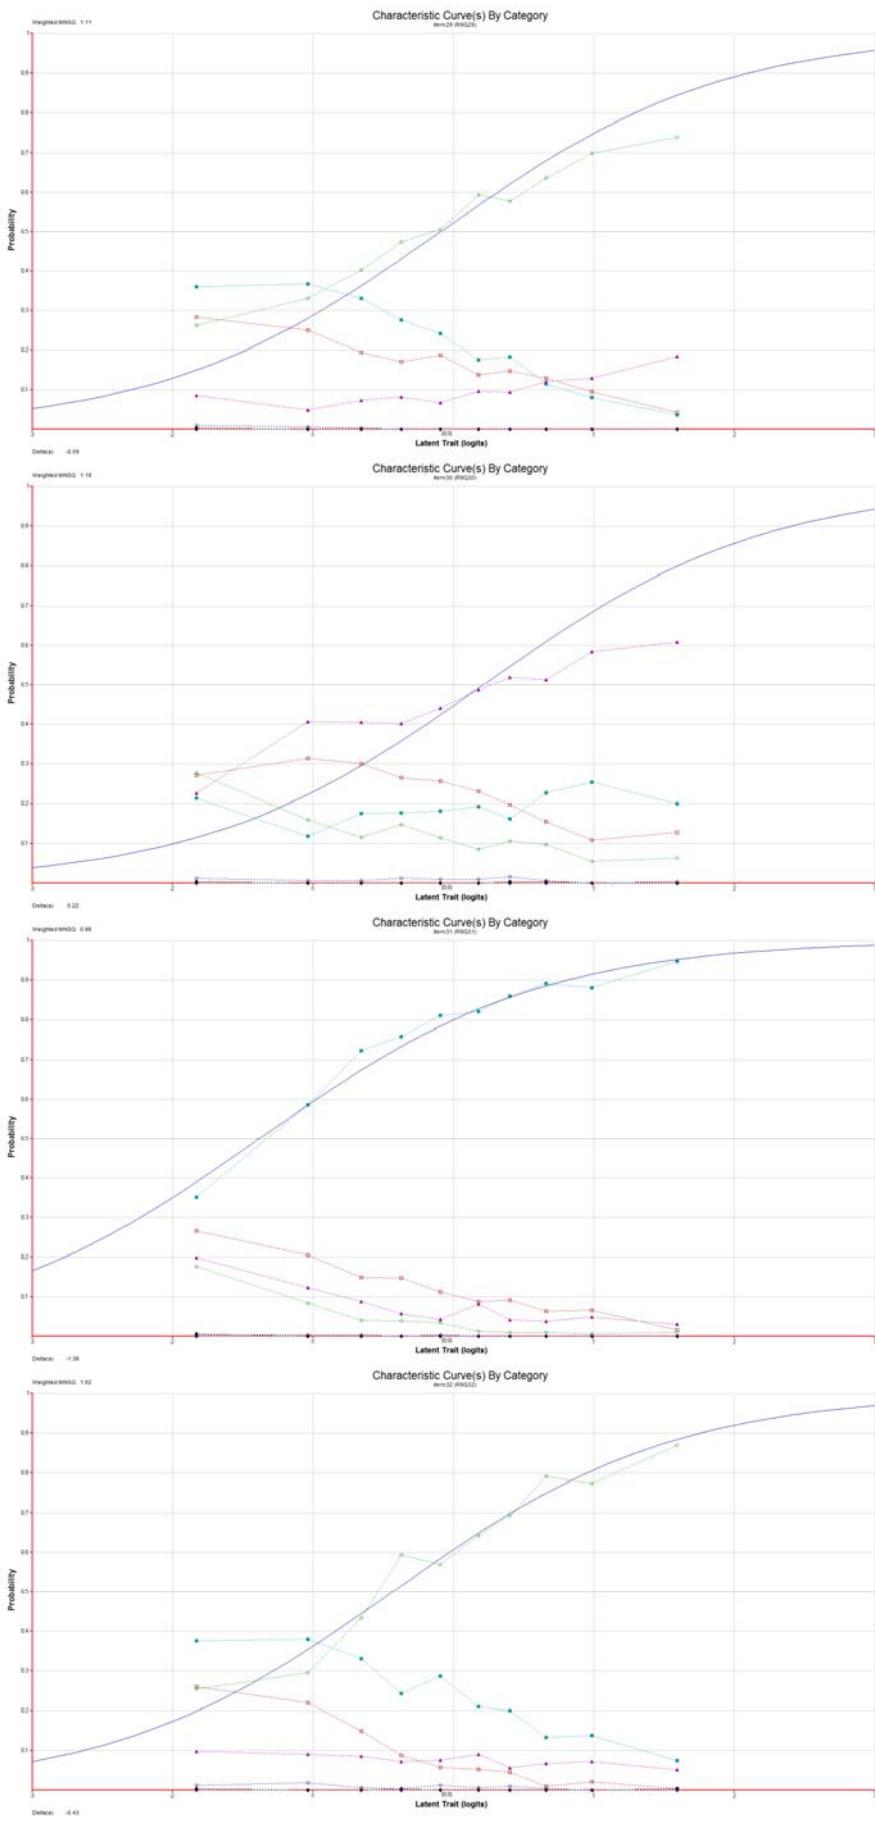

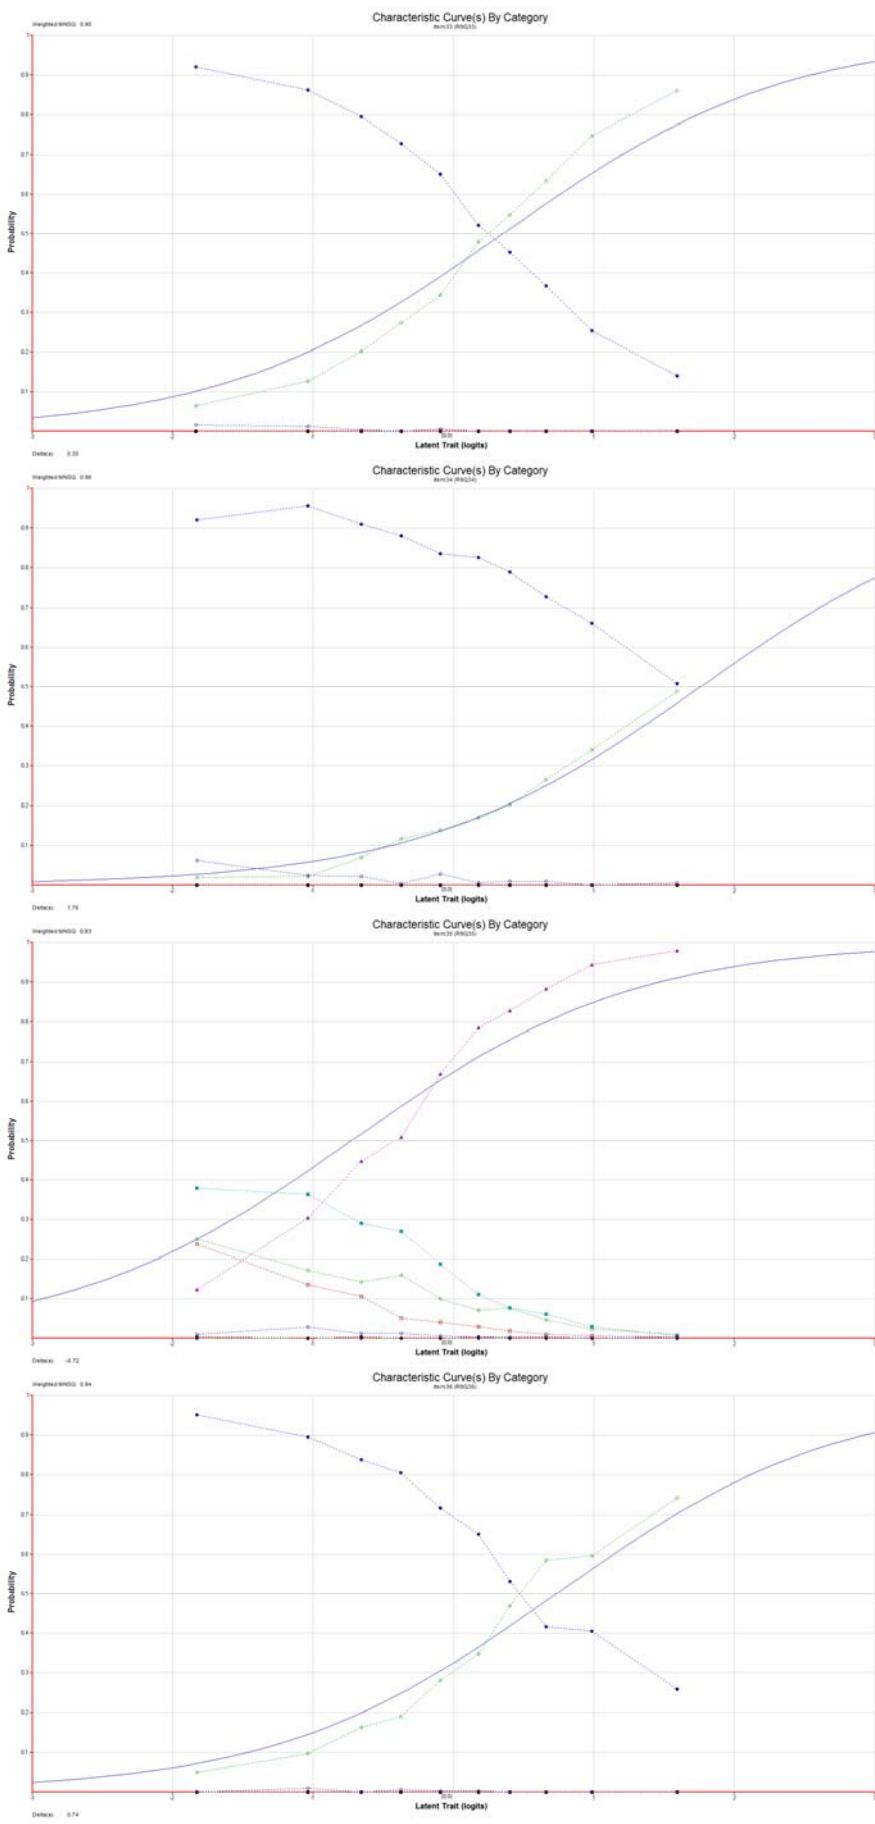

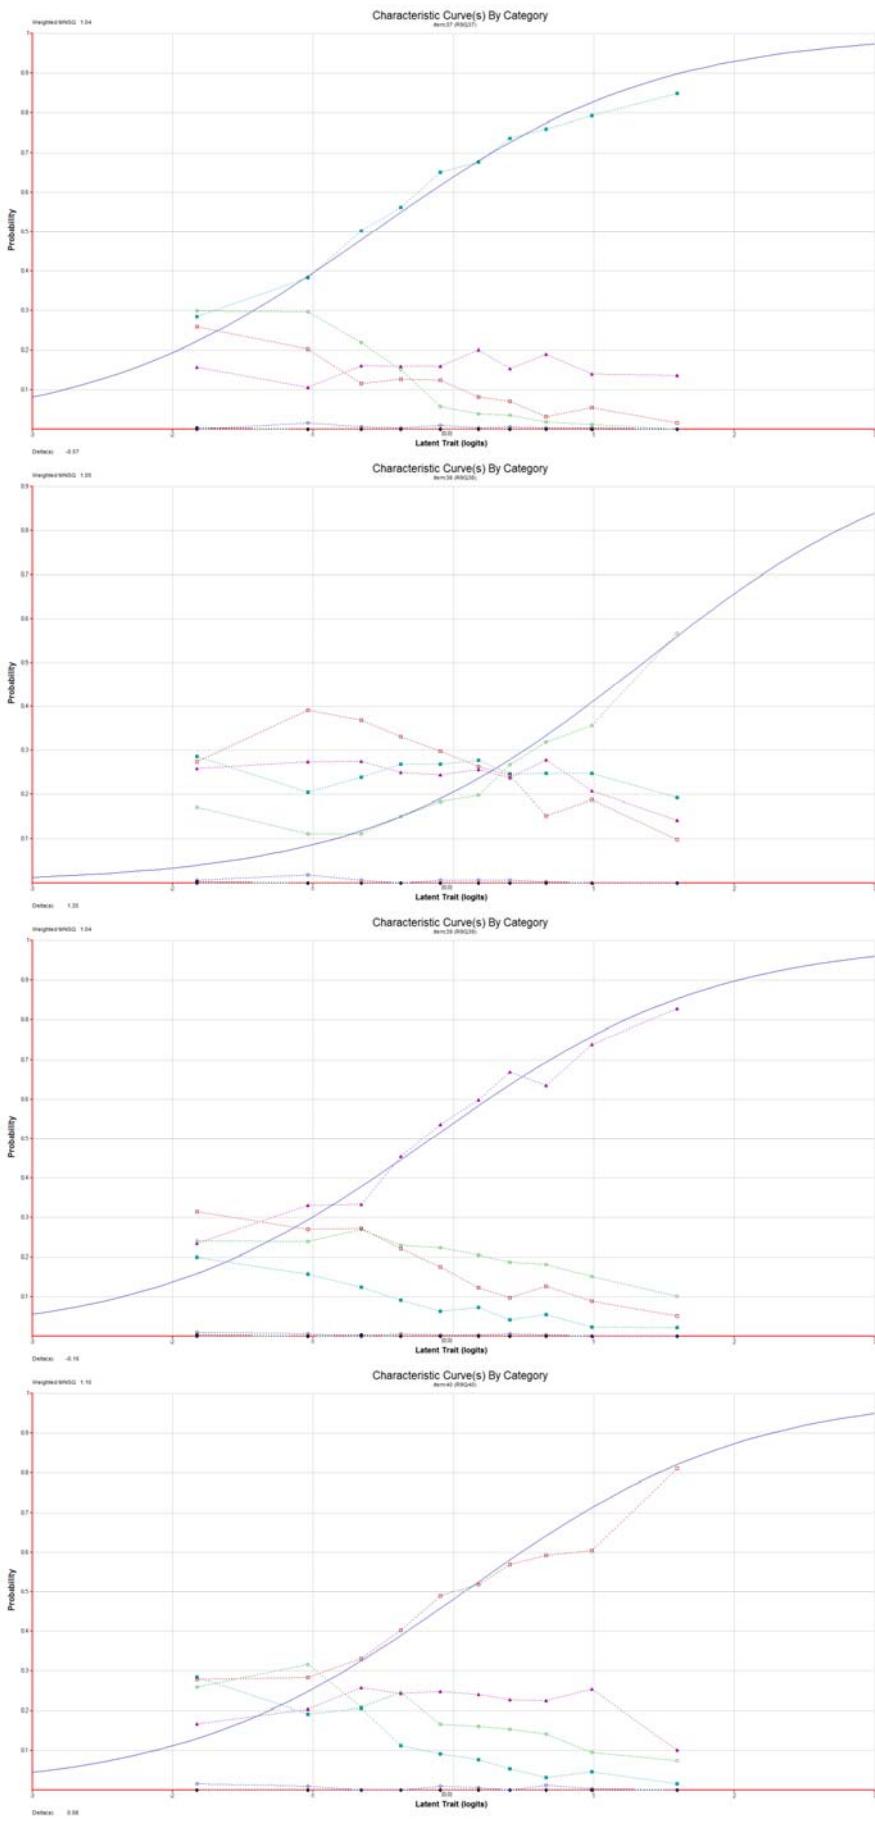

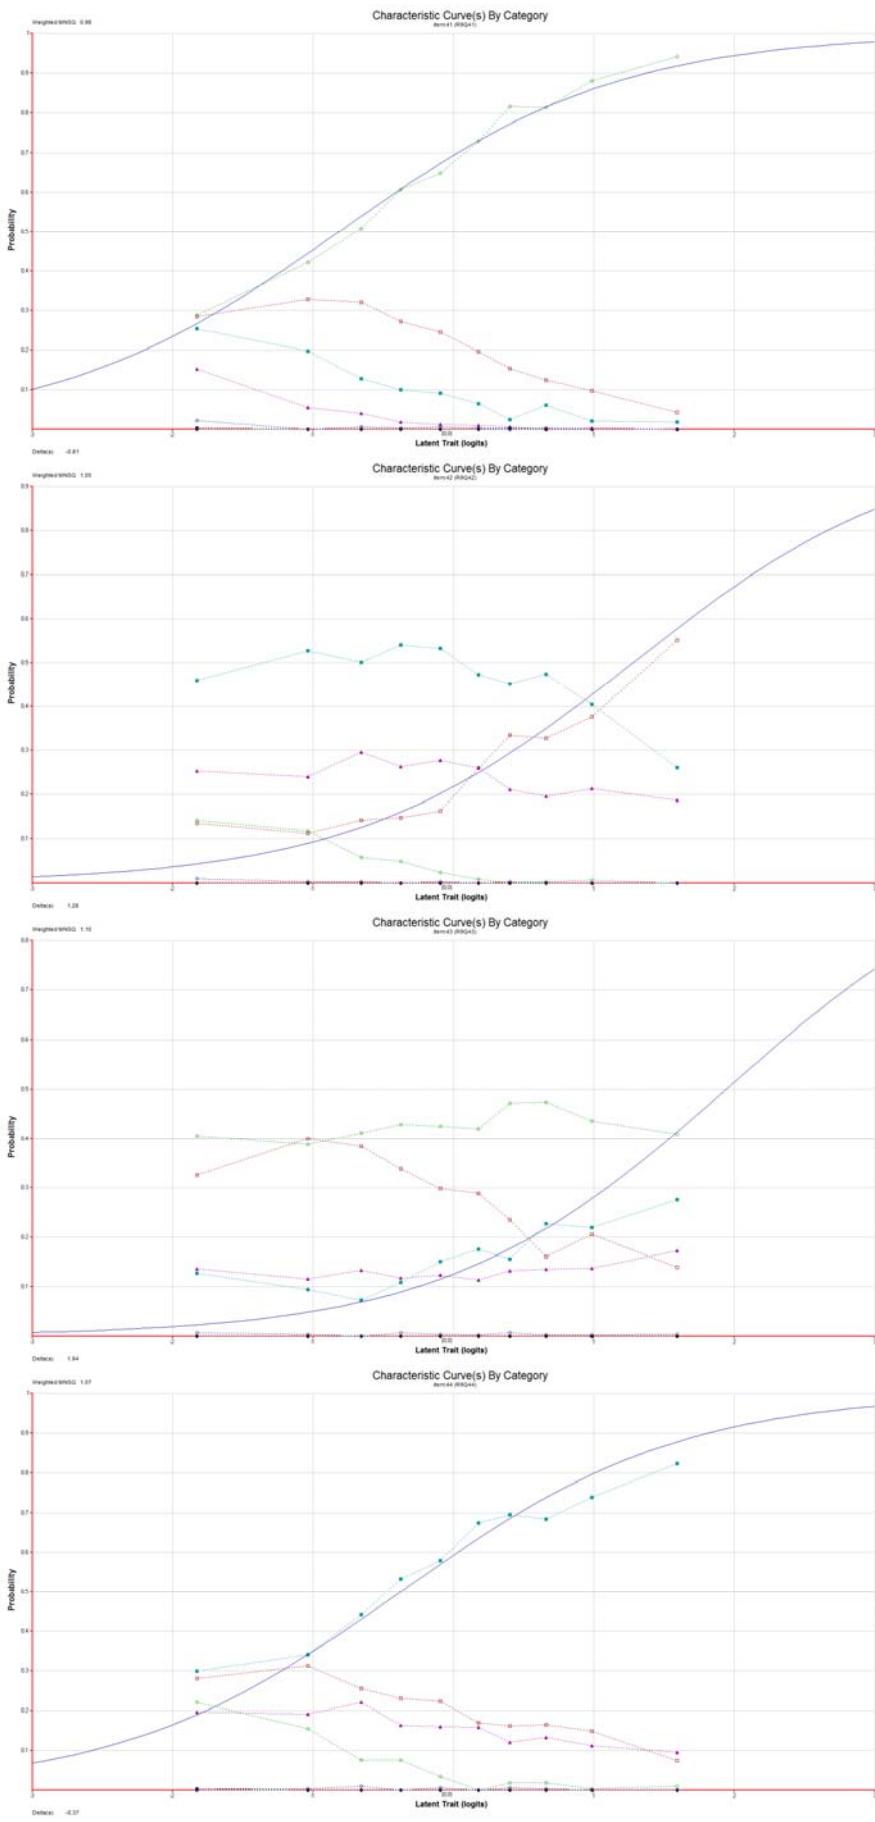

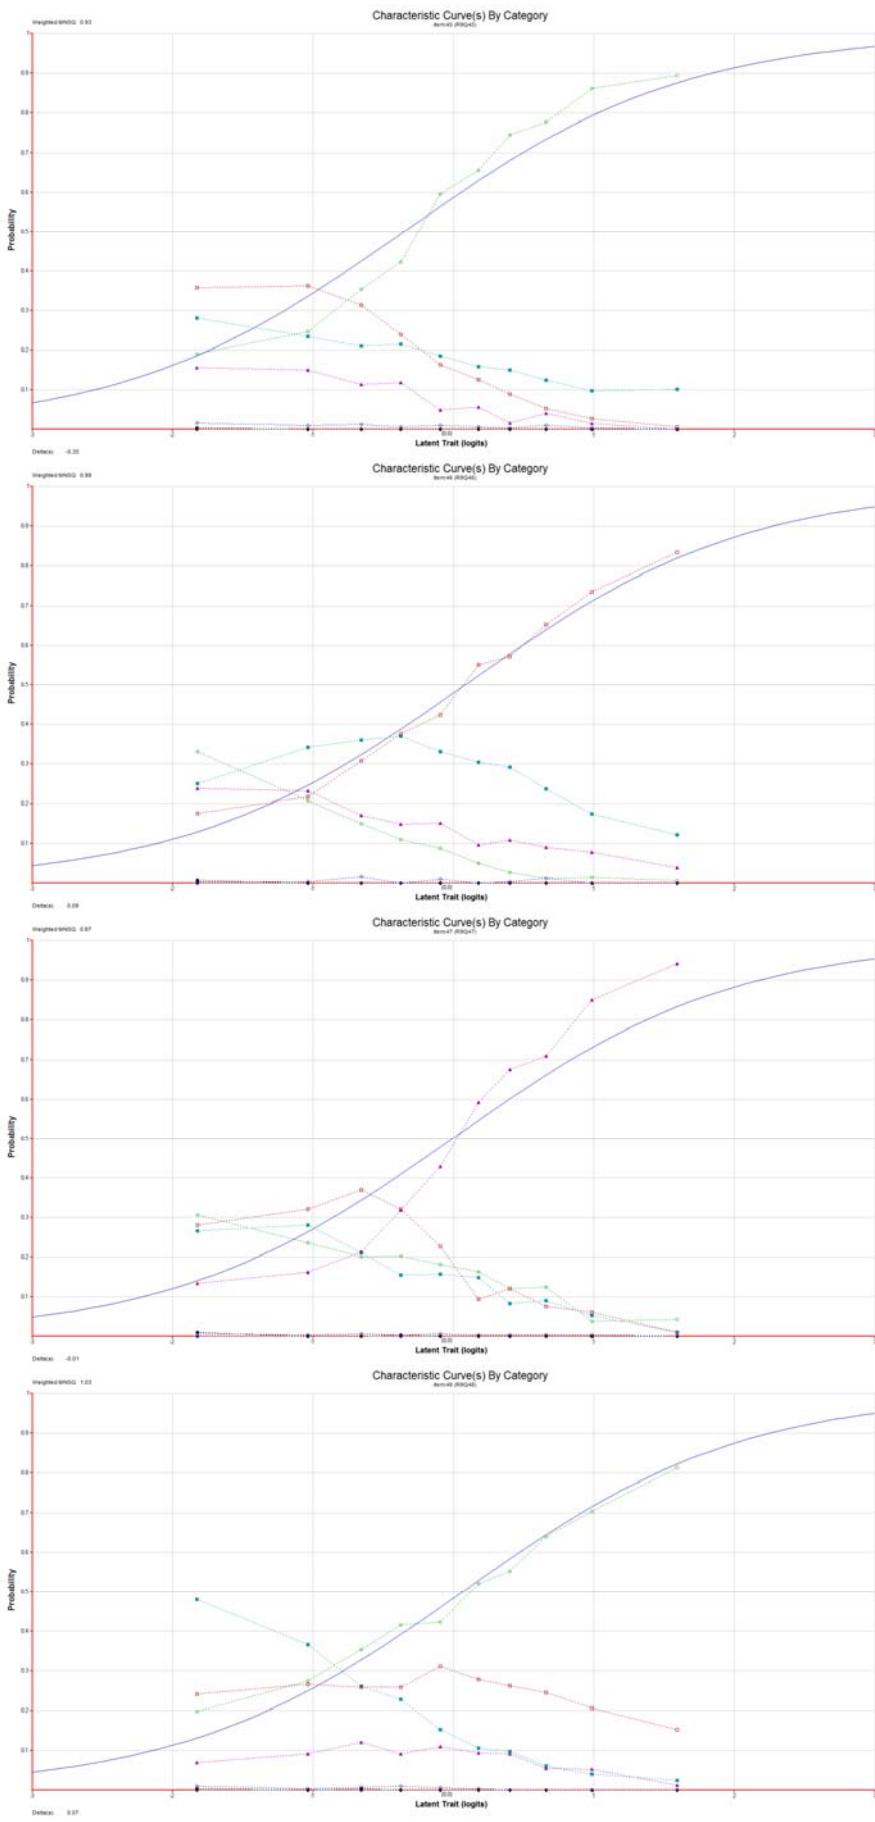

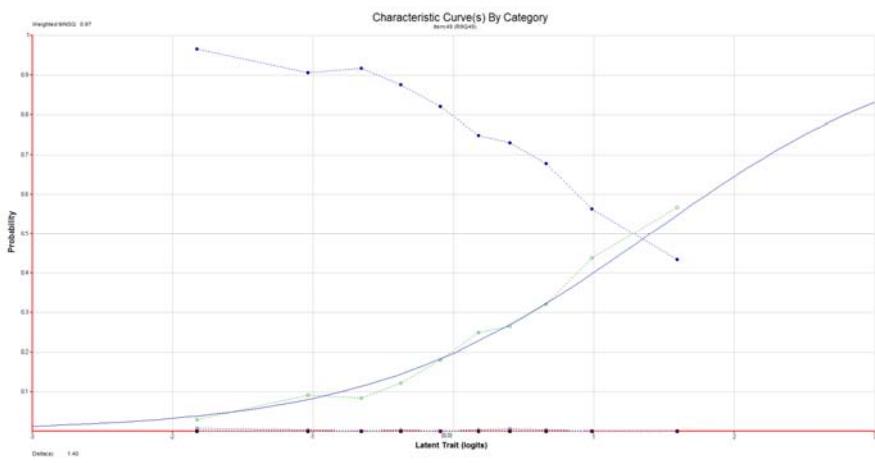

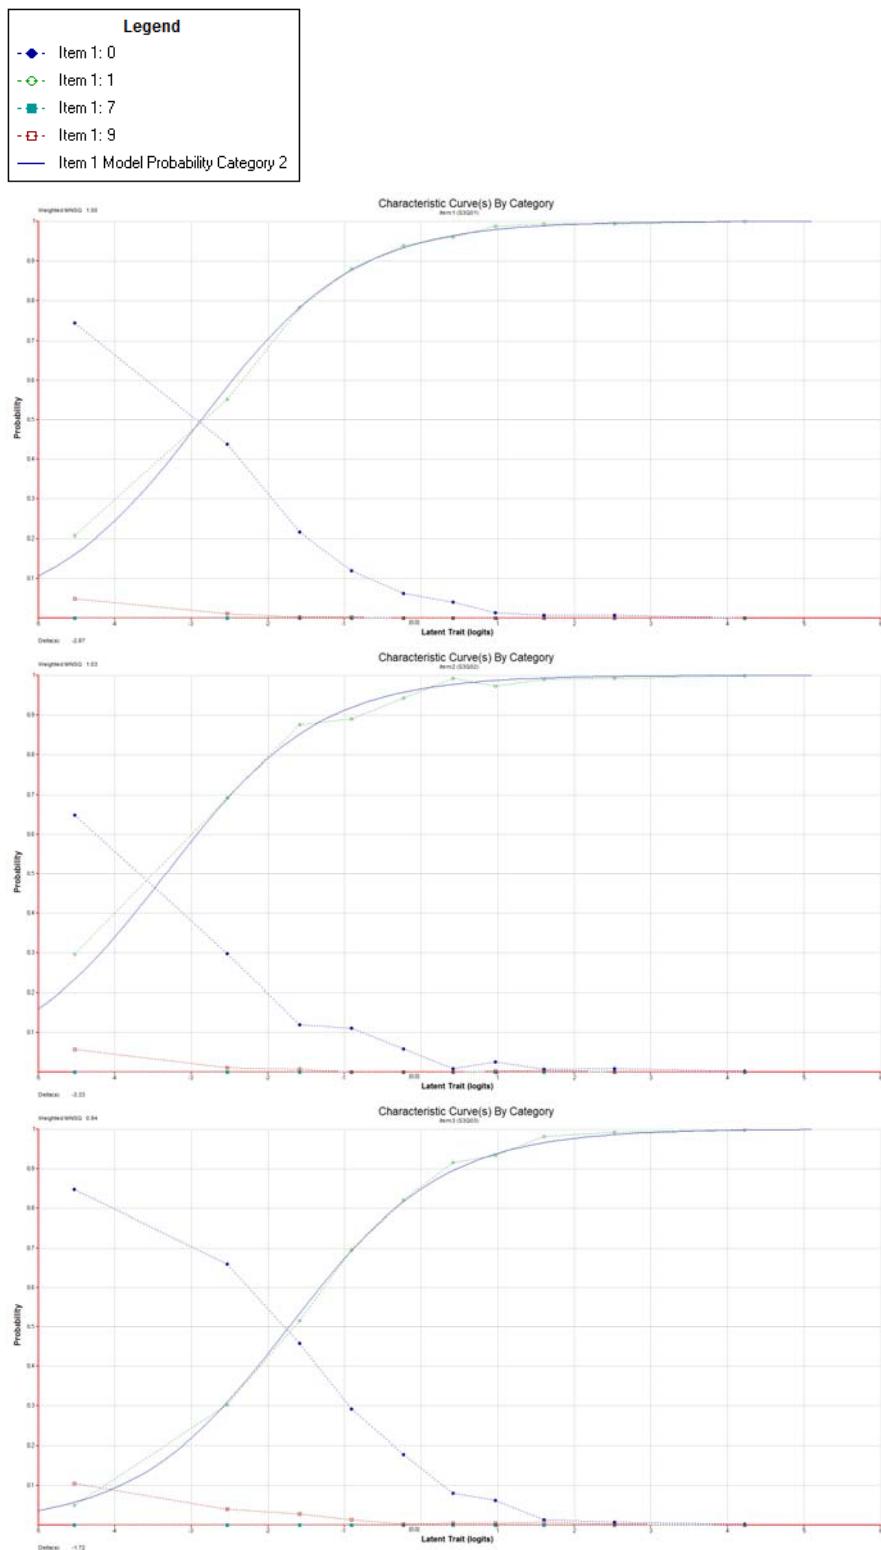

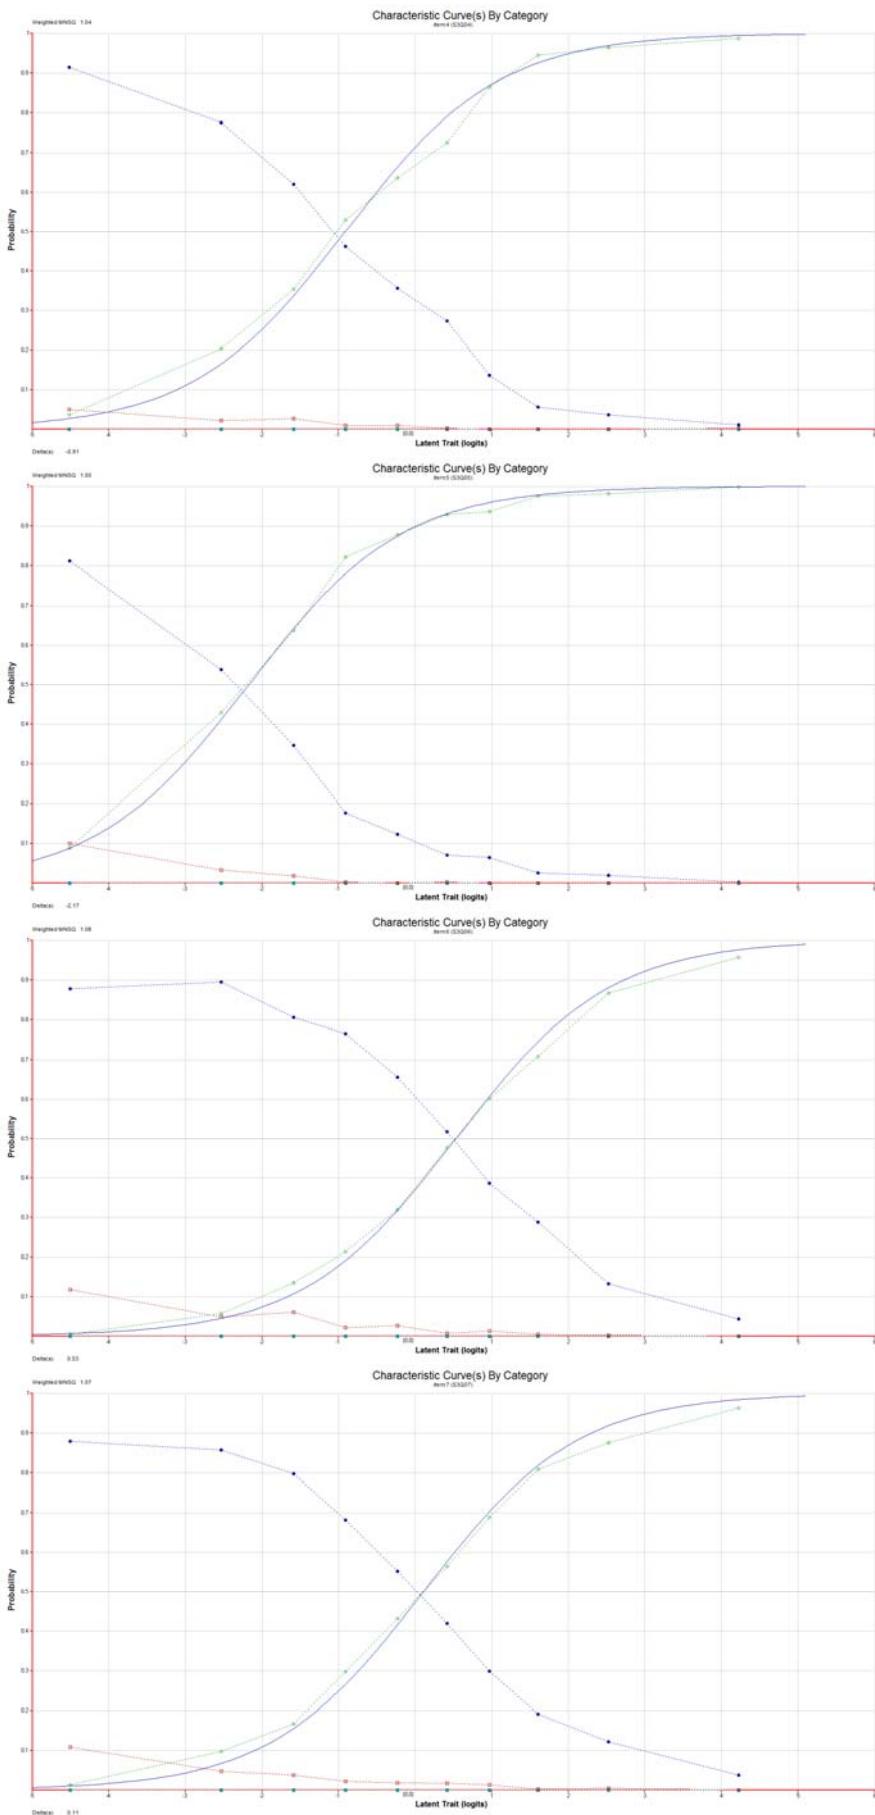

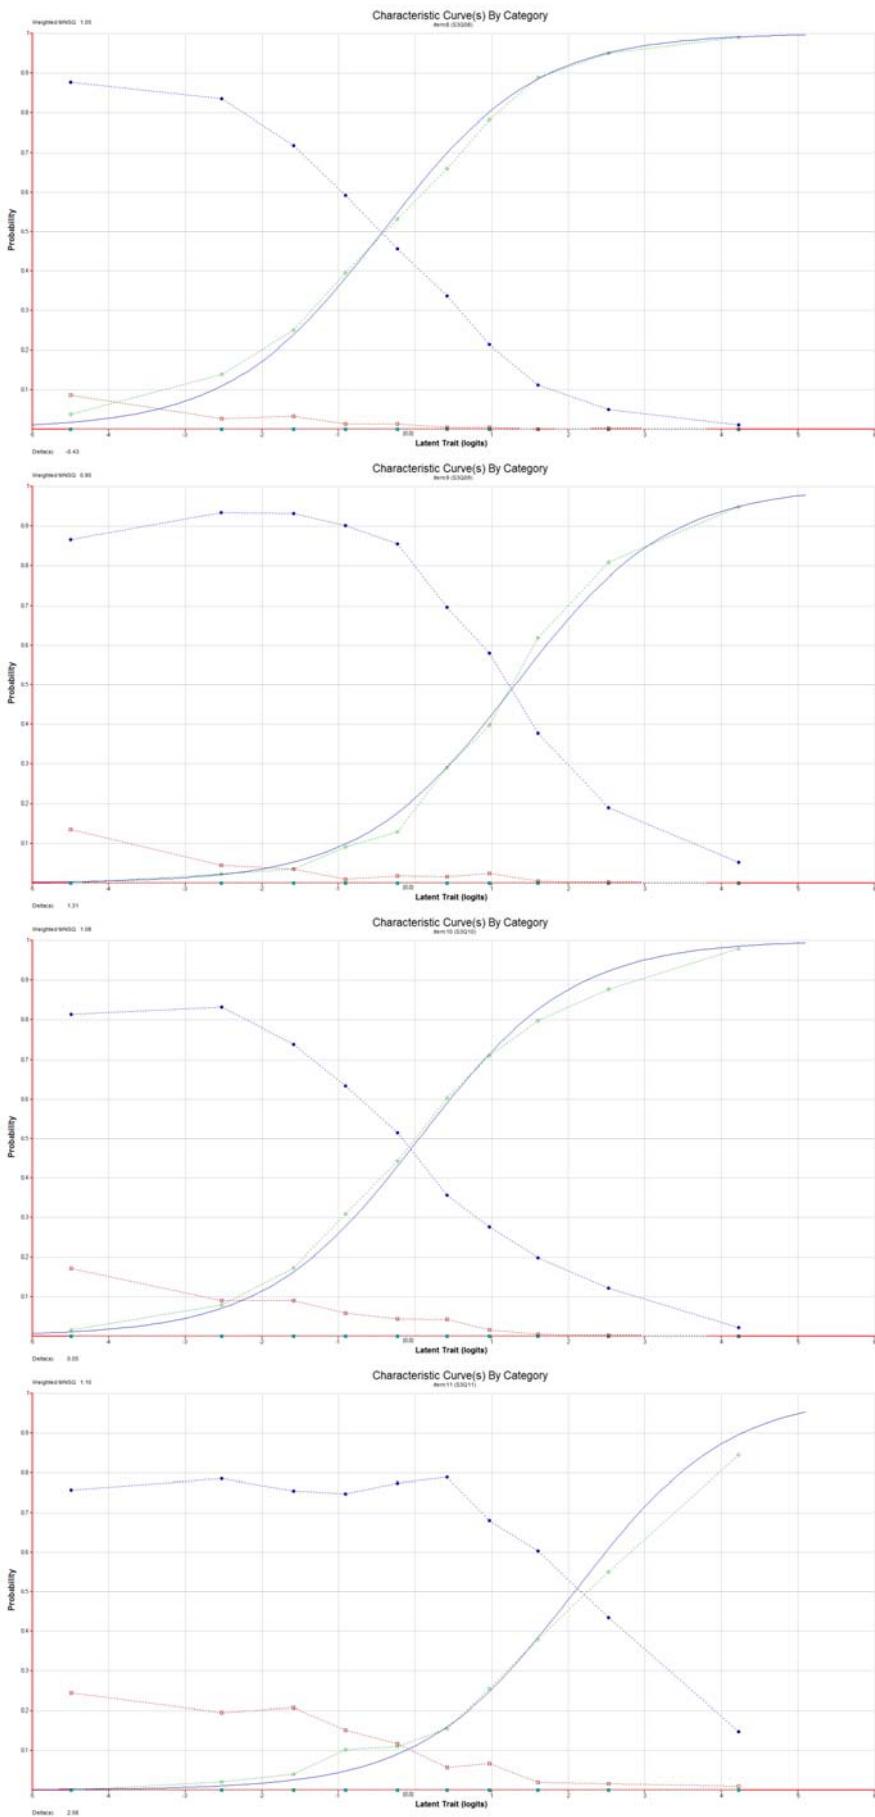

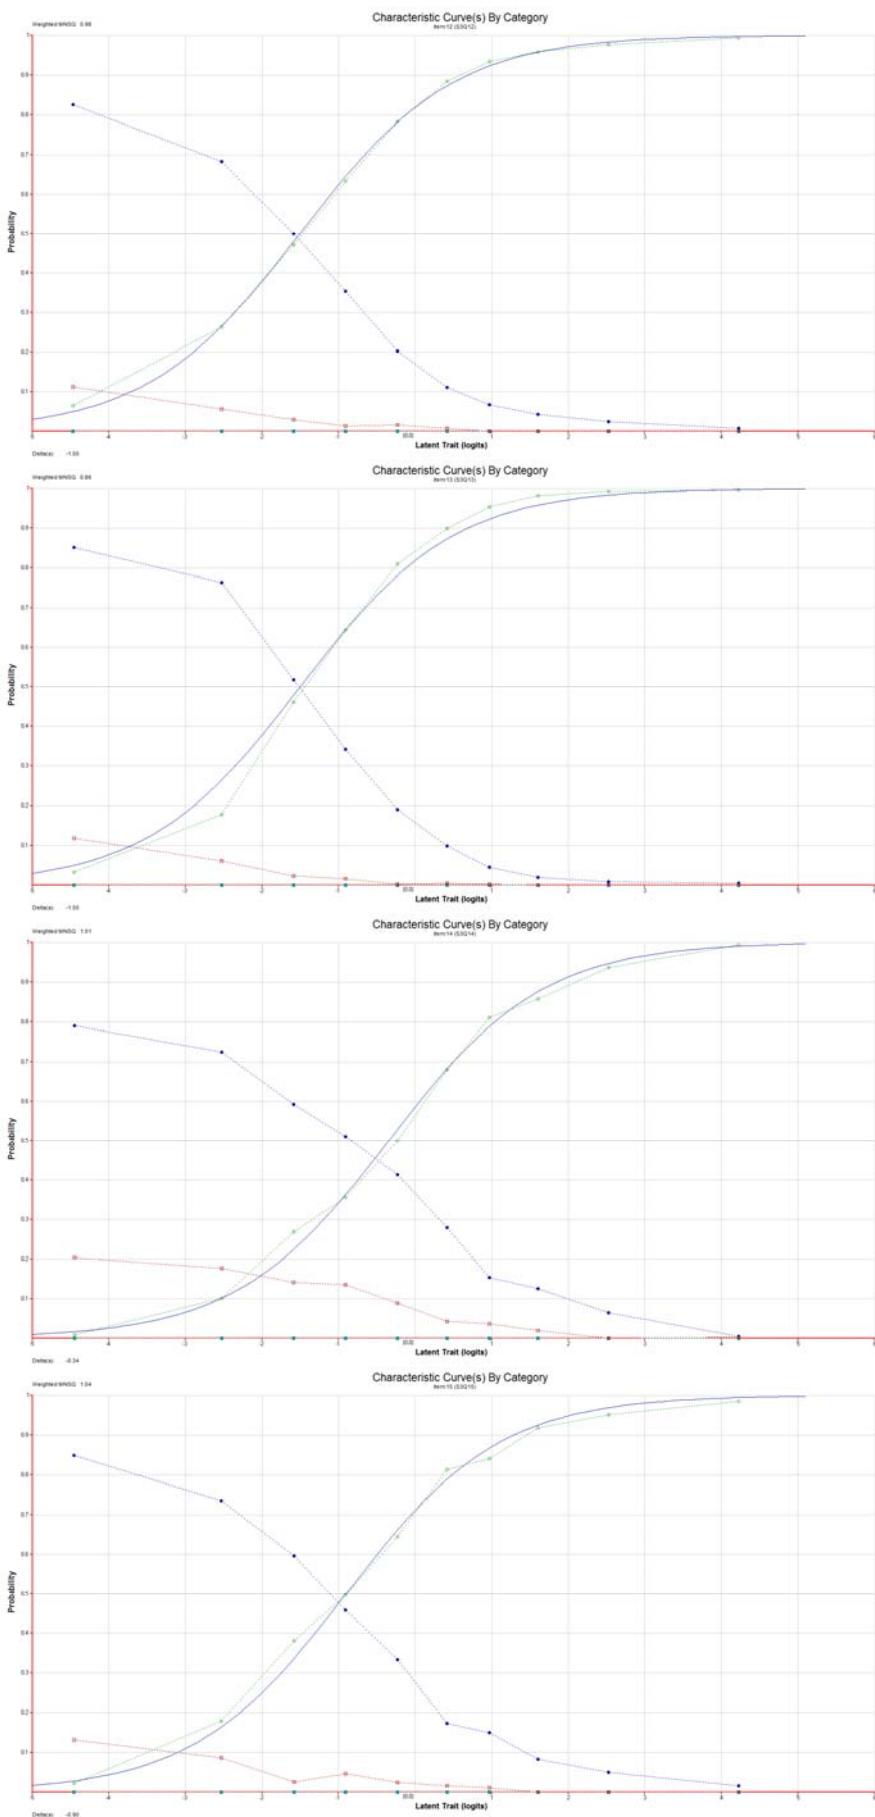

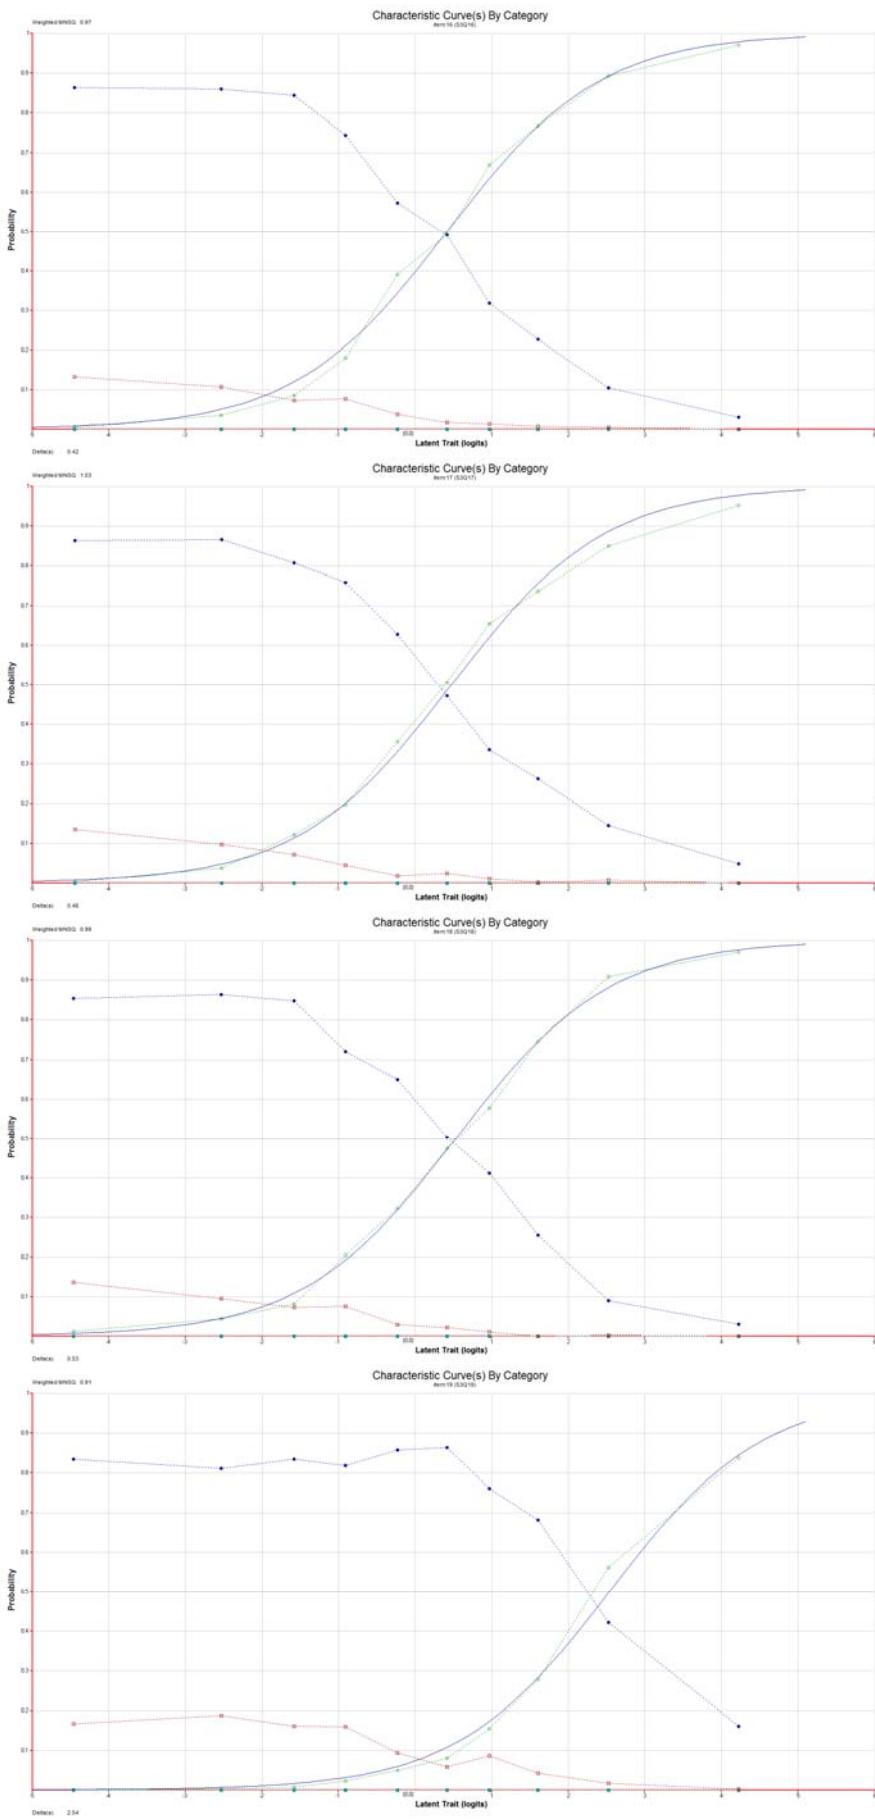

## D.5. Year 3 Spelling

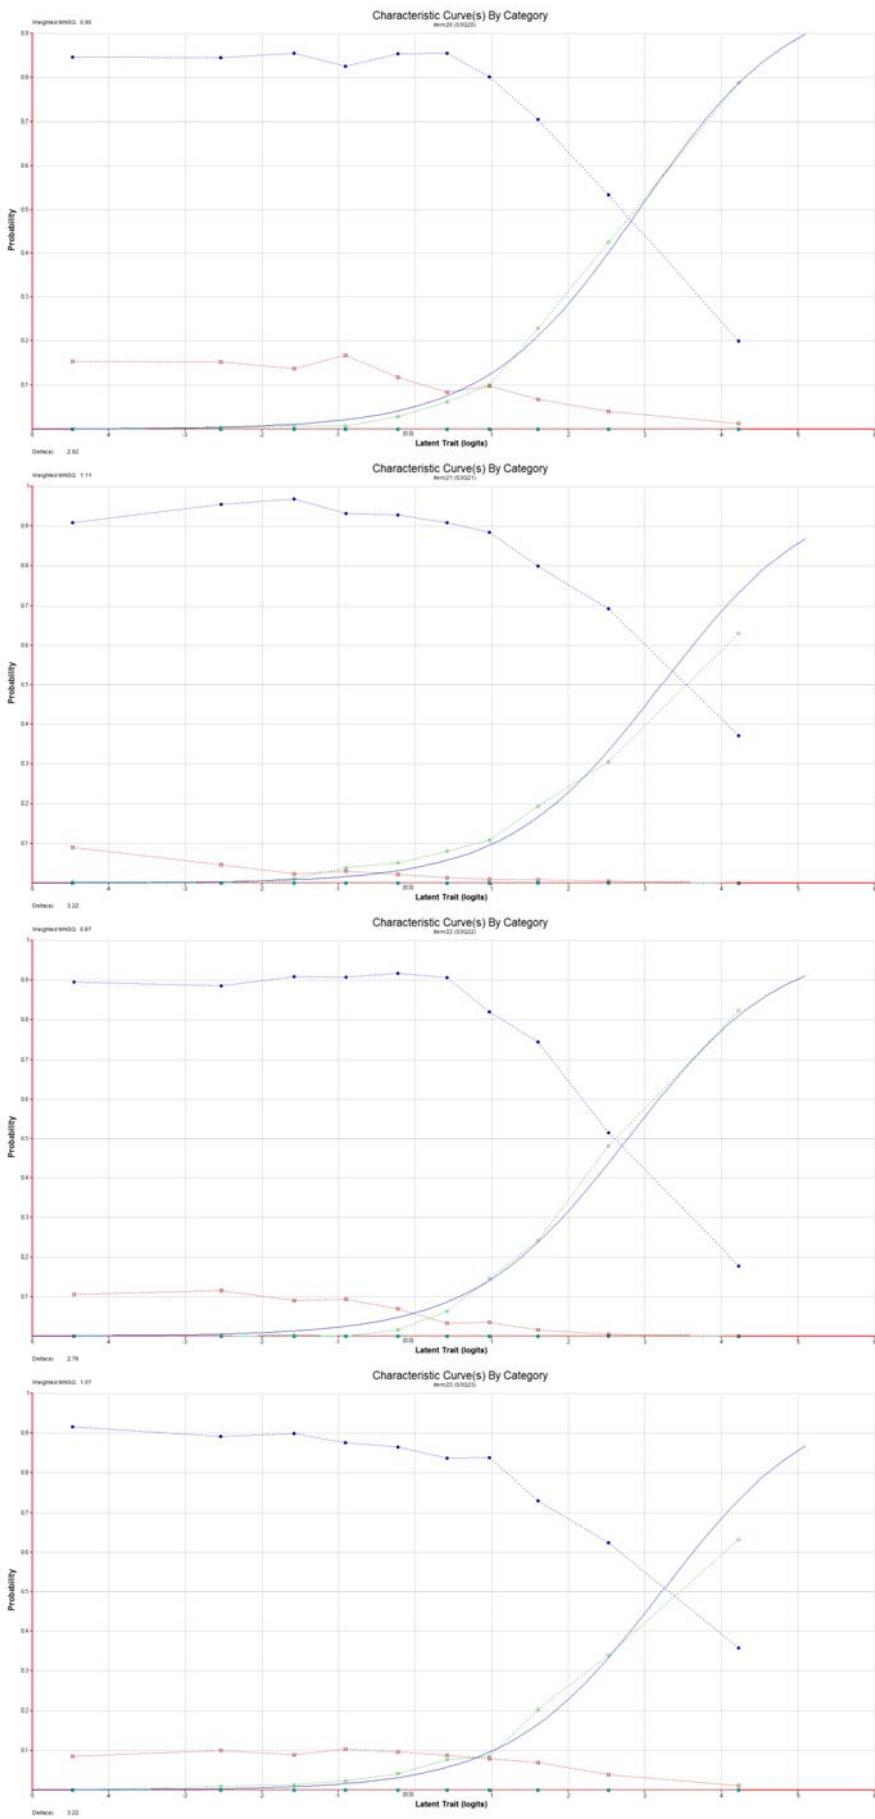

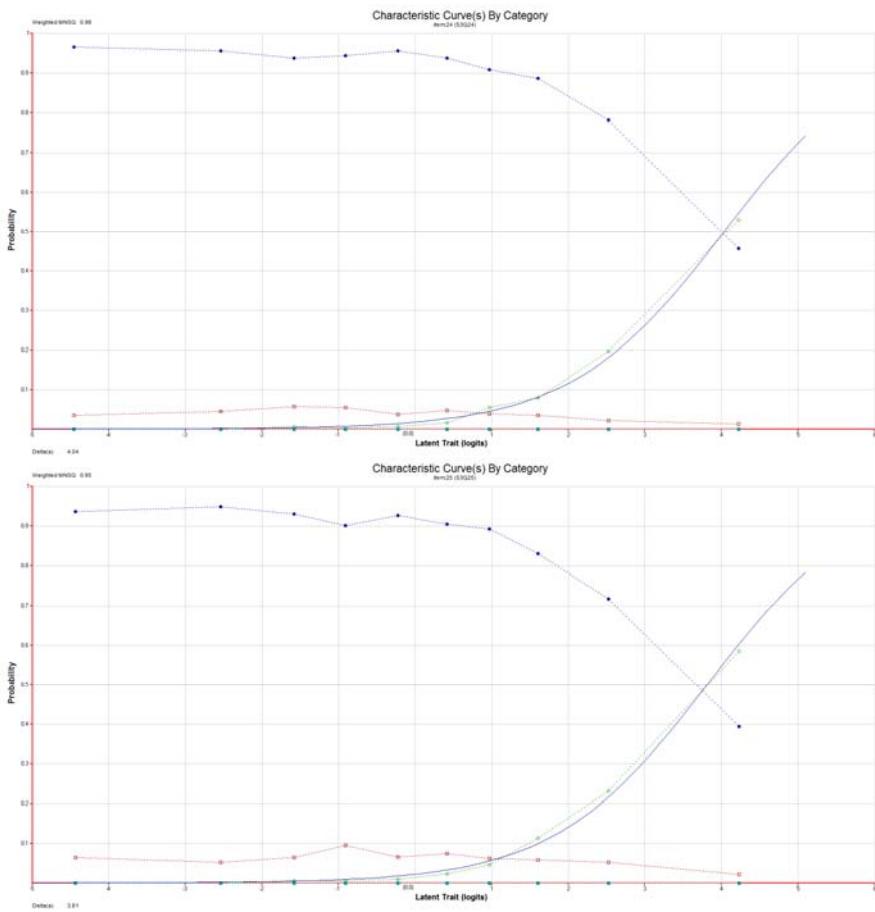

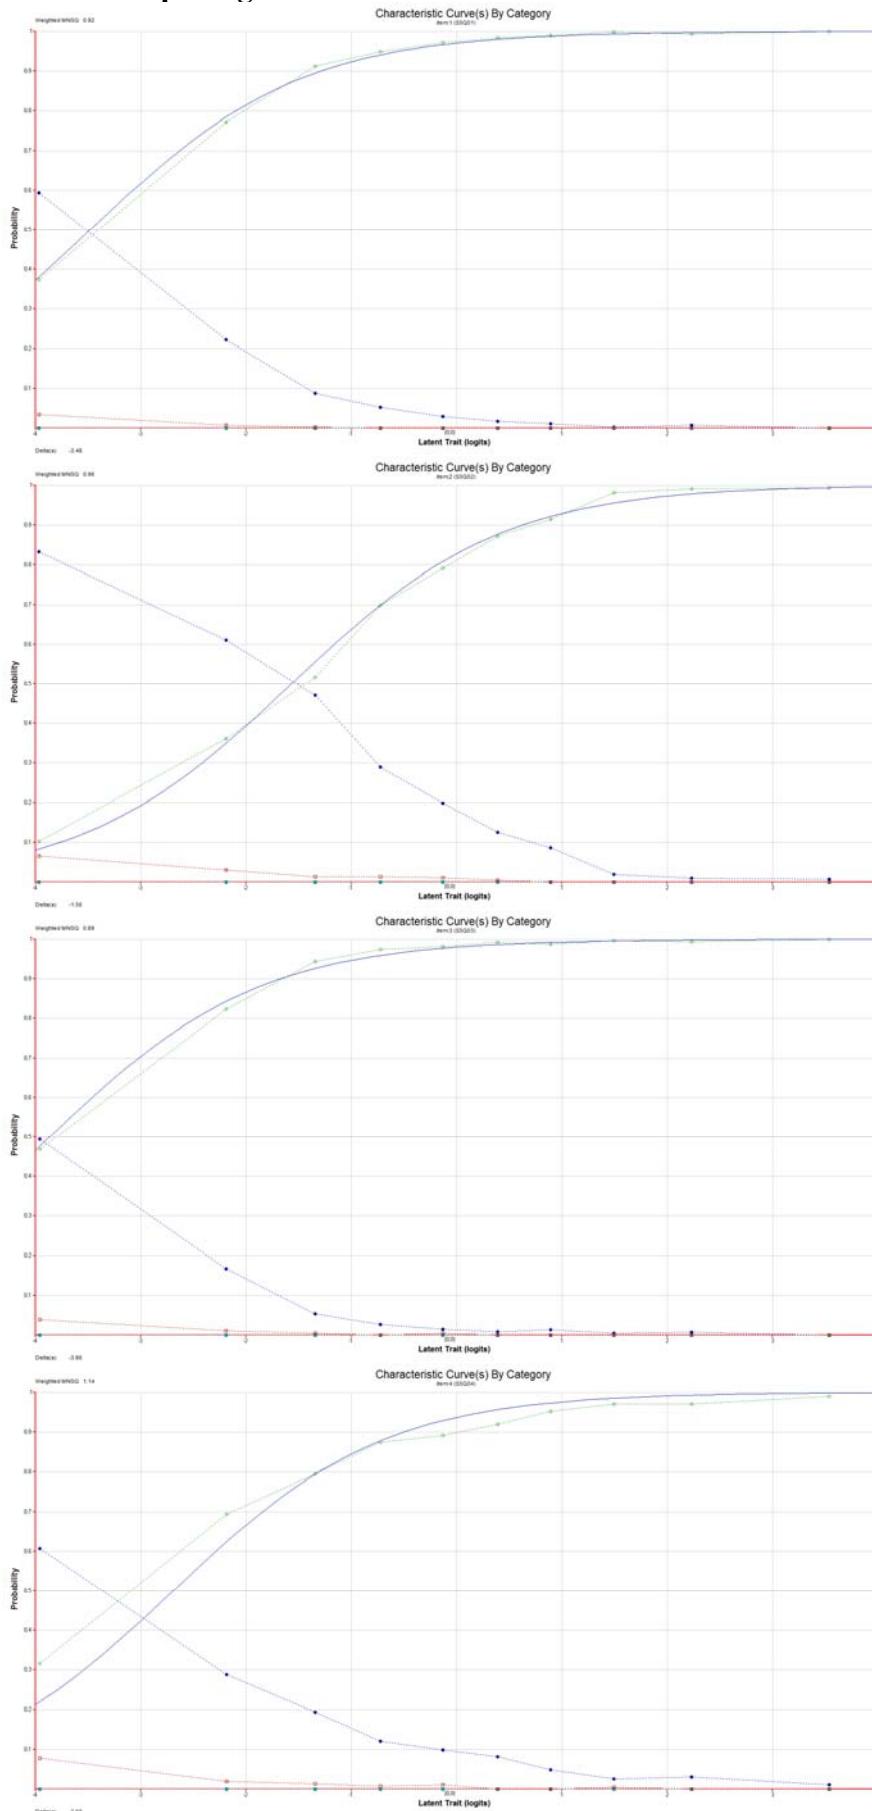

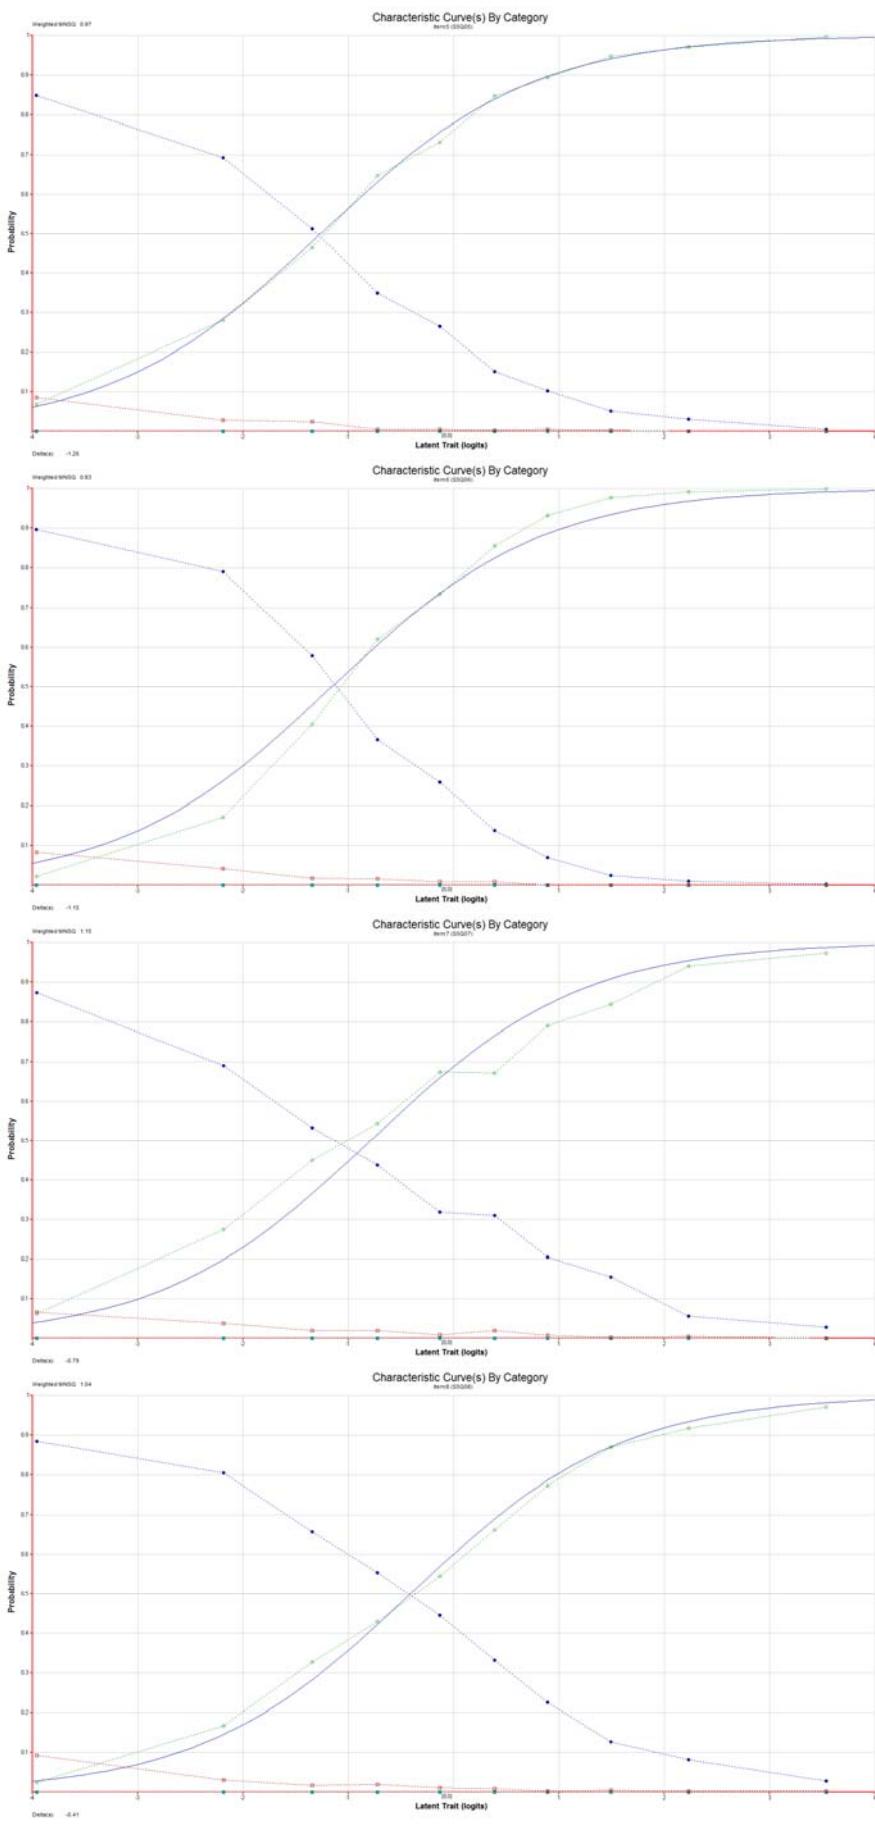

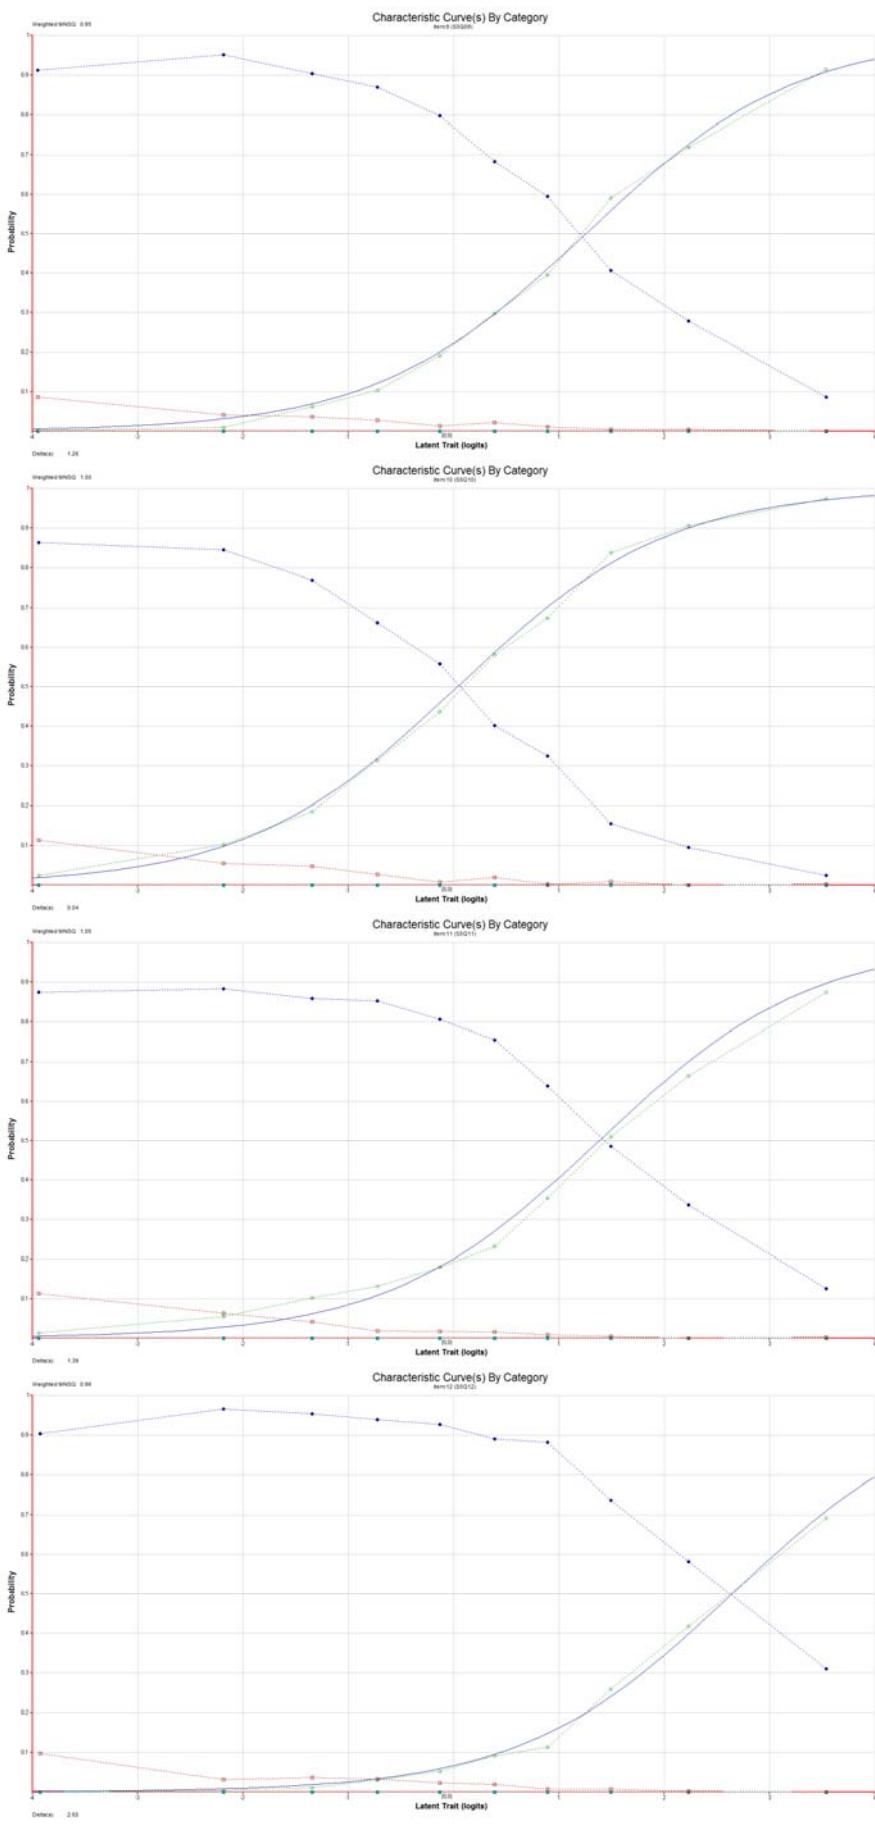

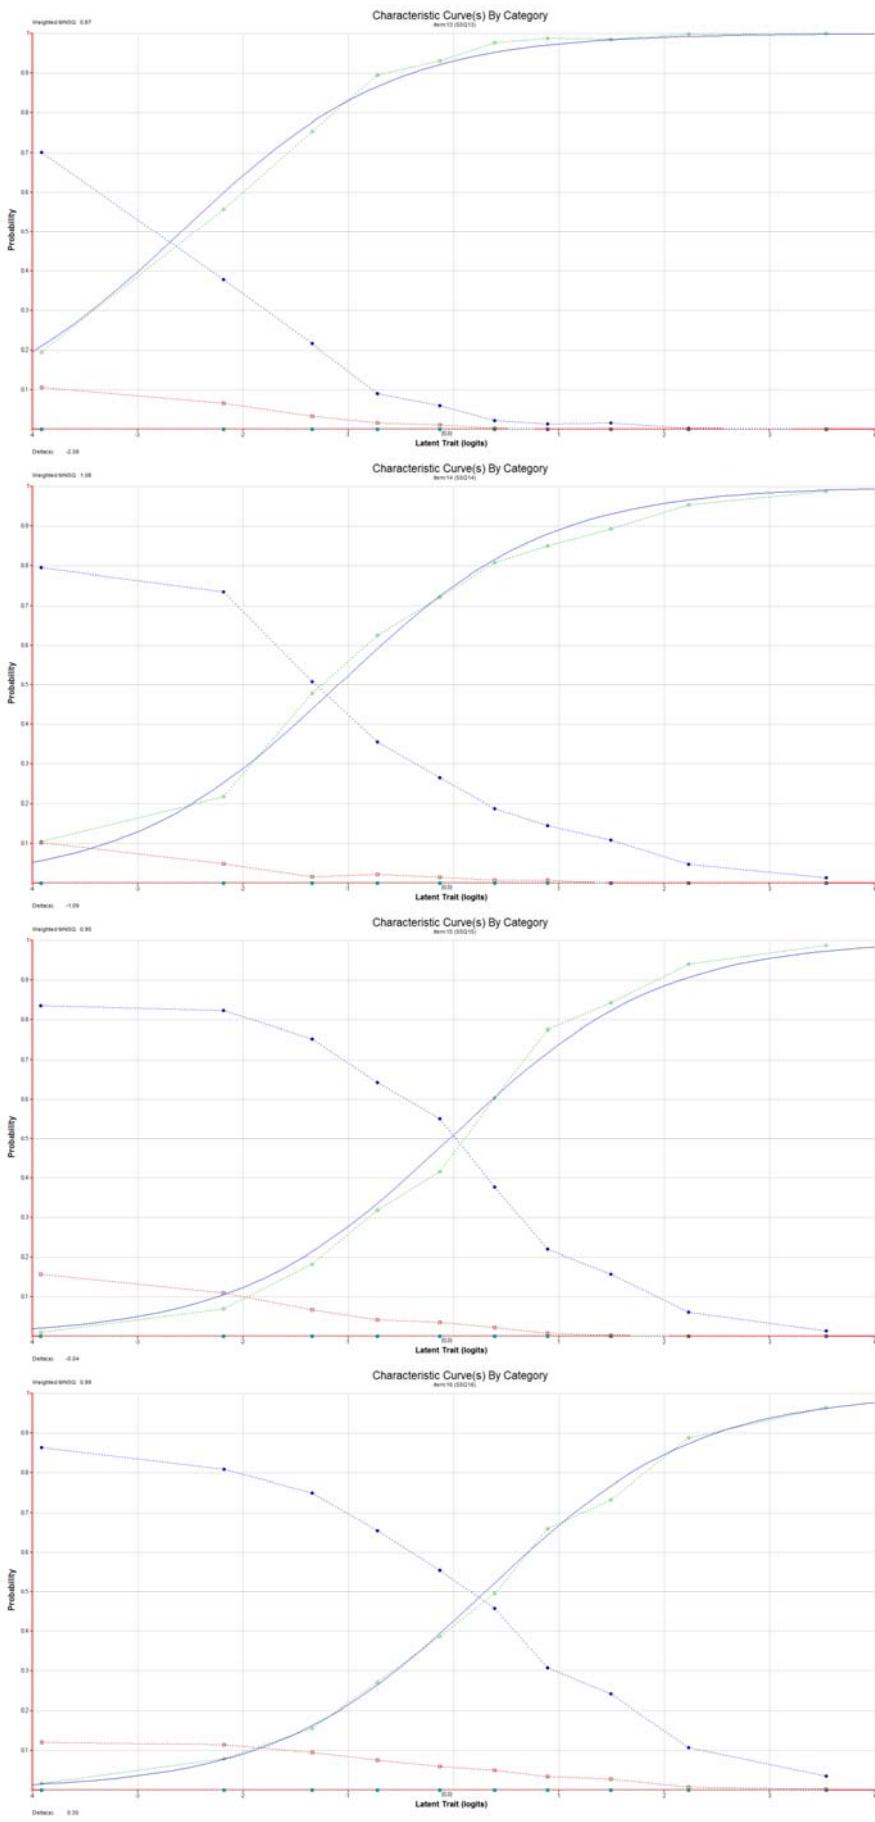

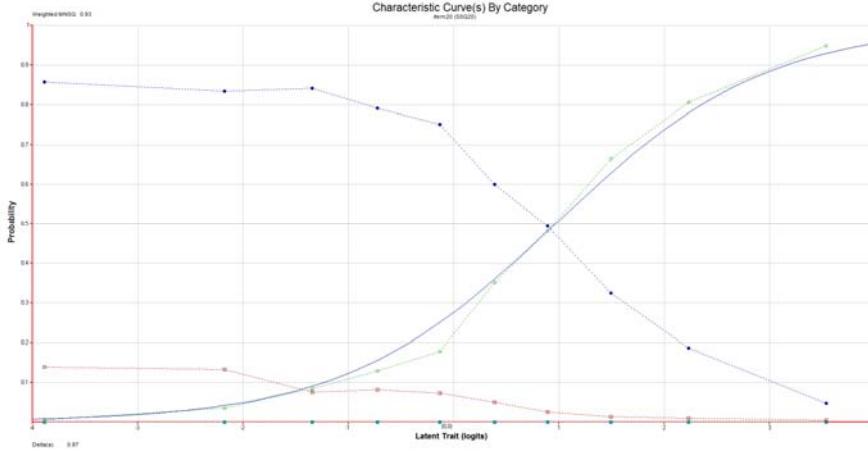

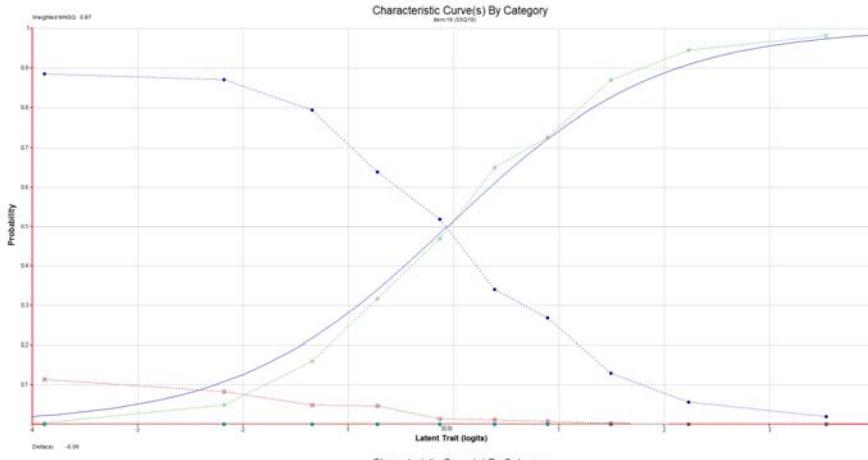

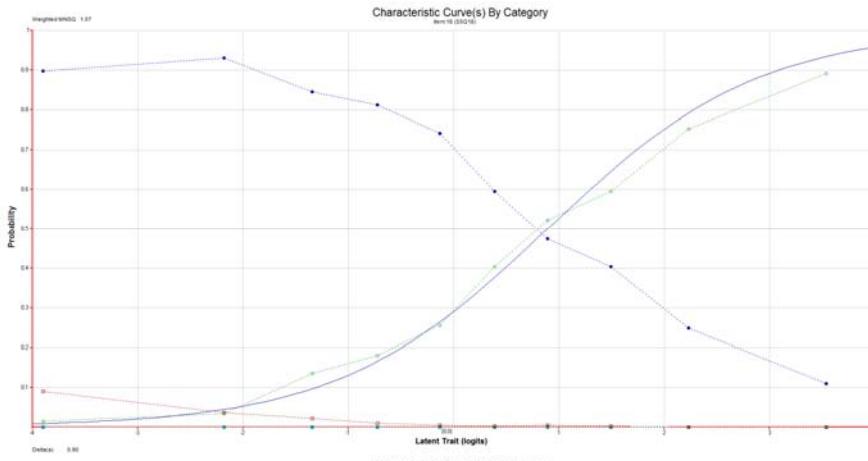

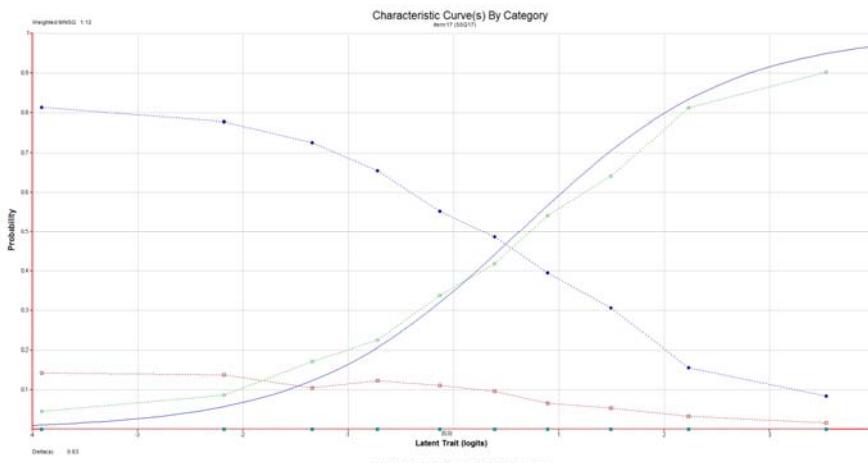

## D.6. Year 5 Spelling

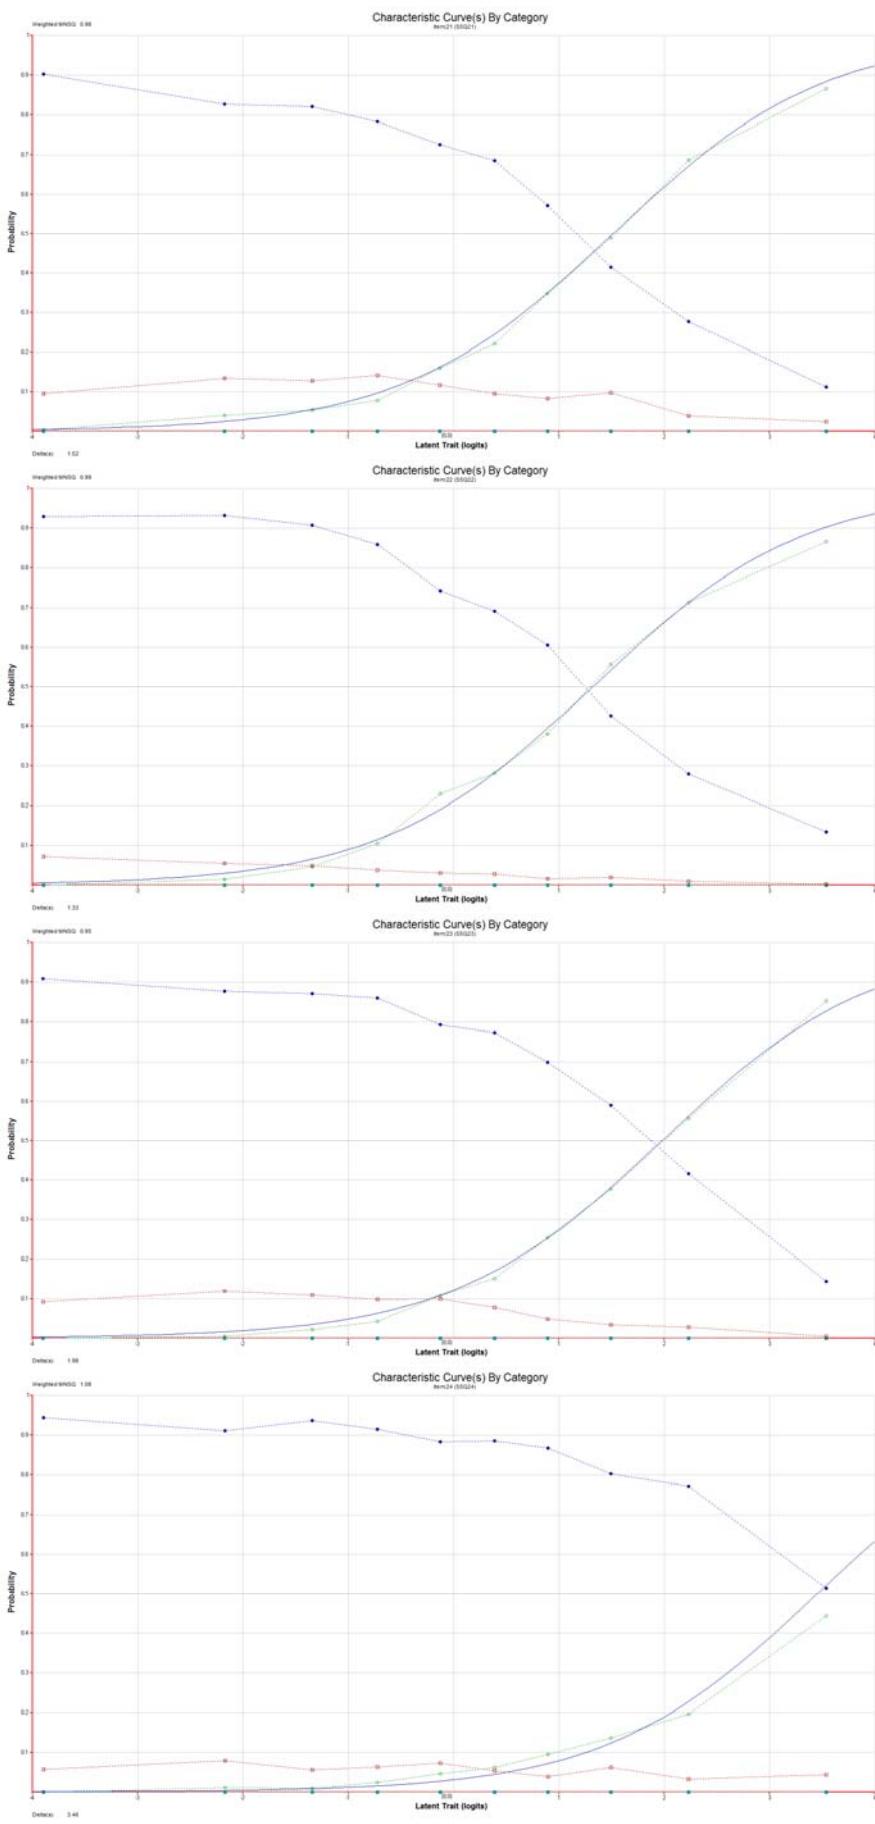

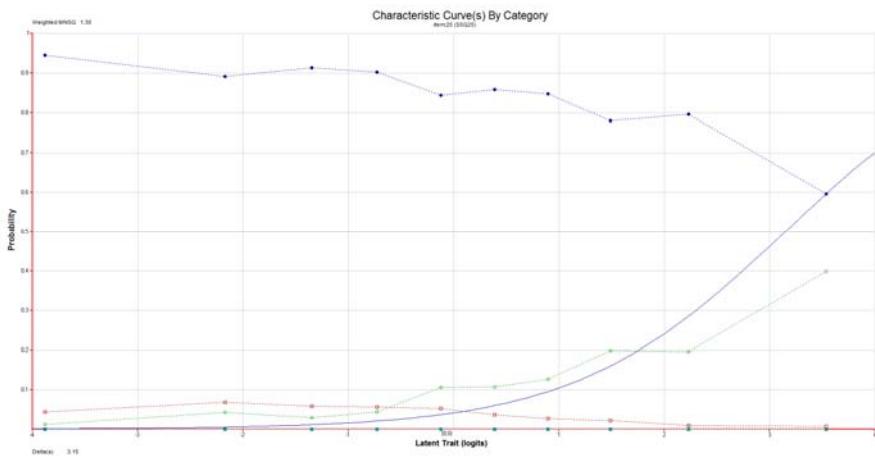

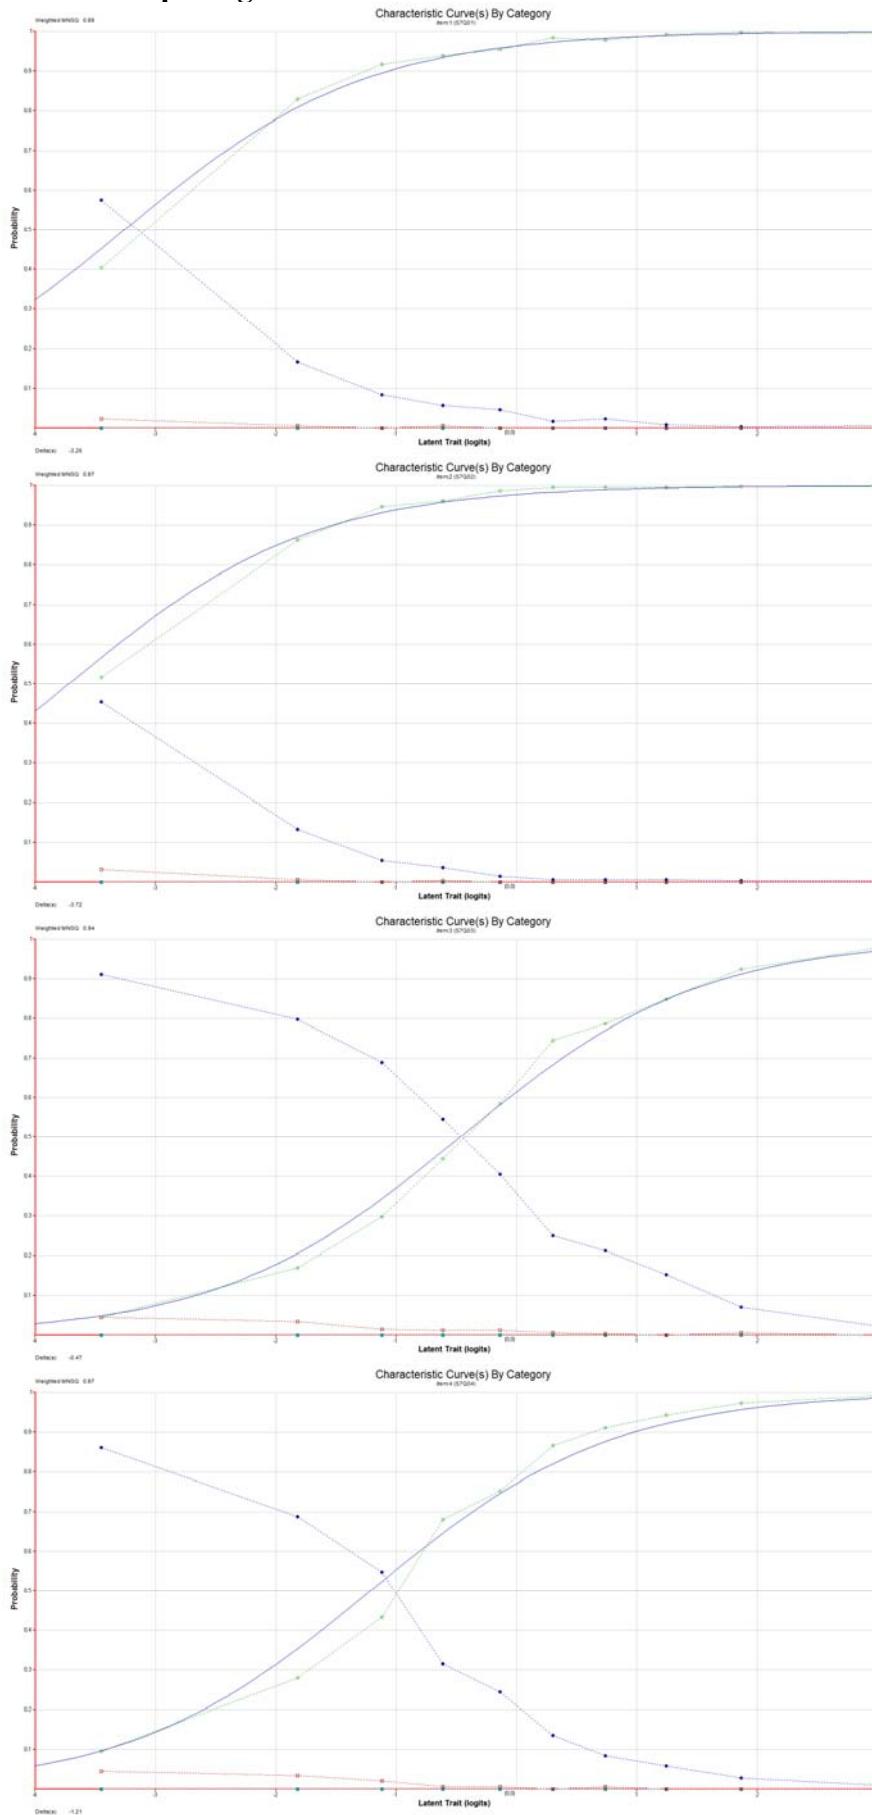

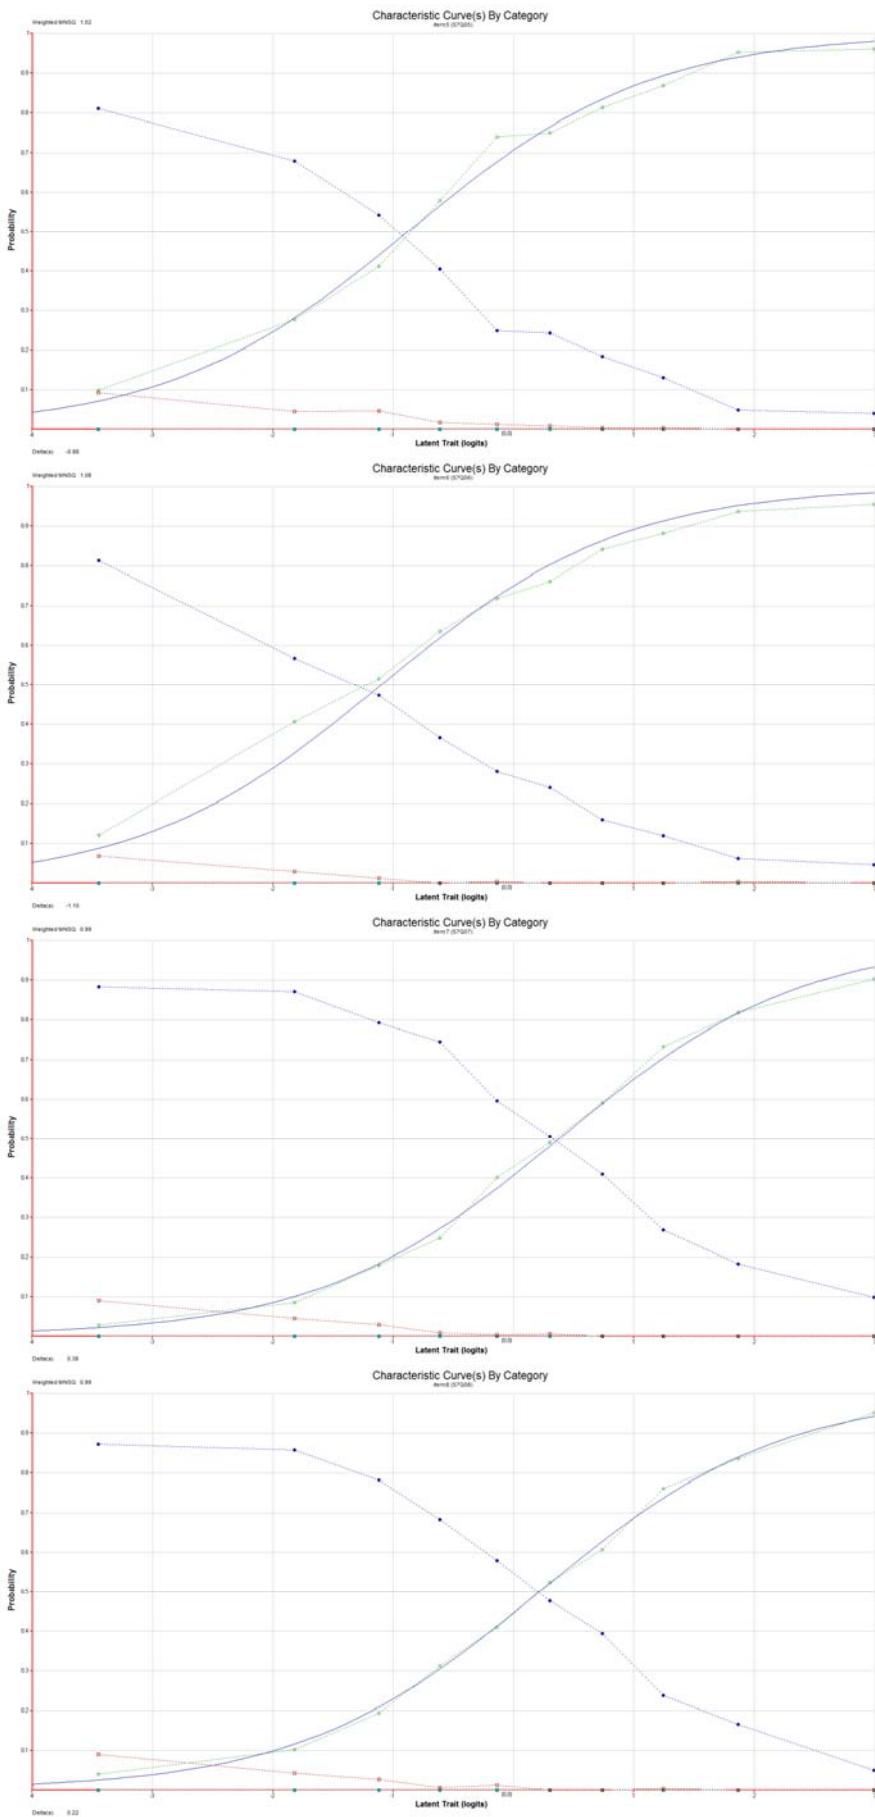

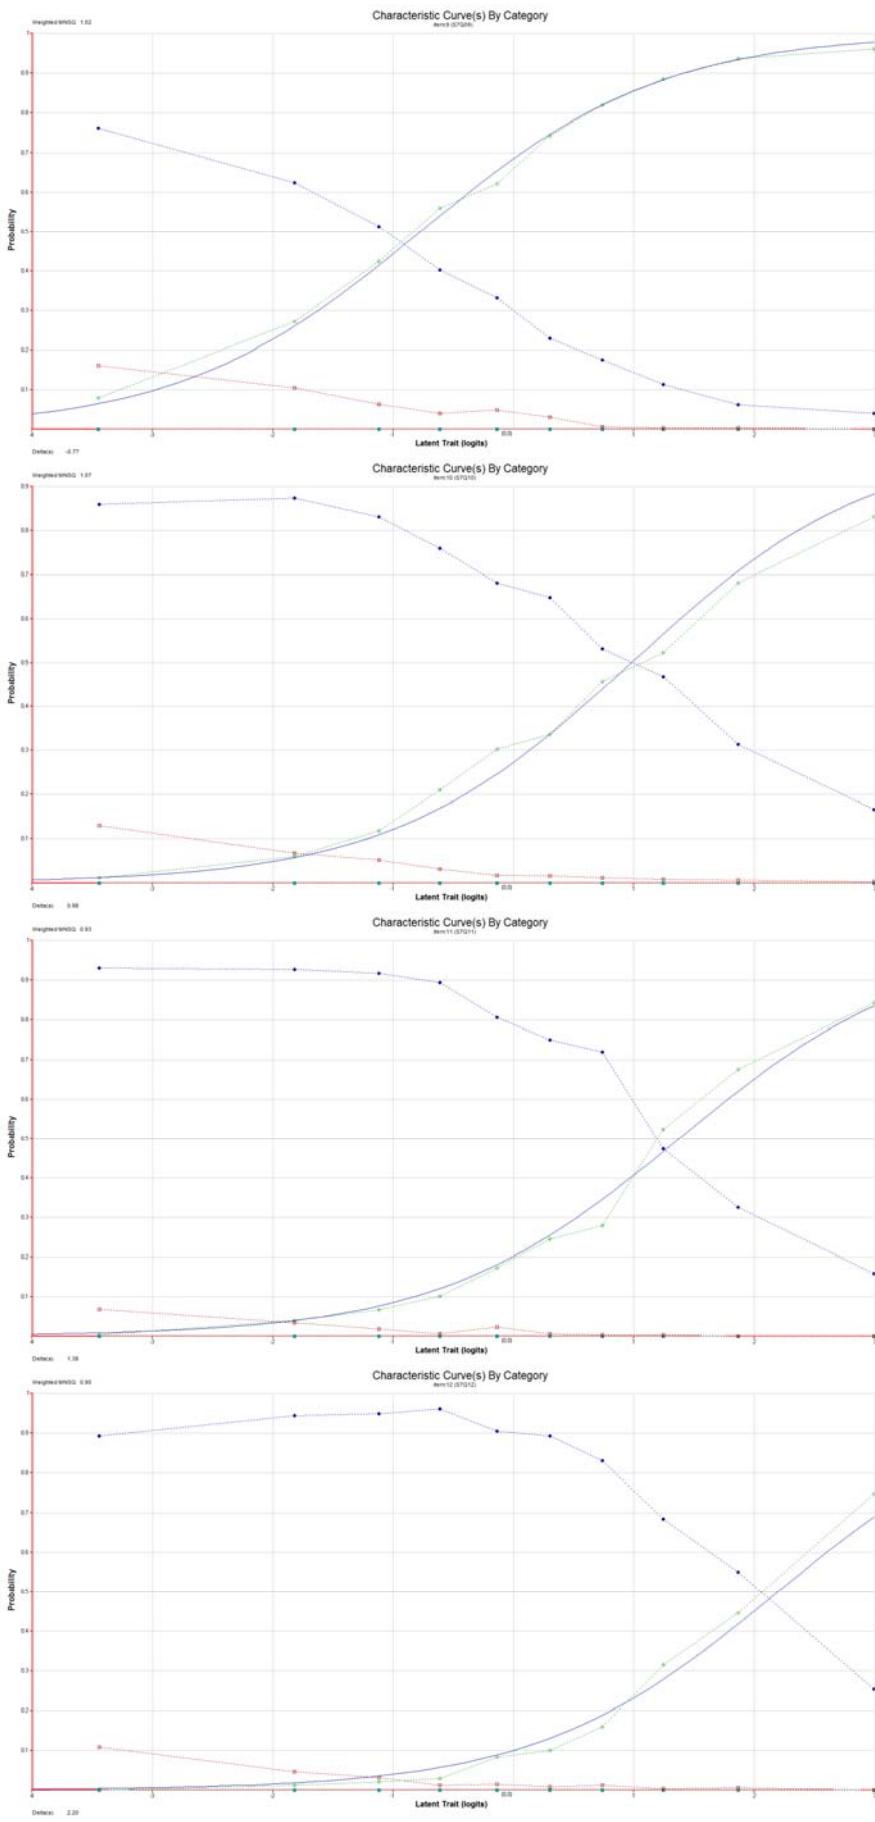

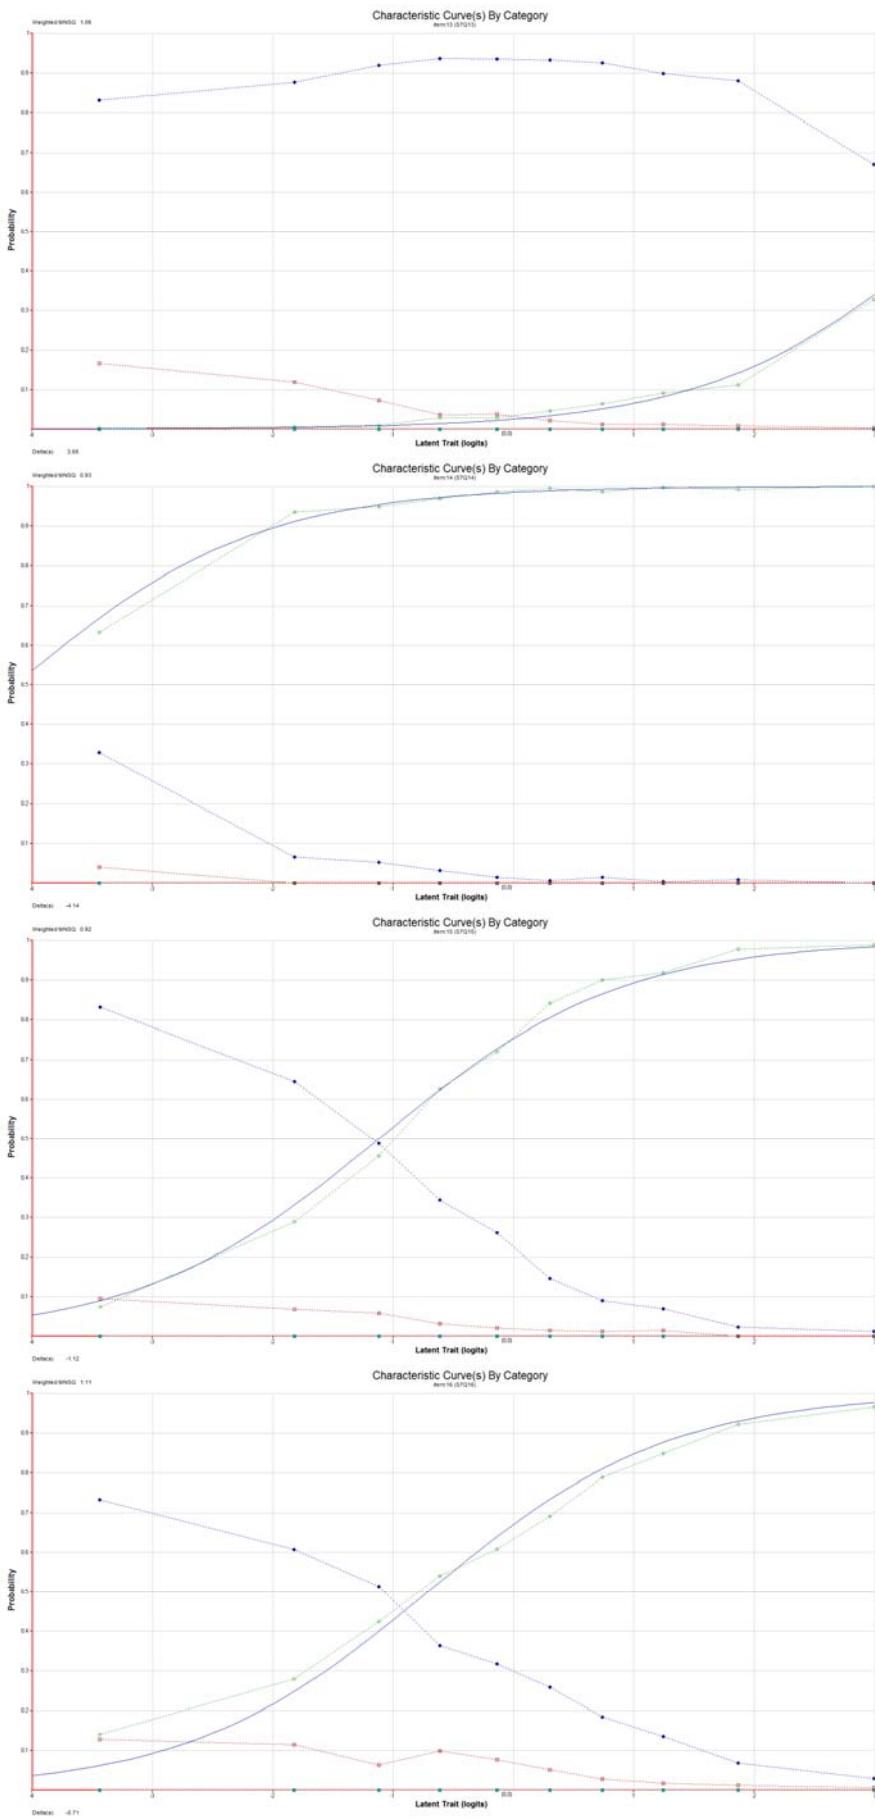

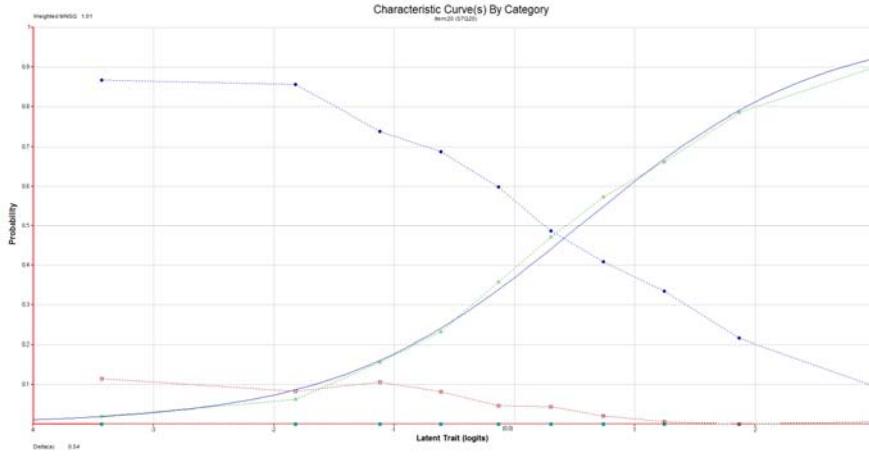

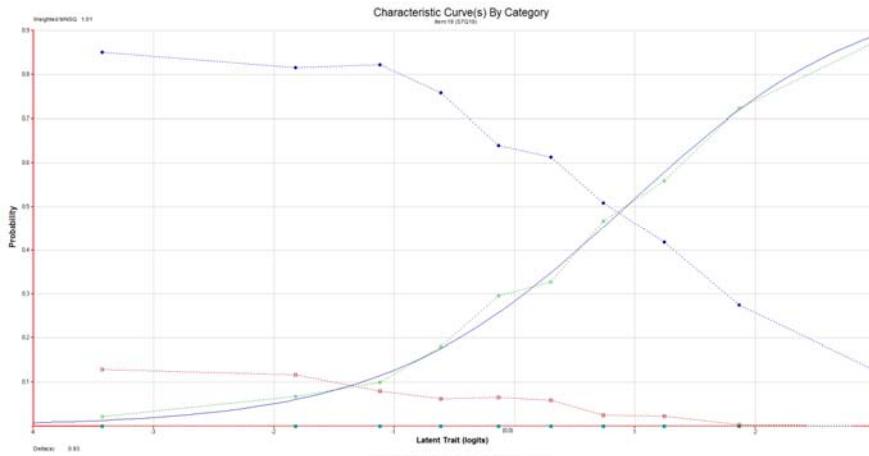

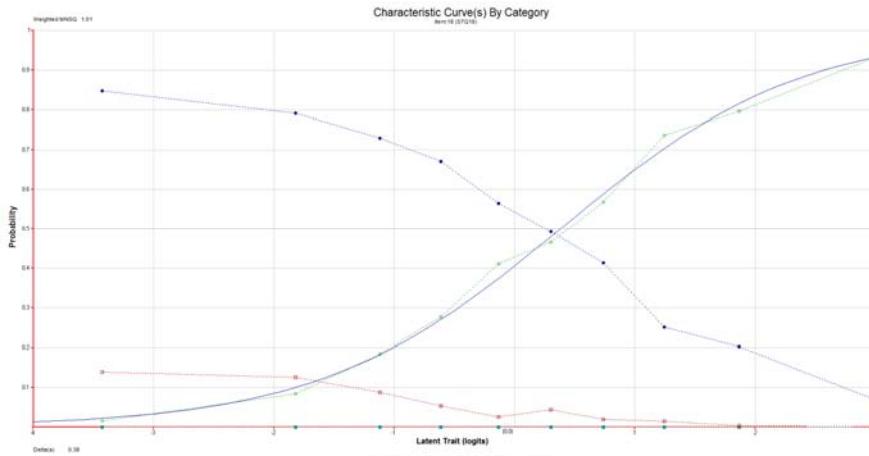

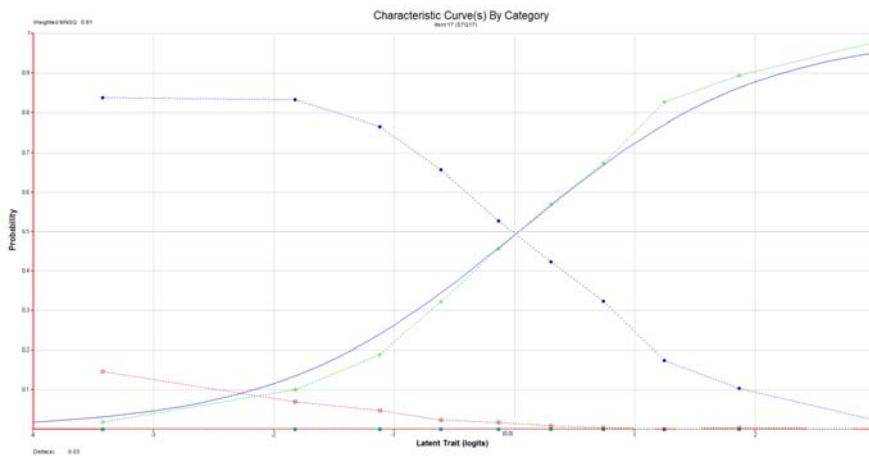

## D.7. Year 7 Spelling

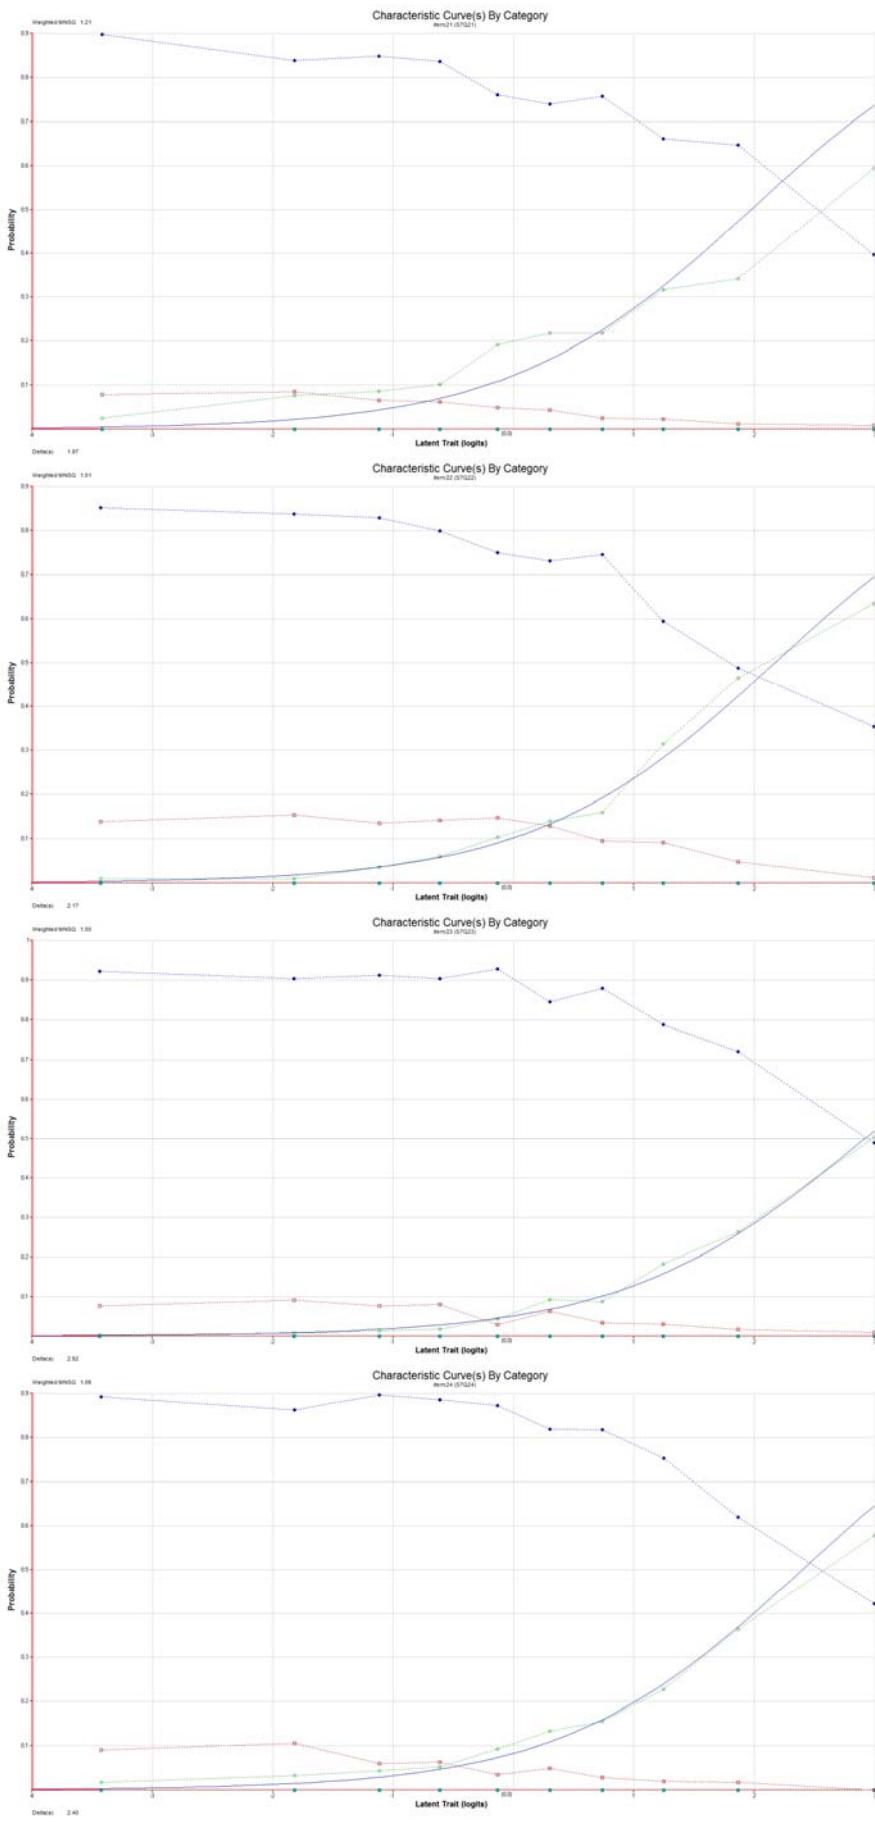

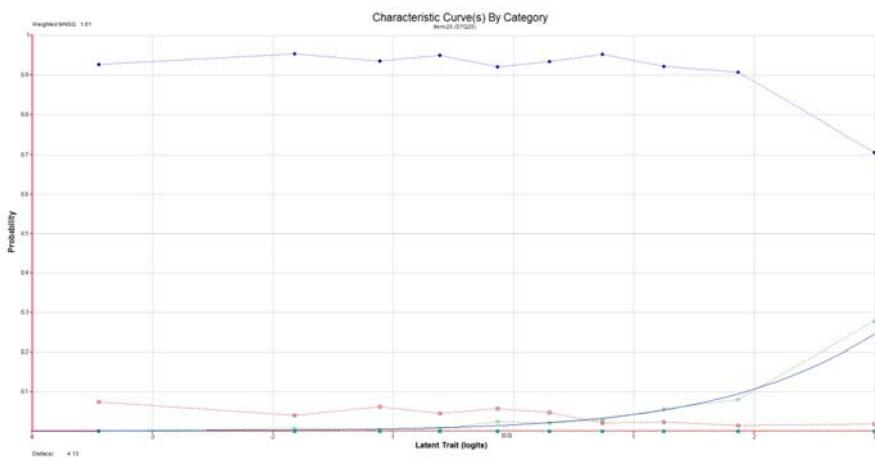

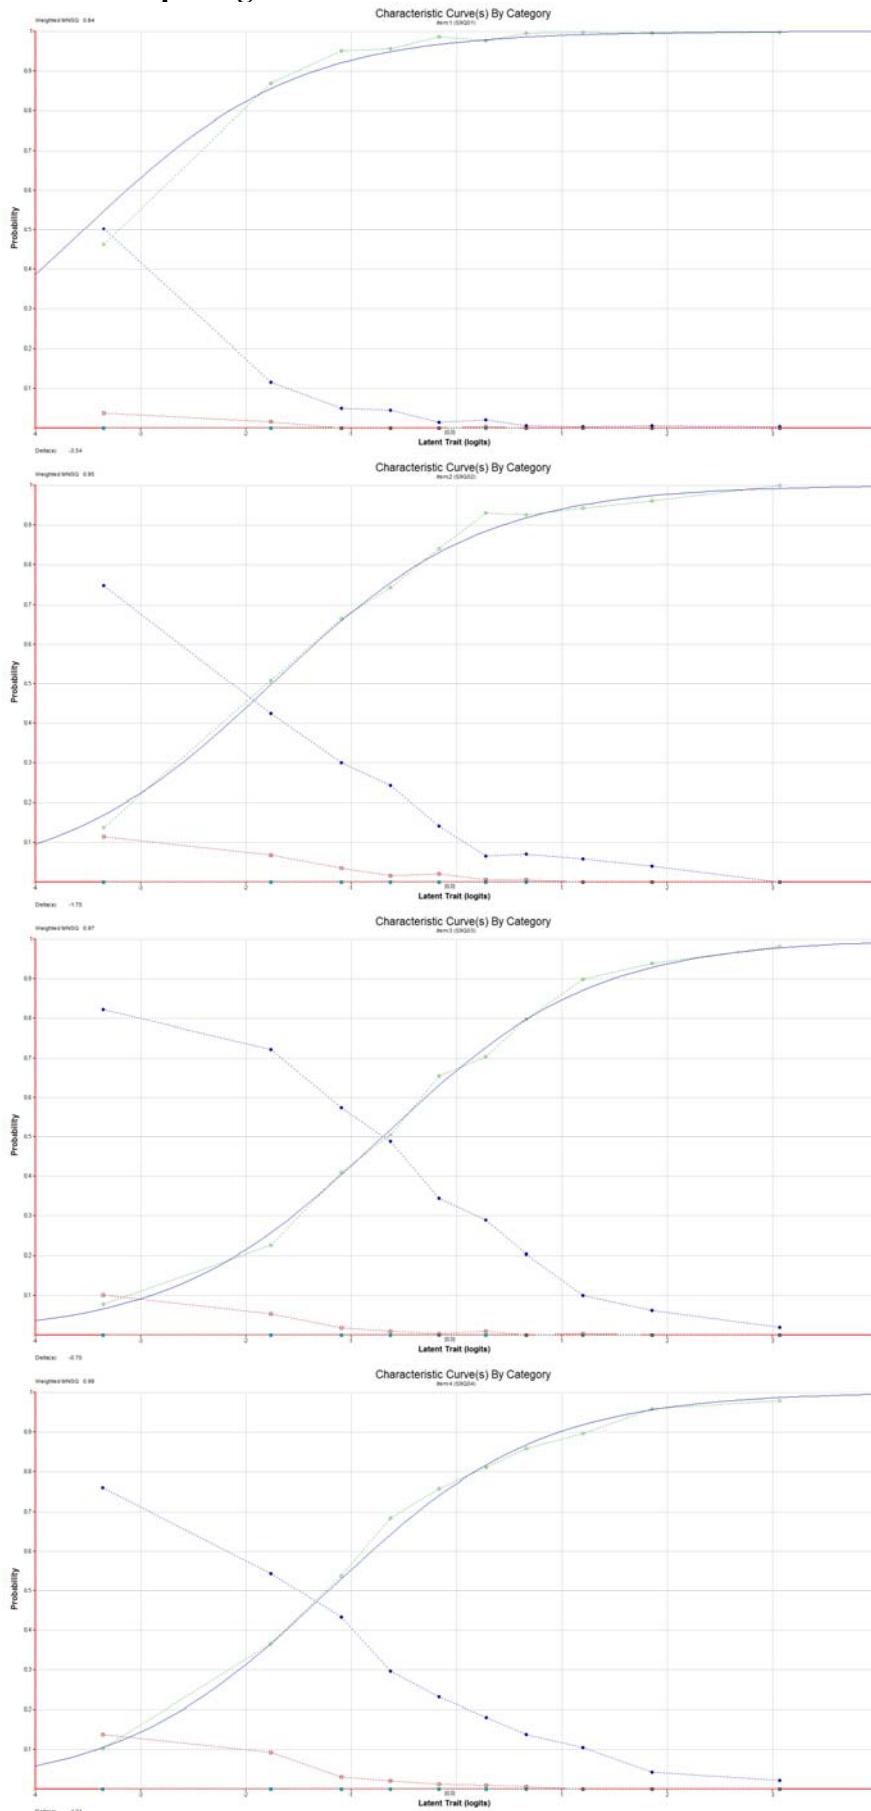

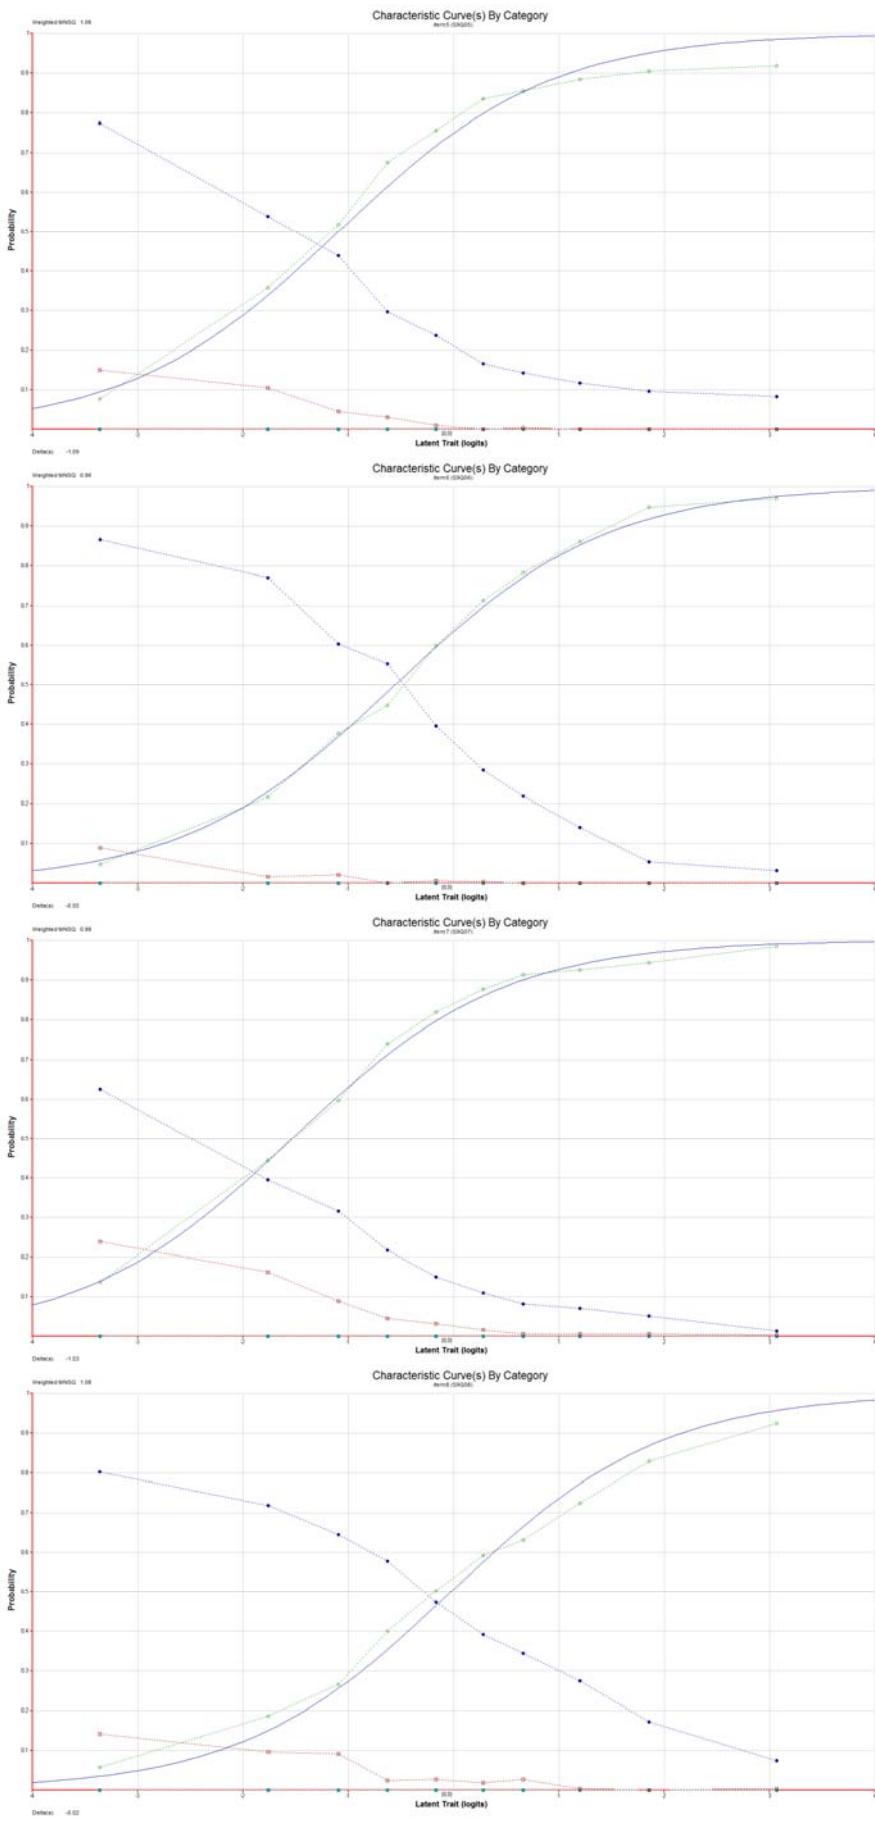

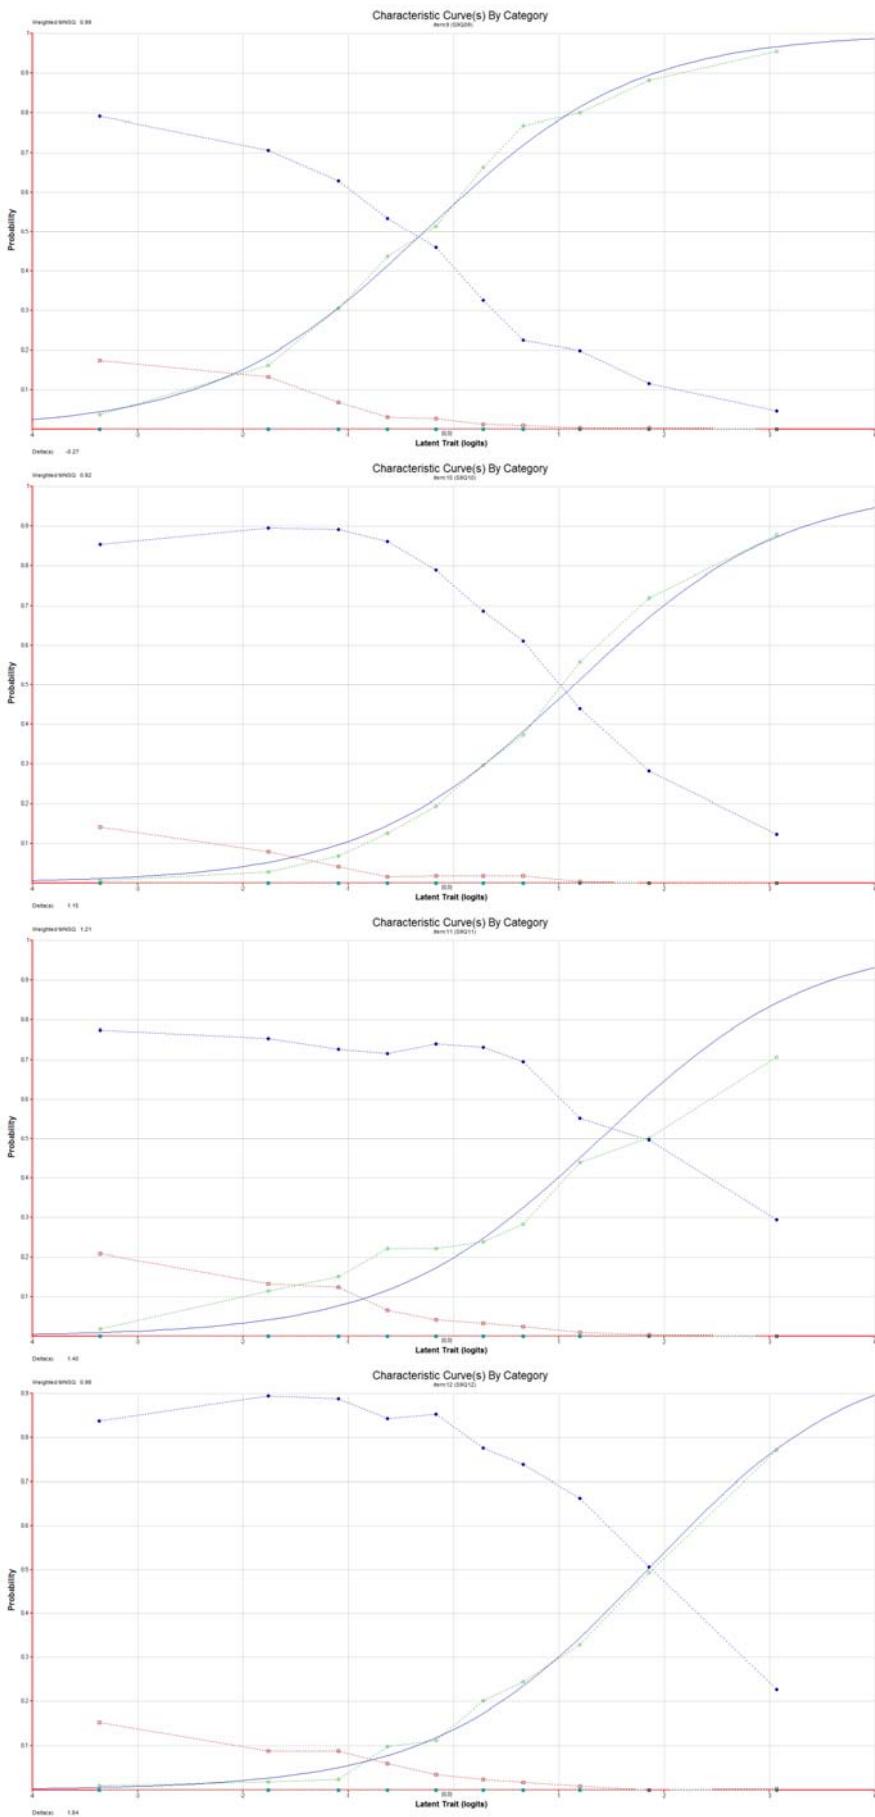

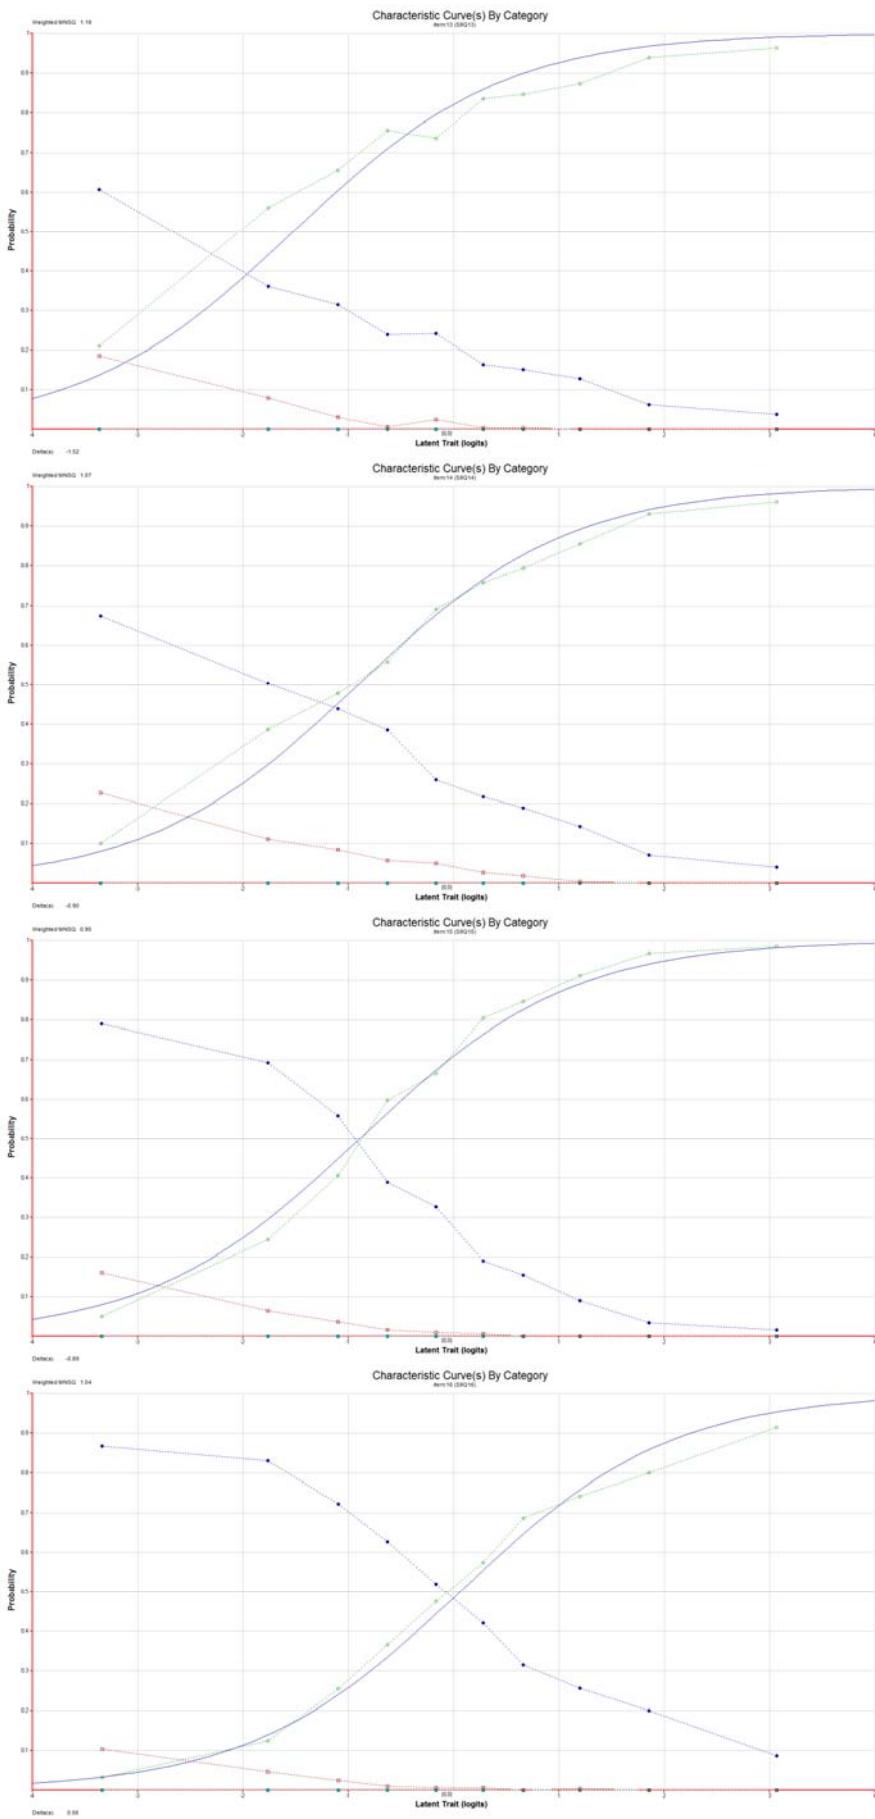

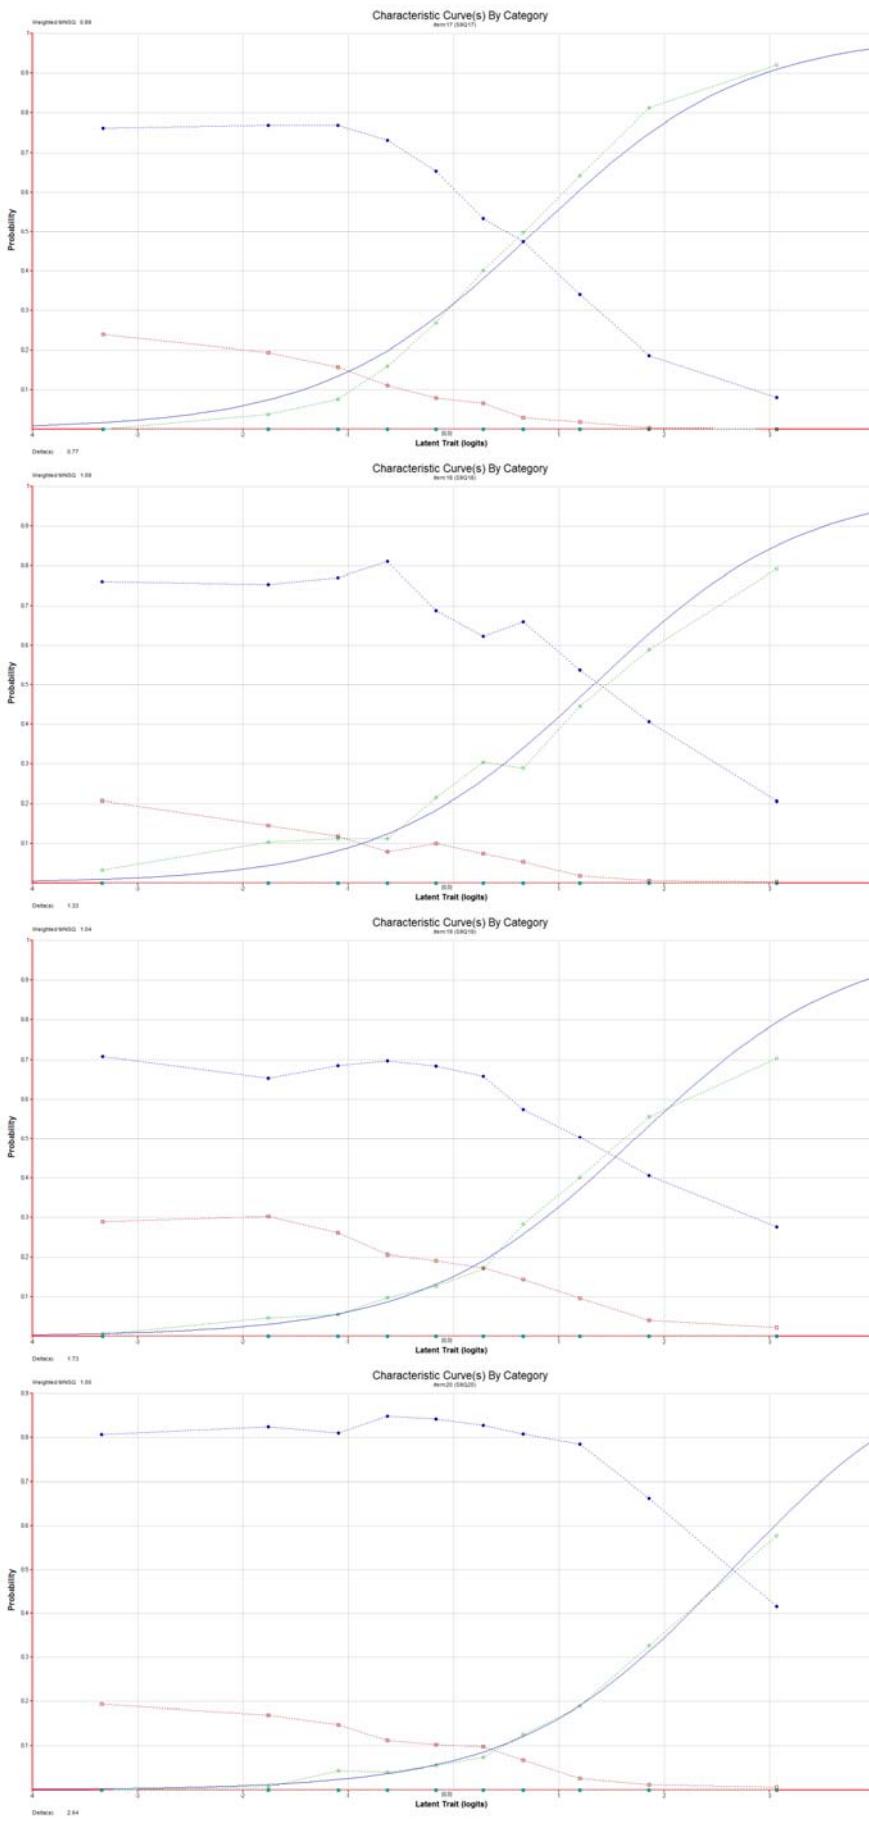

## D.8. Year 9 Spelling

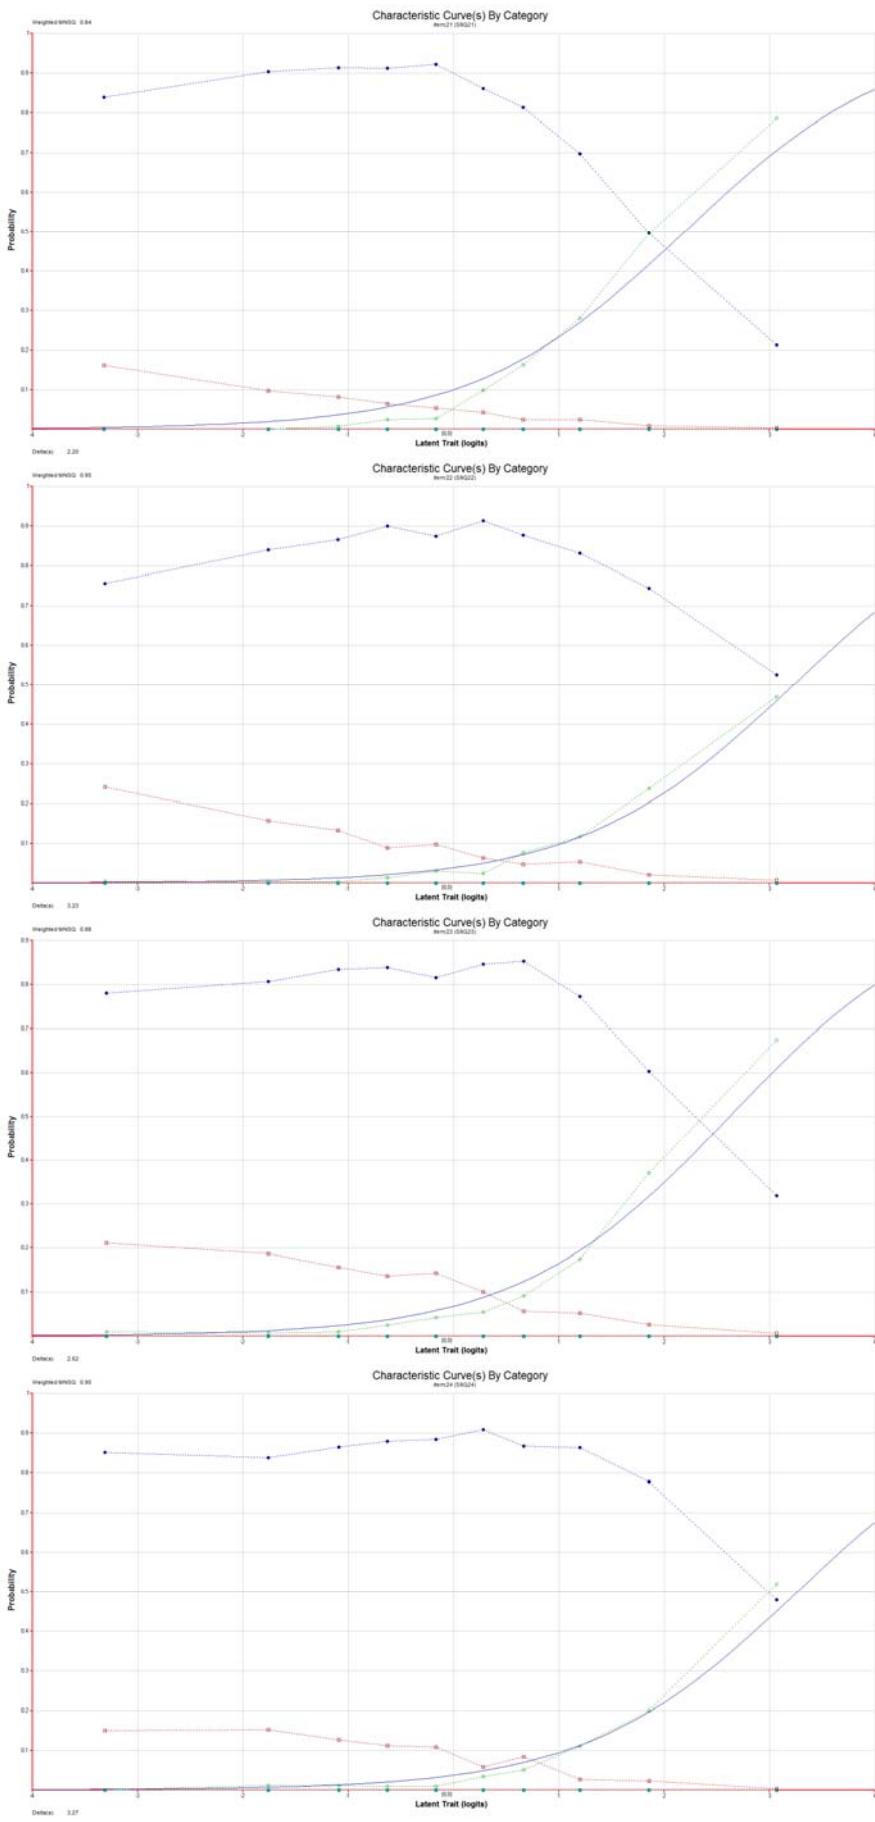

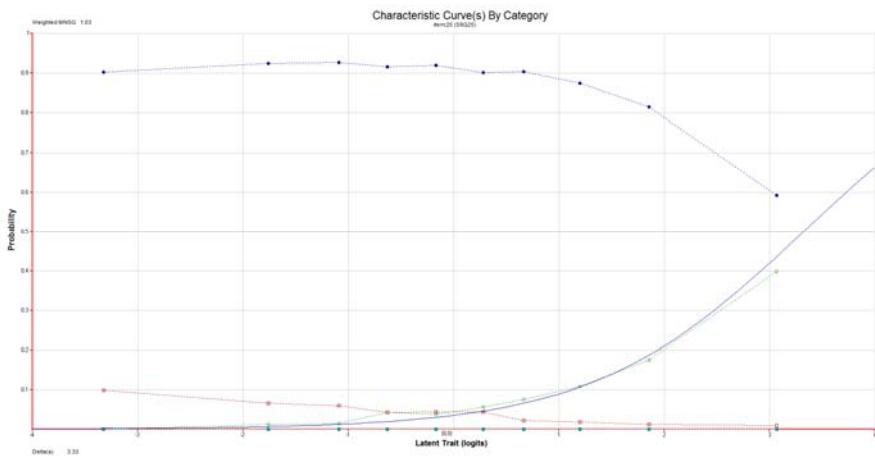

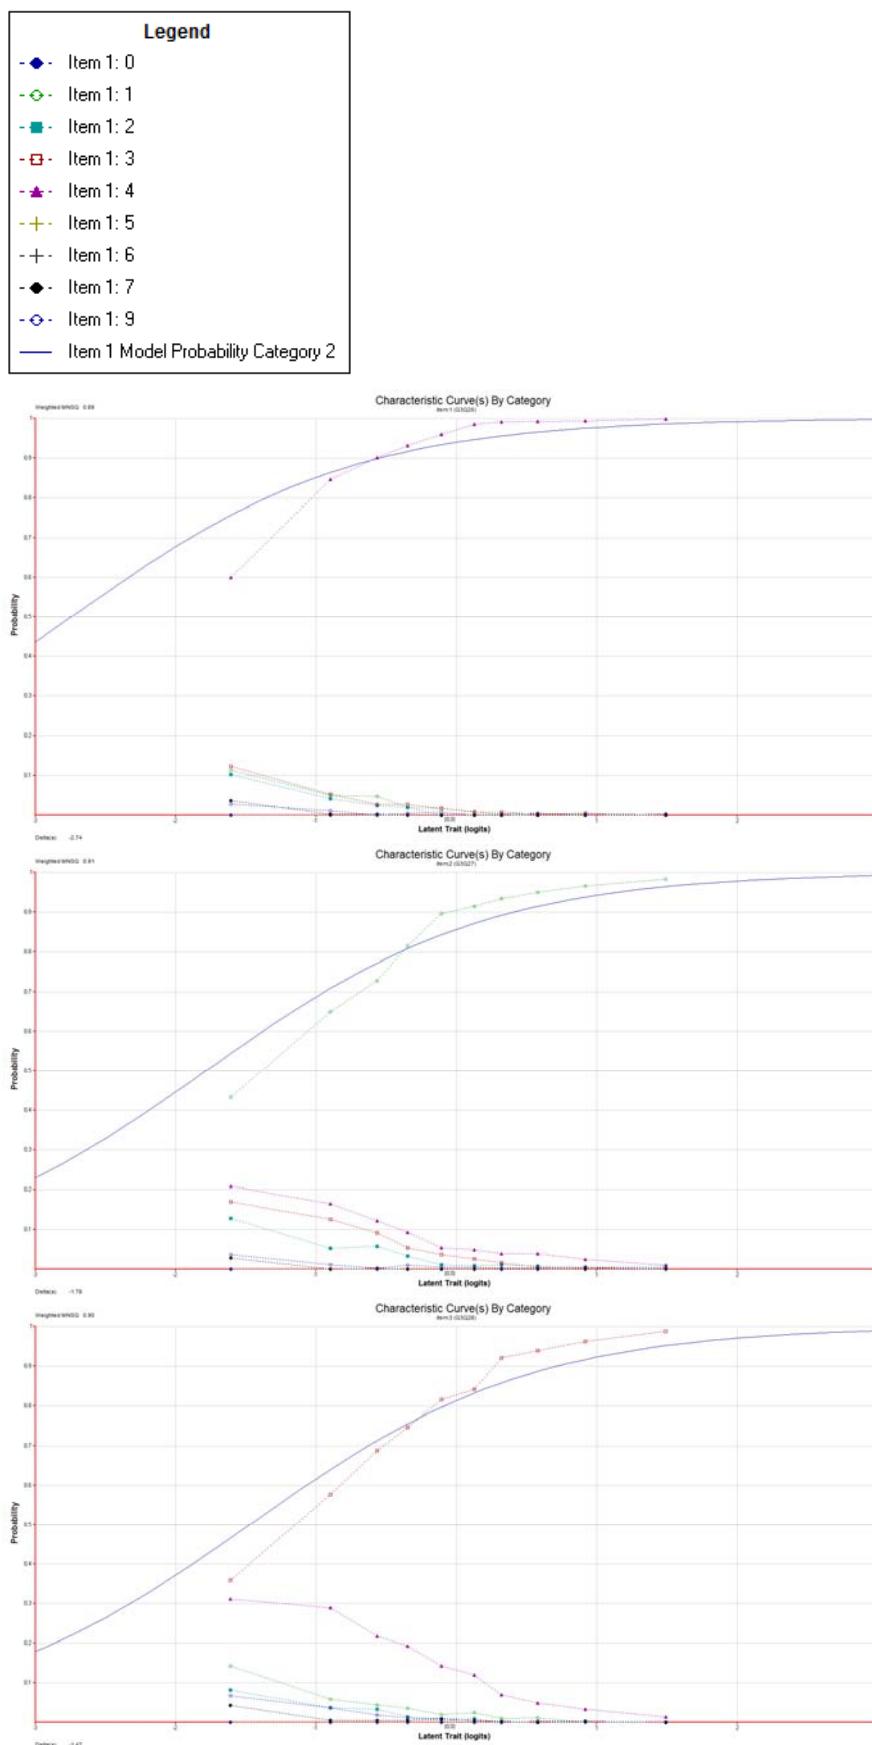

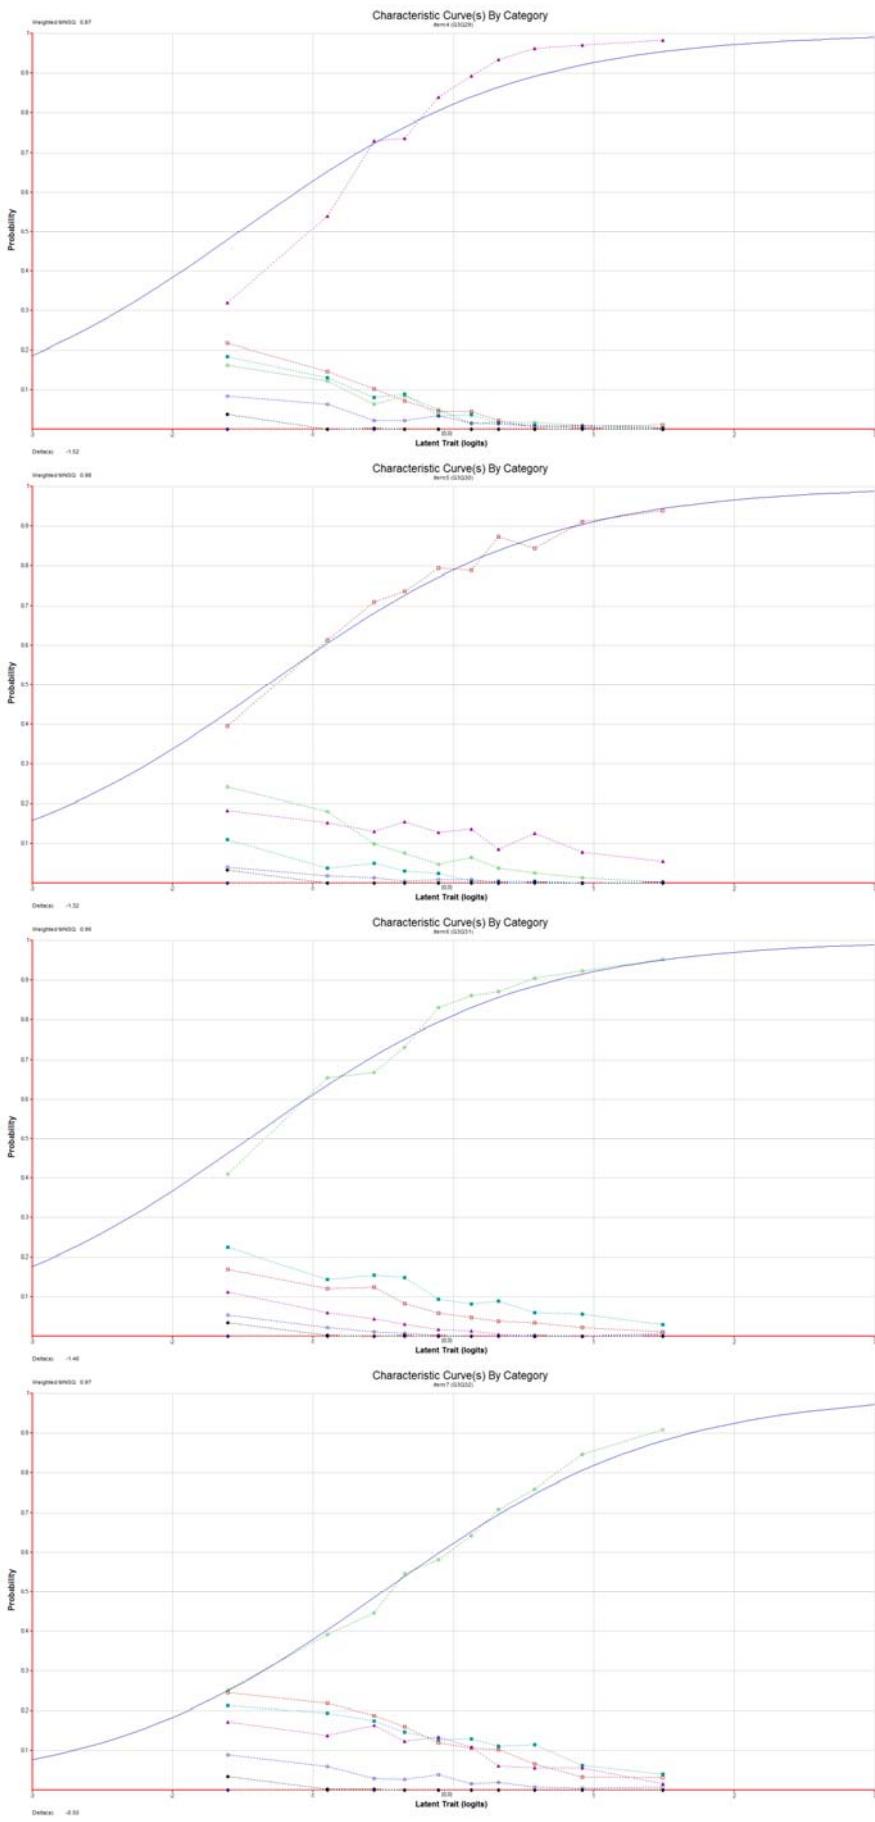

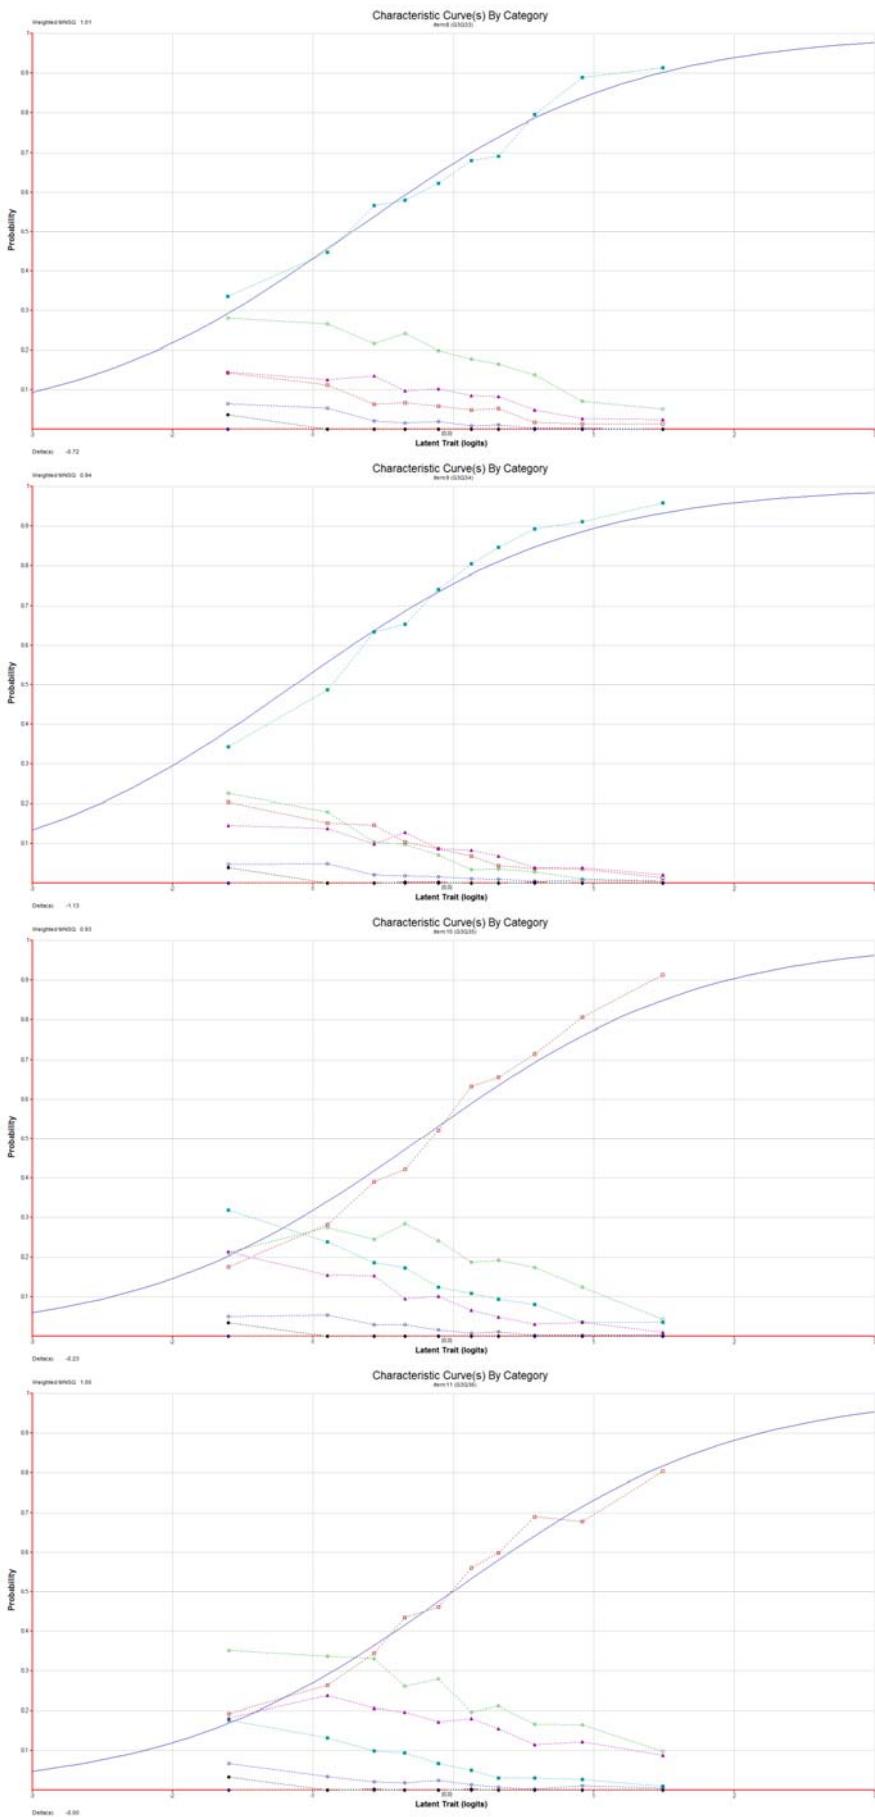

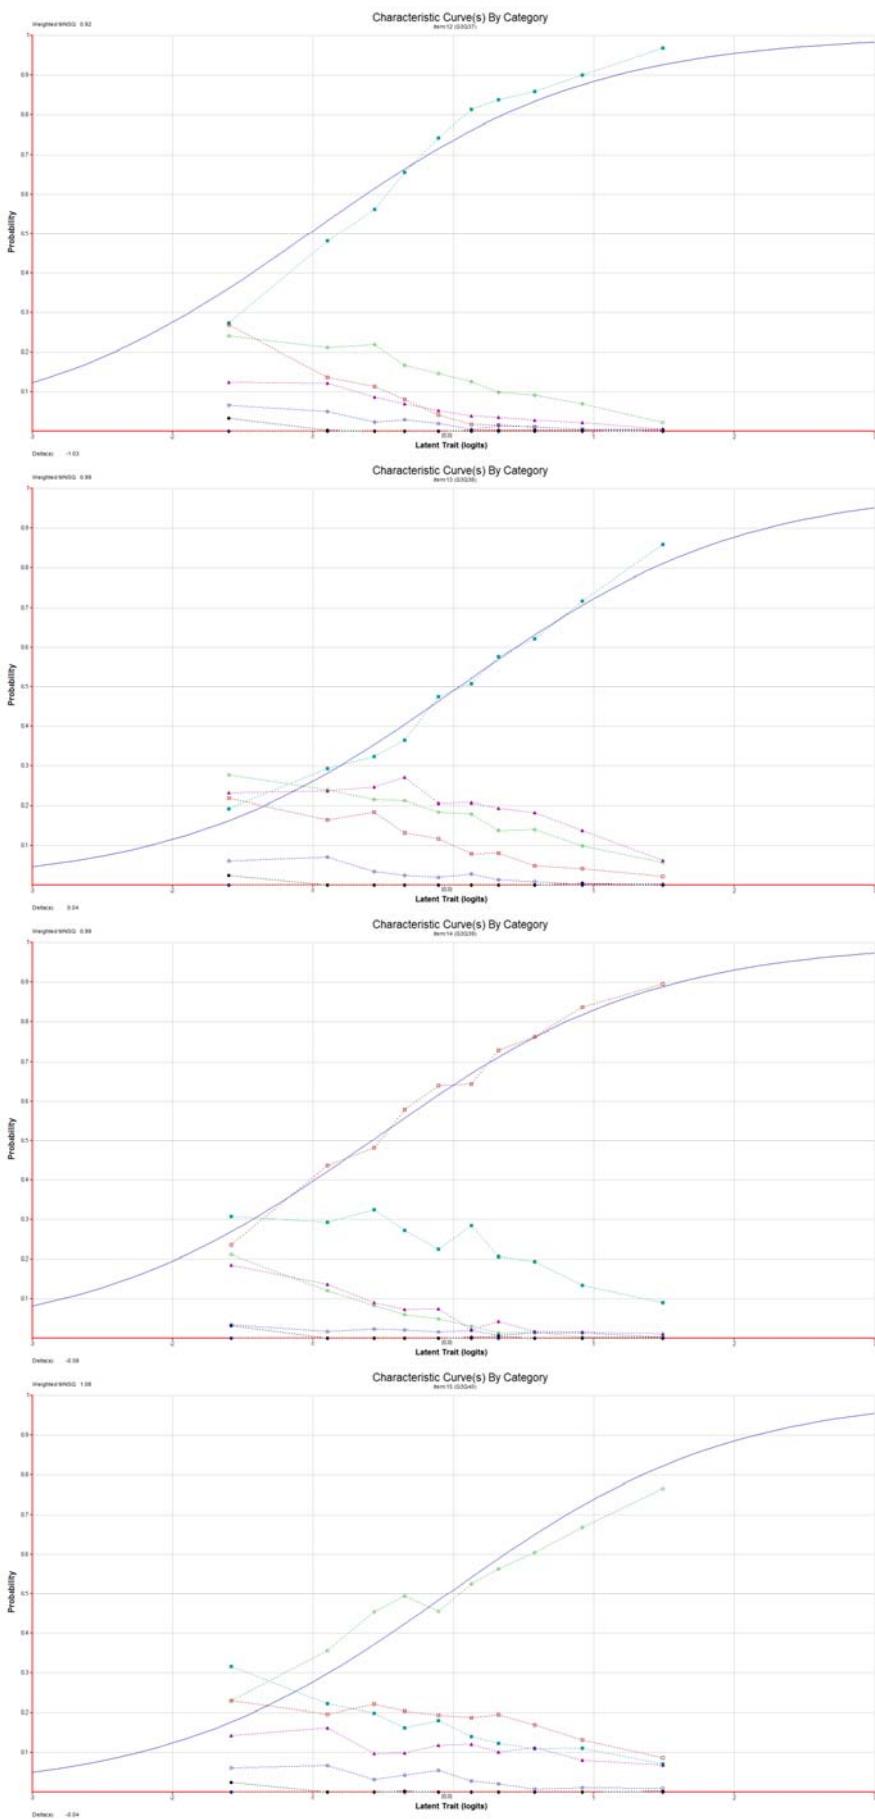

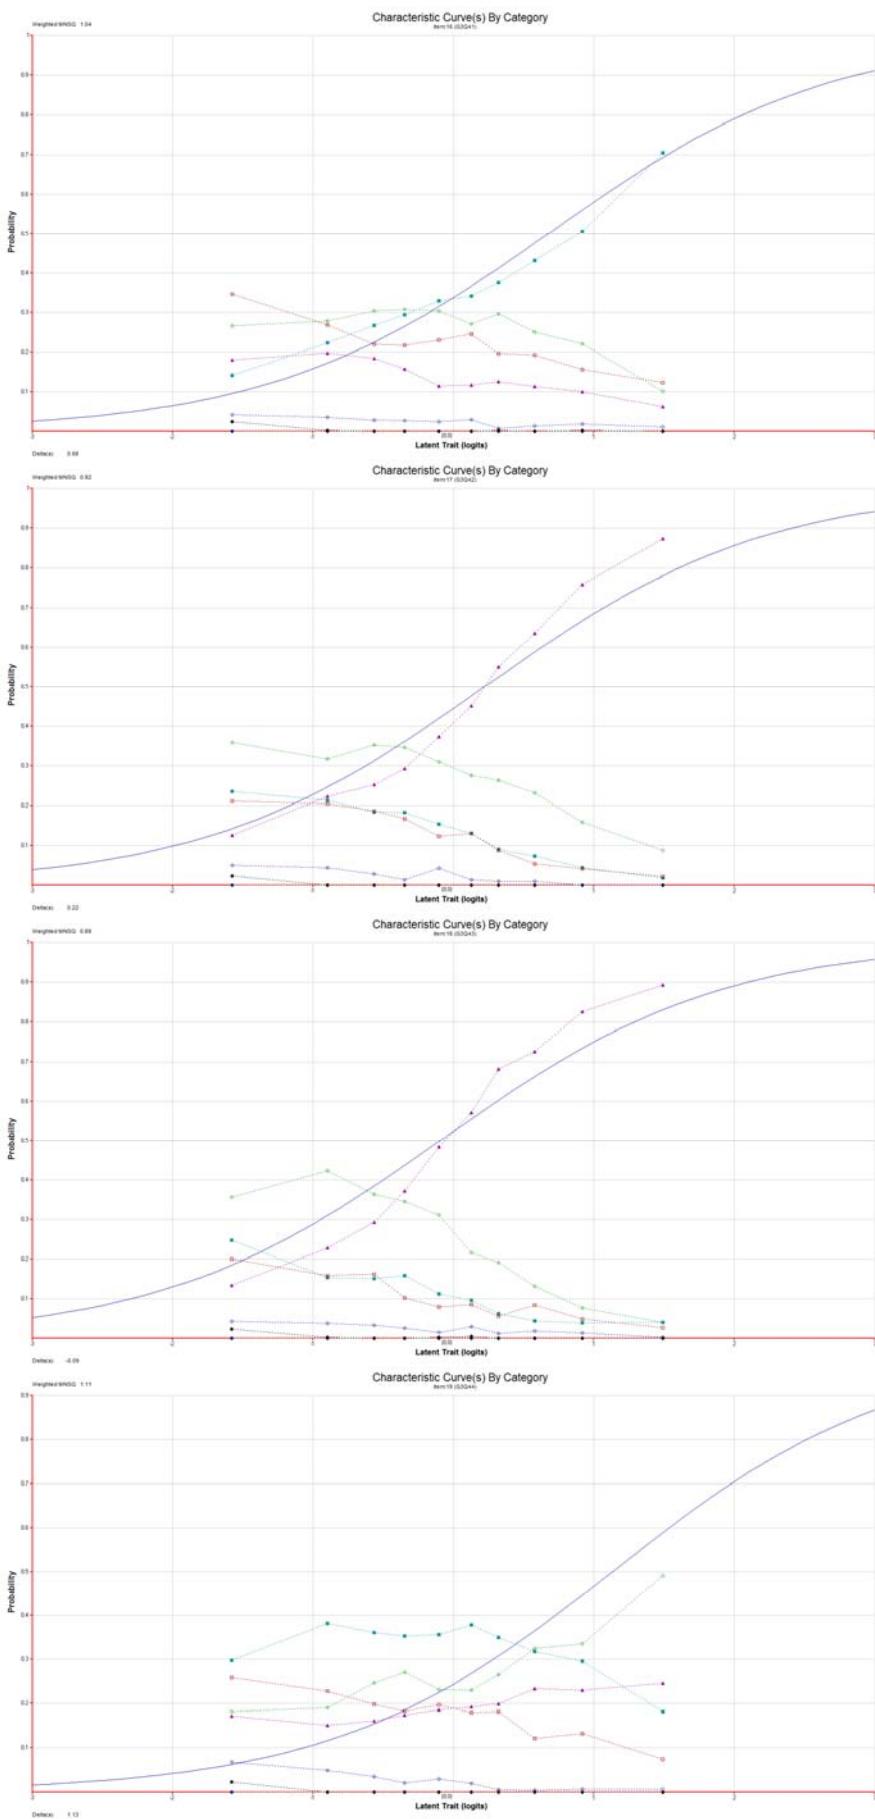

## D.9. Year 3 Grammar and Punctuation

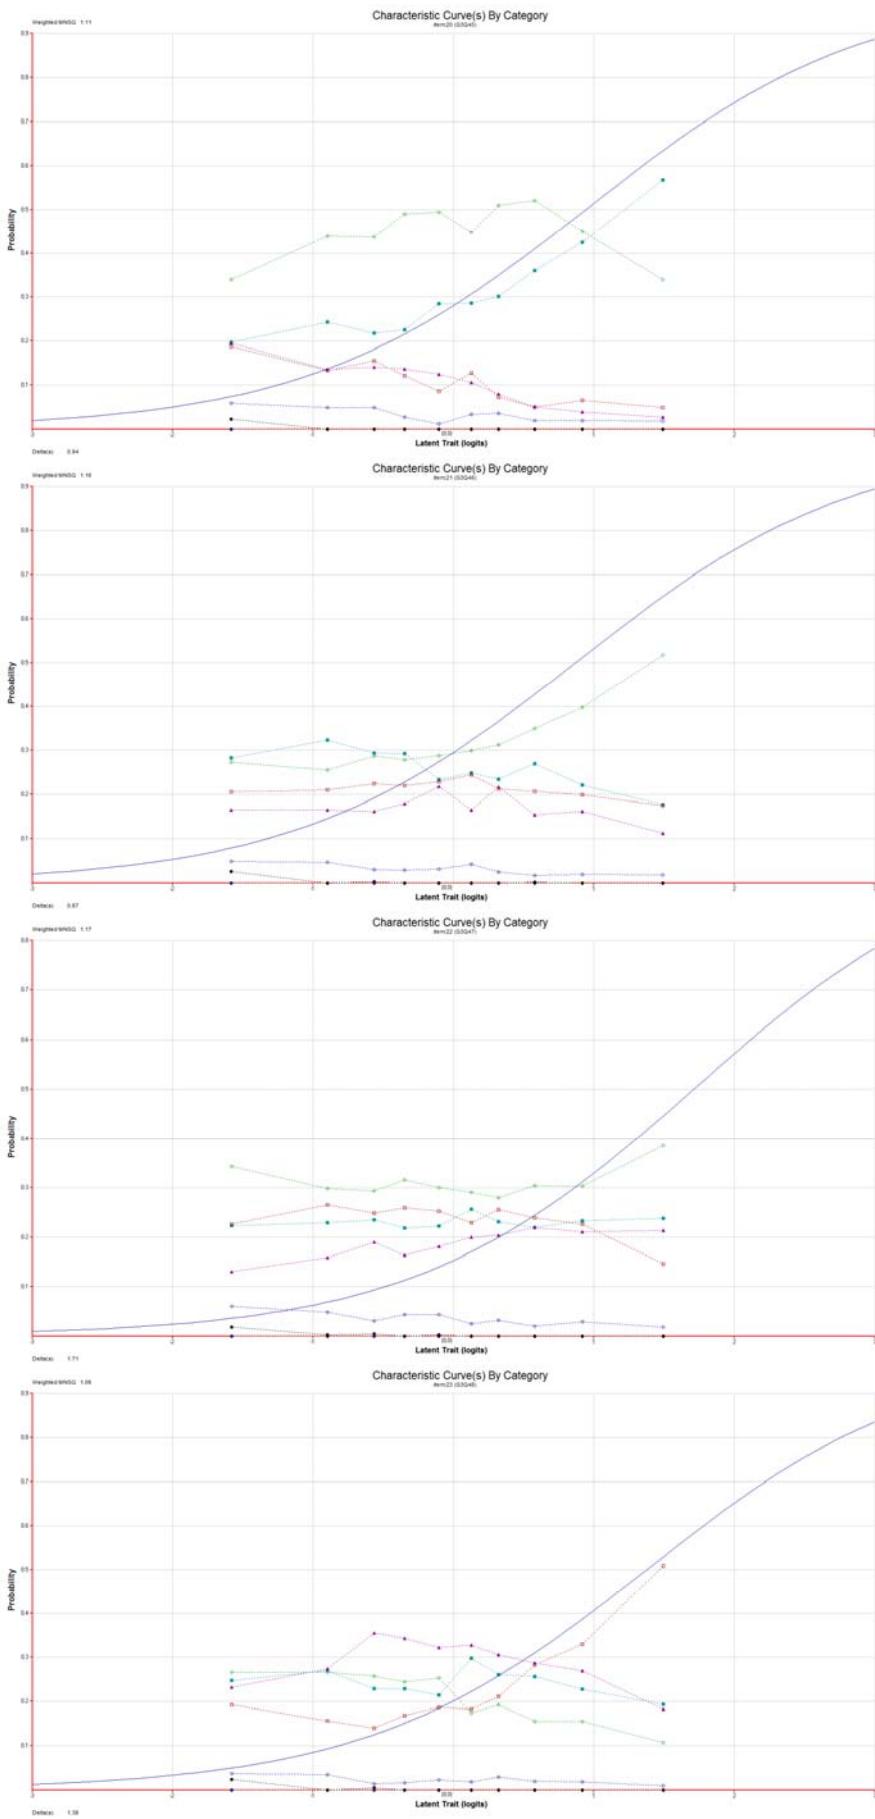

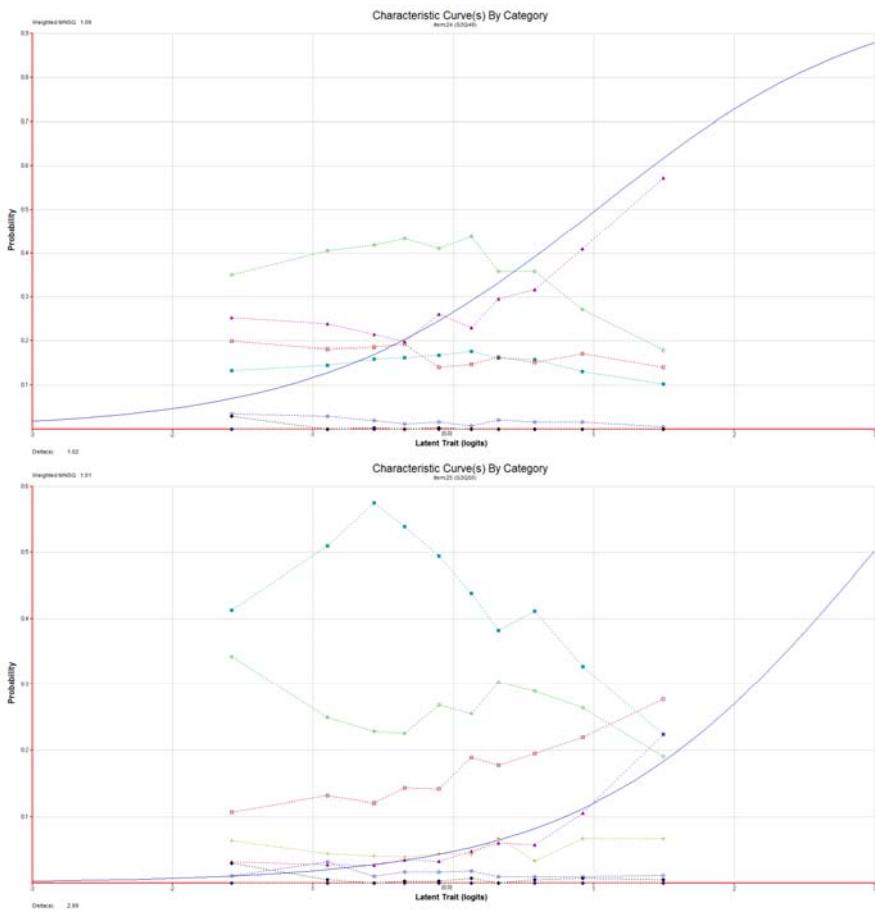

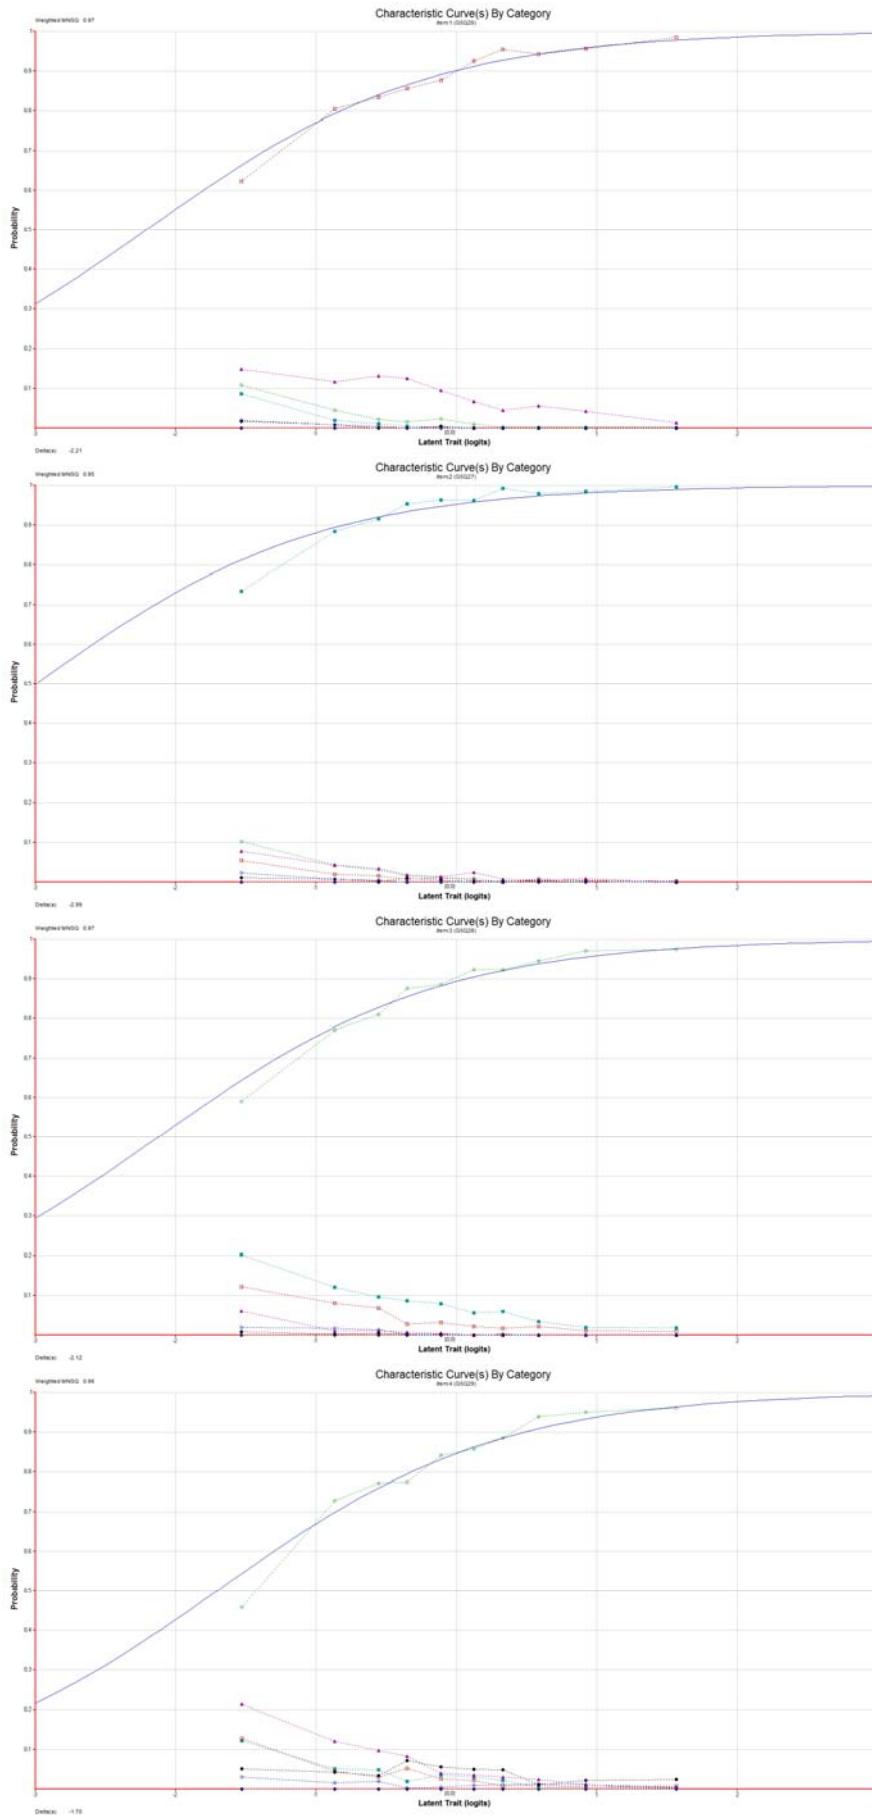

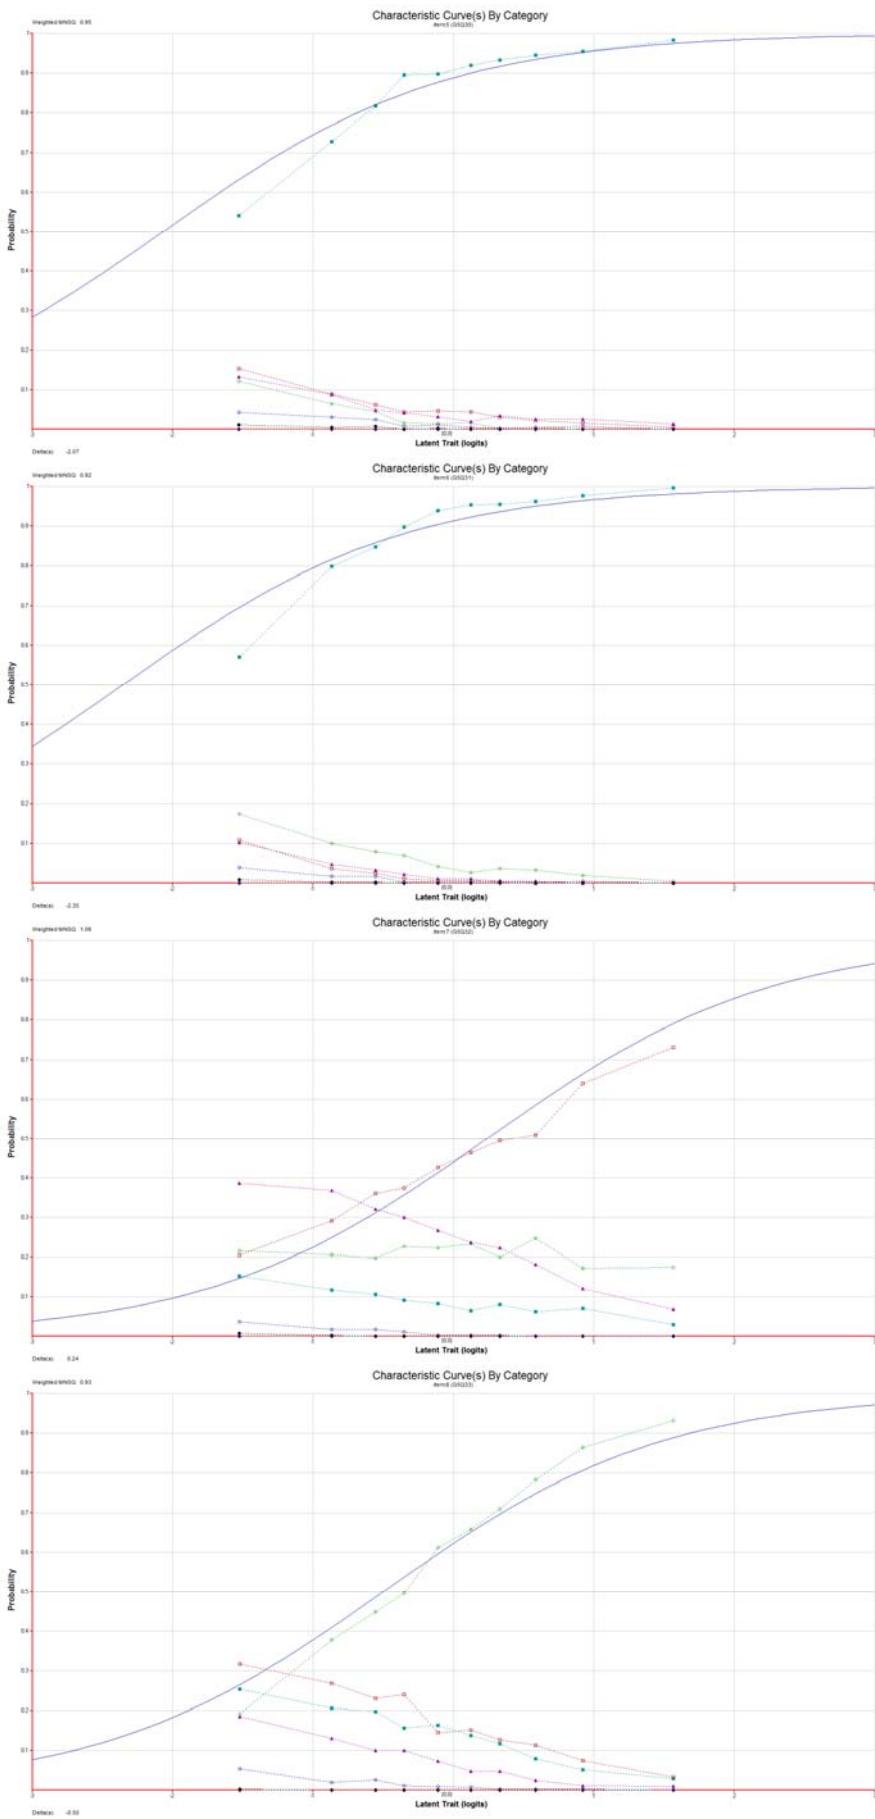

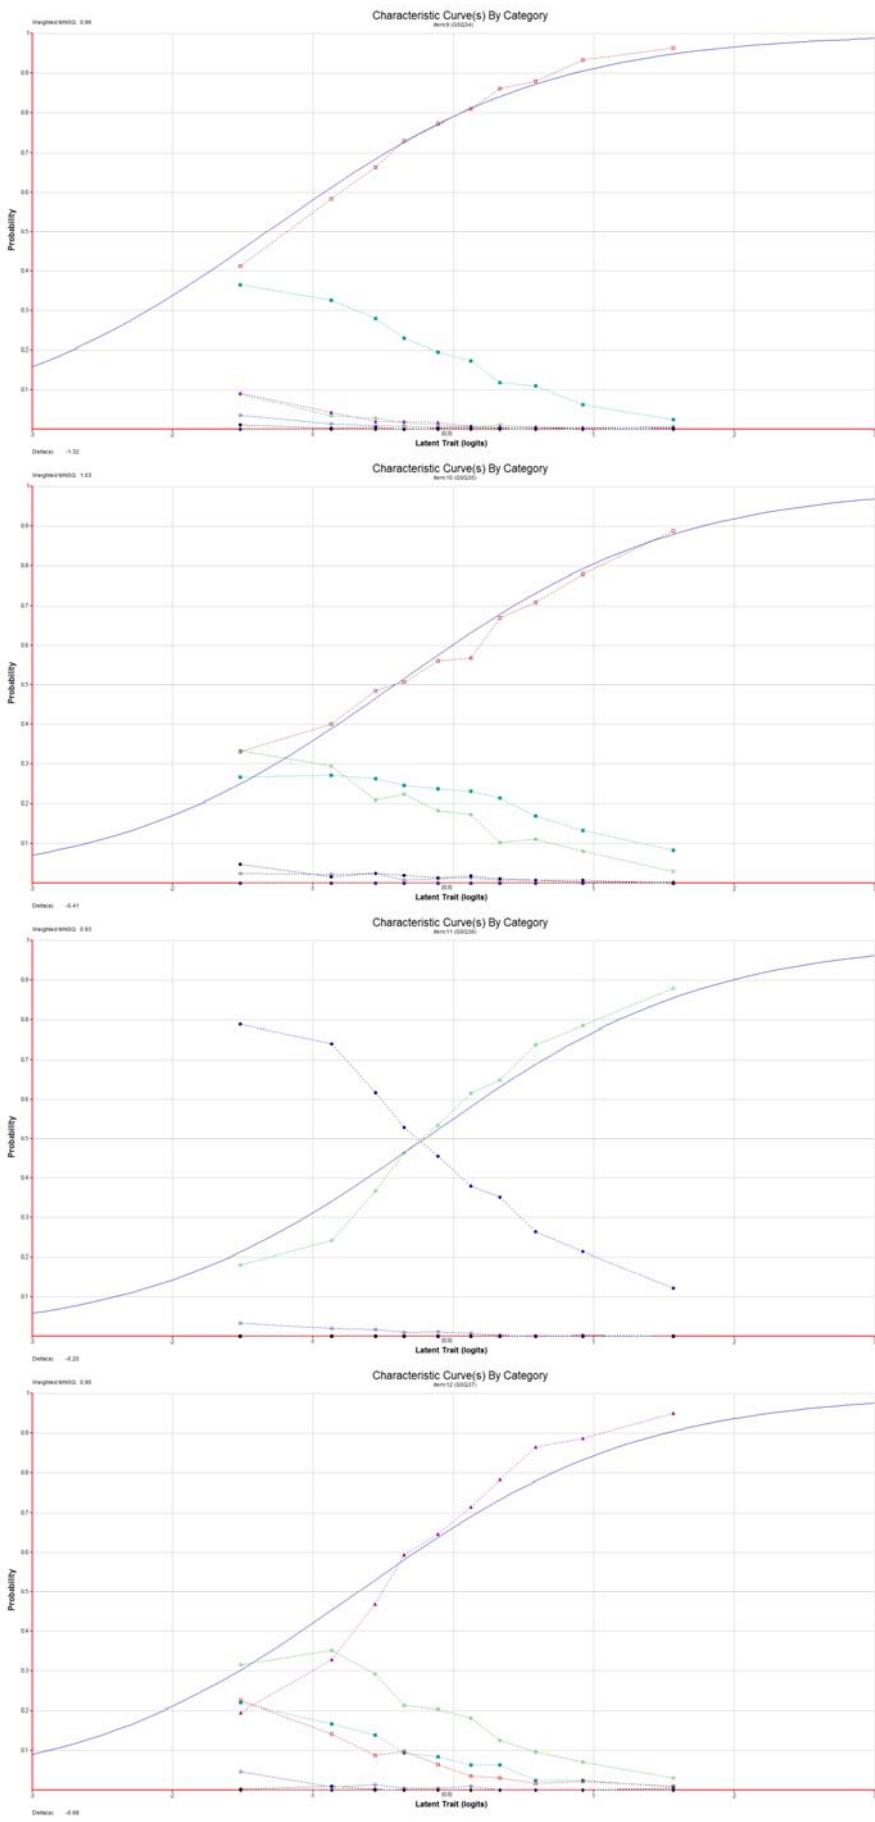

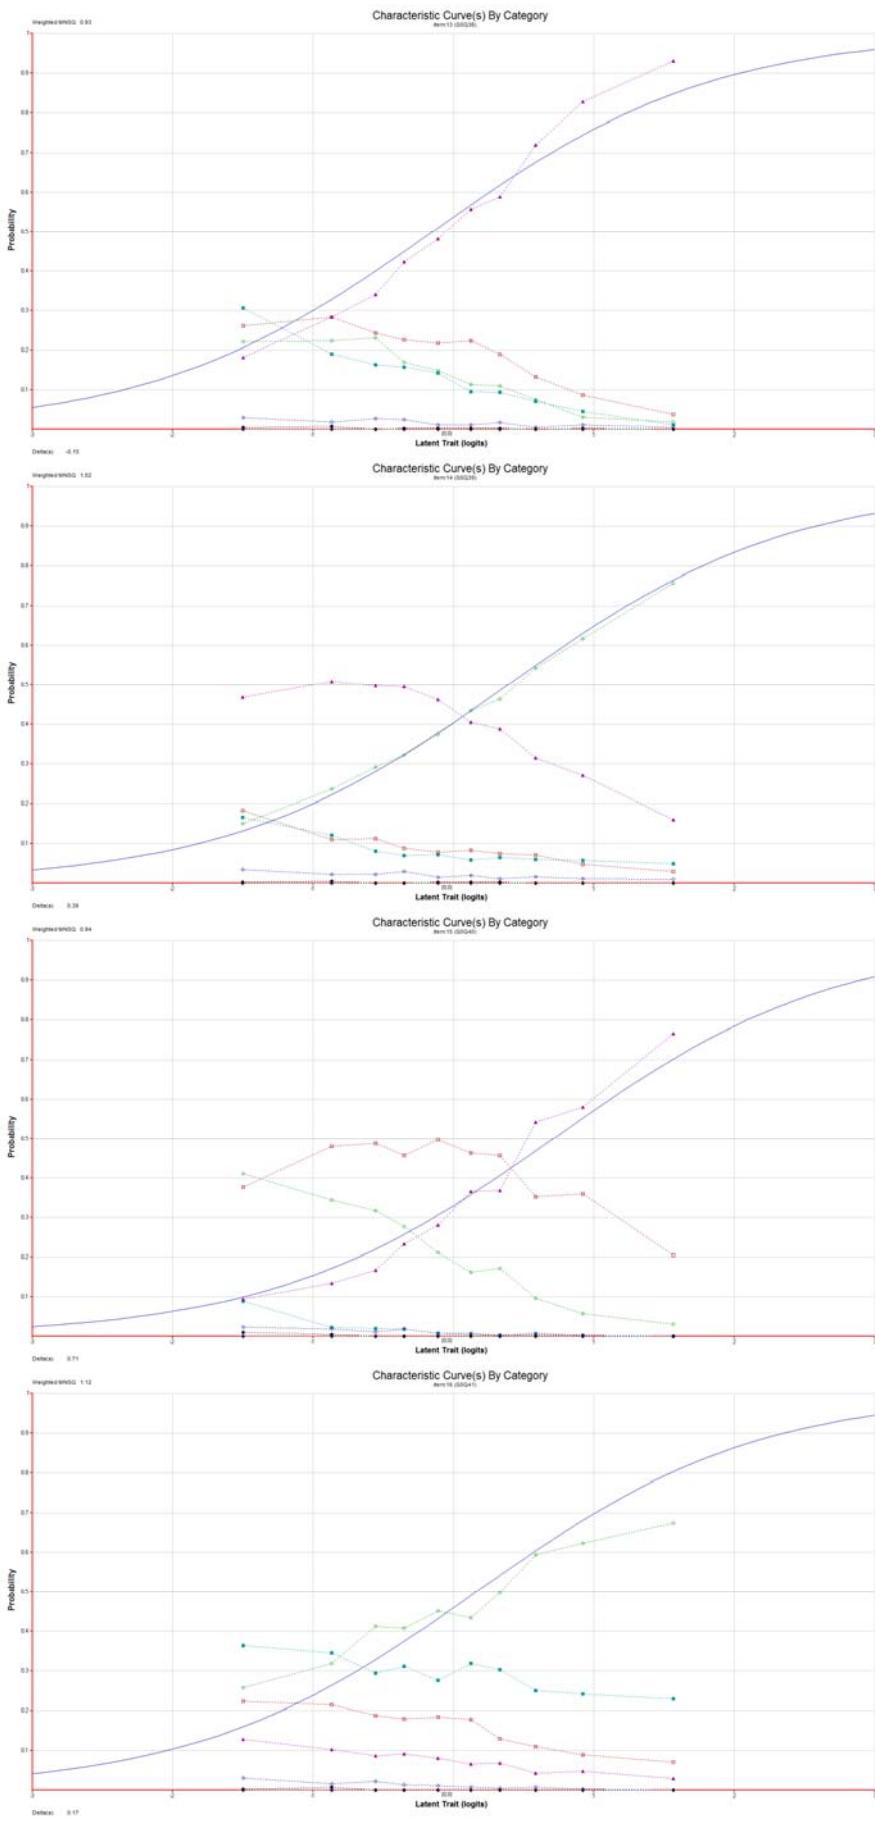

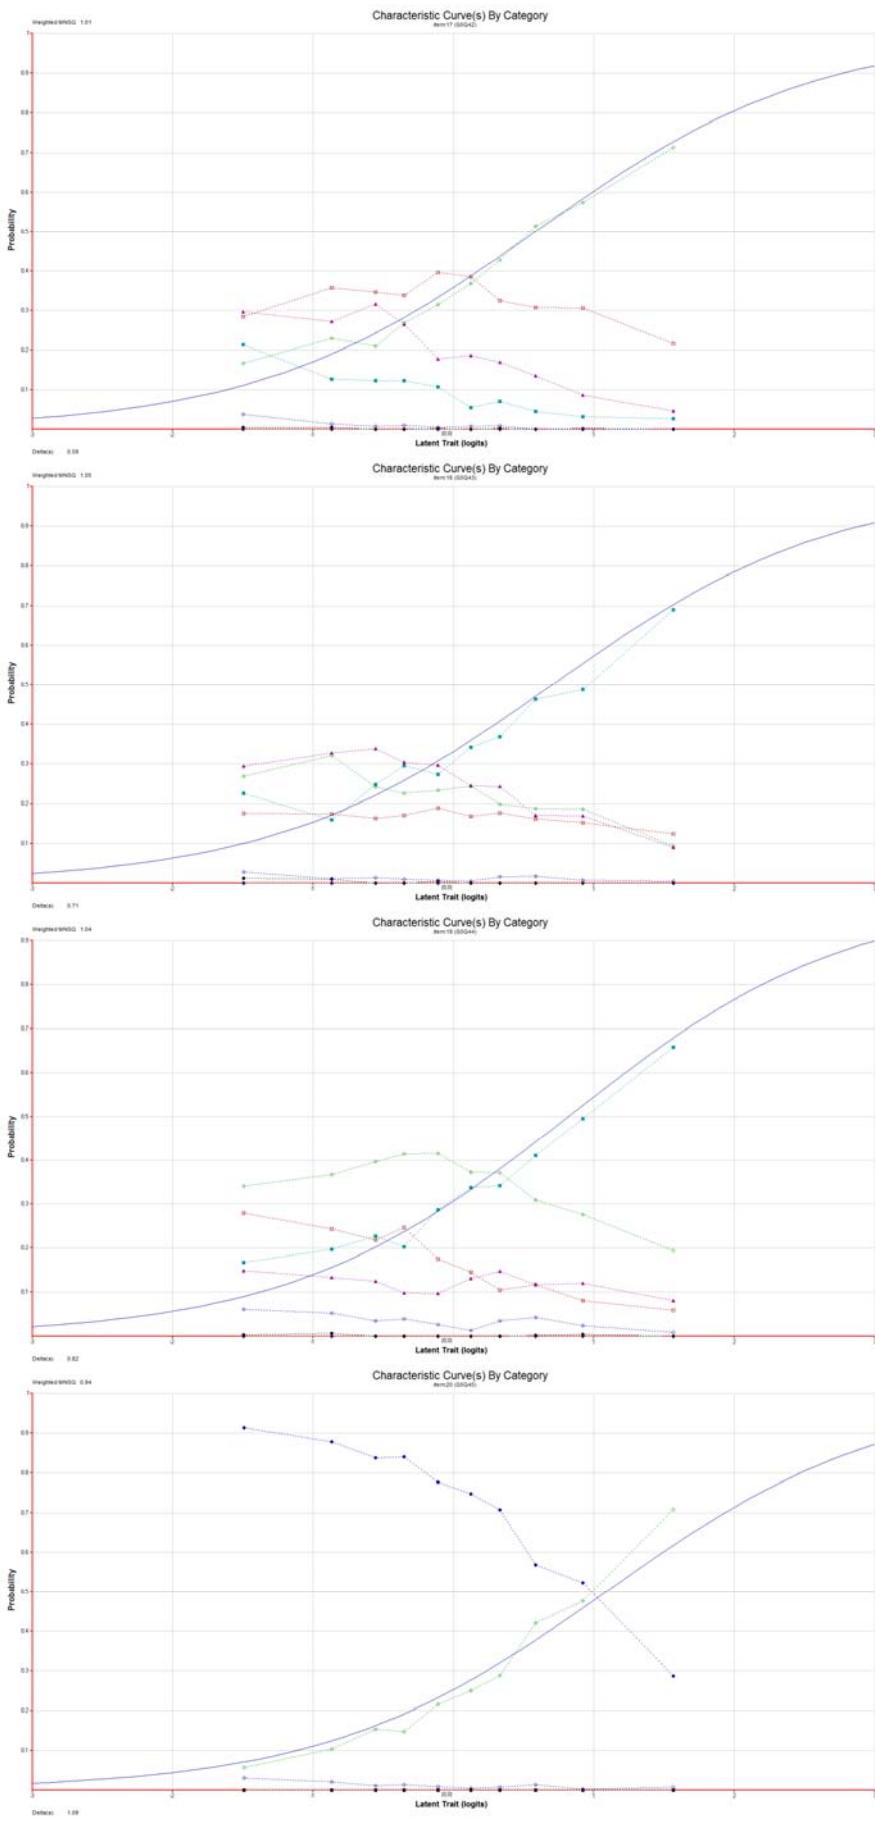

## D.10. Year 5 Grammar and Punctuation

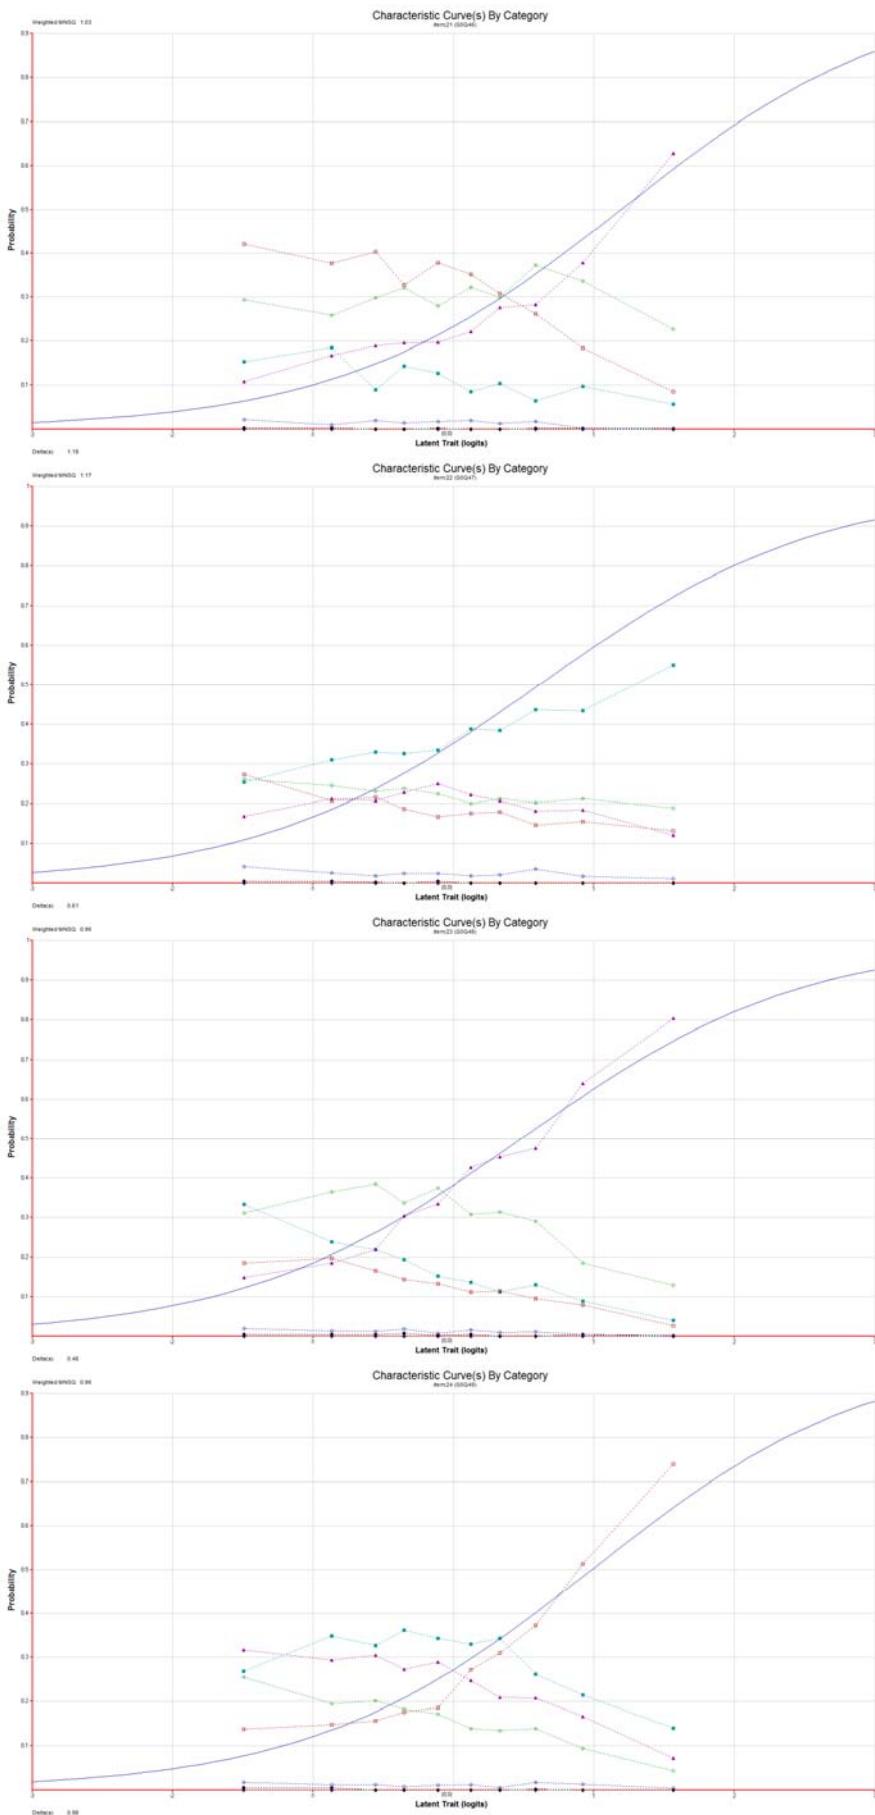

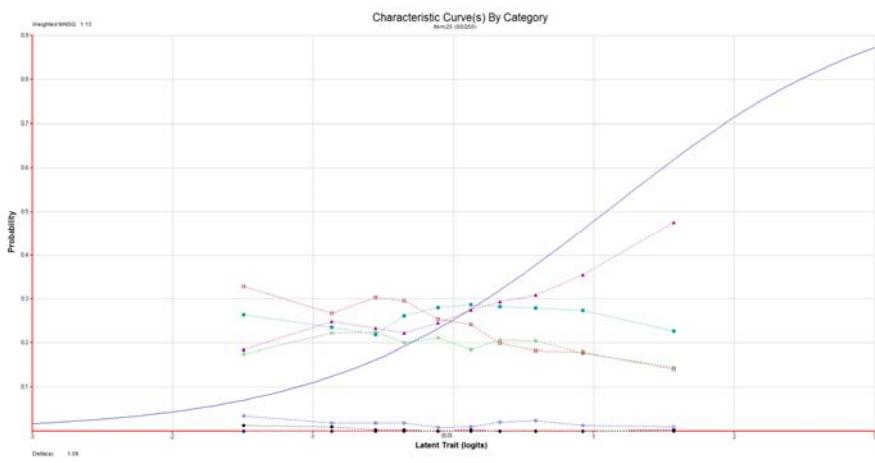

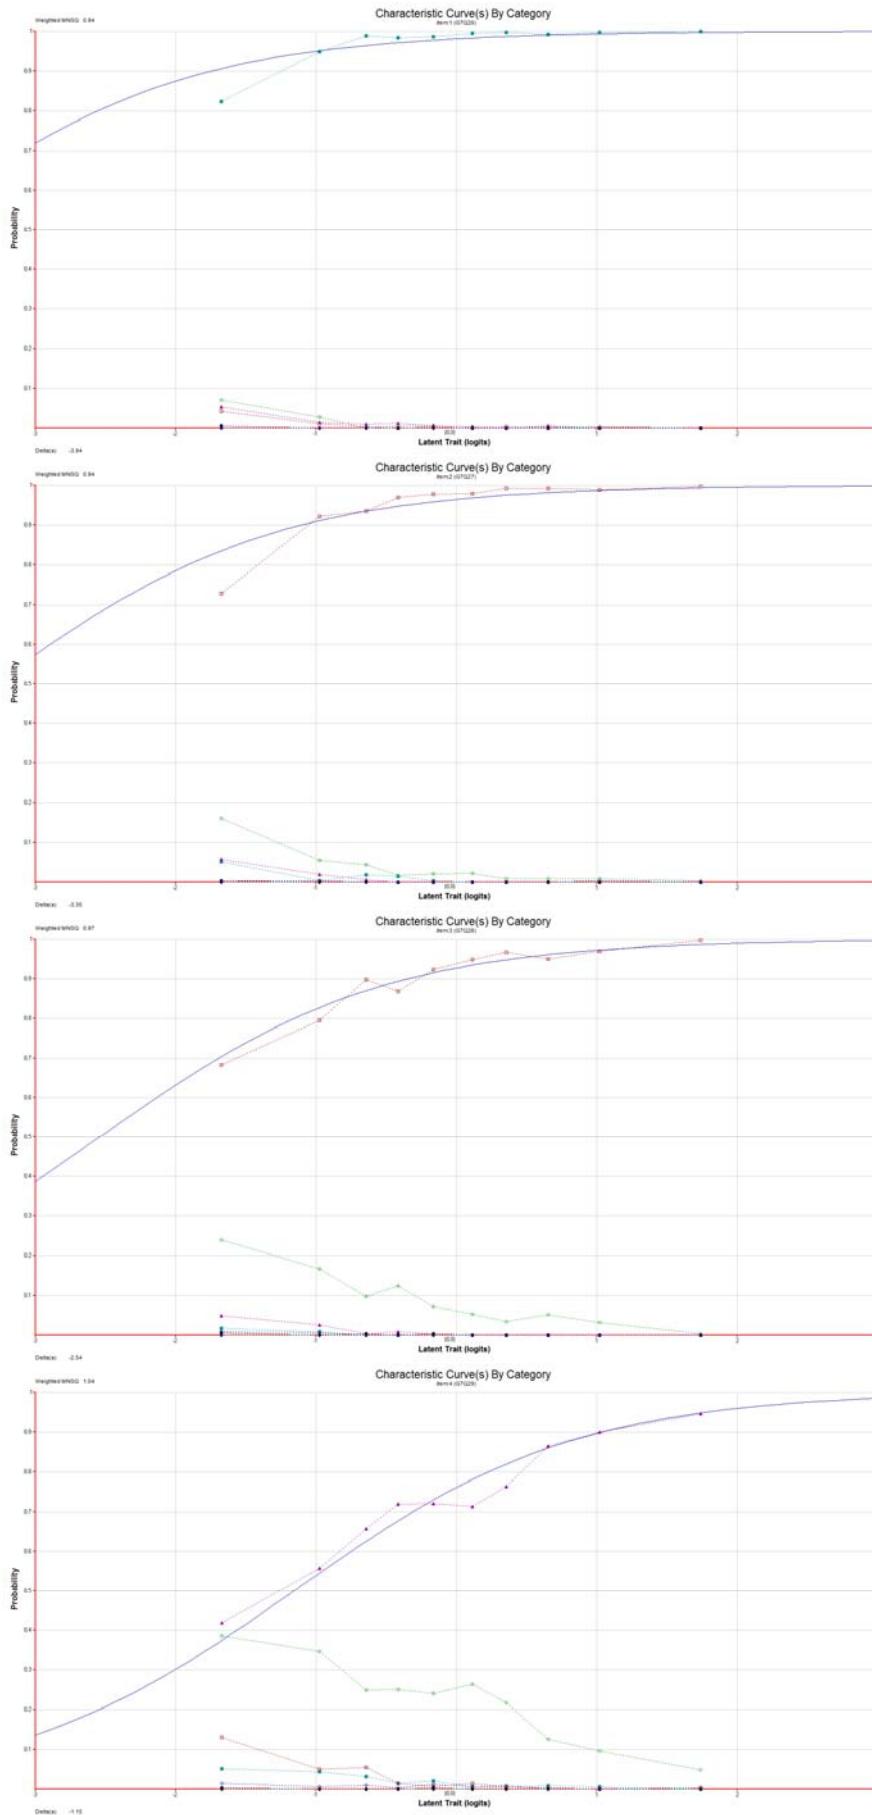

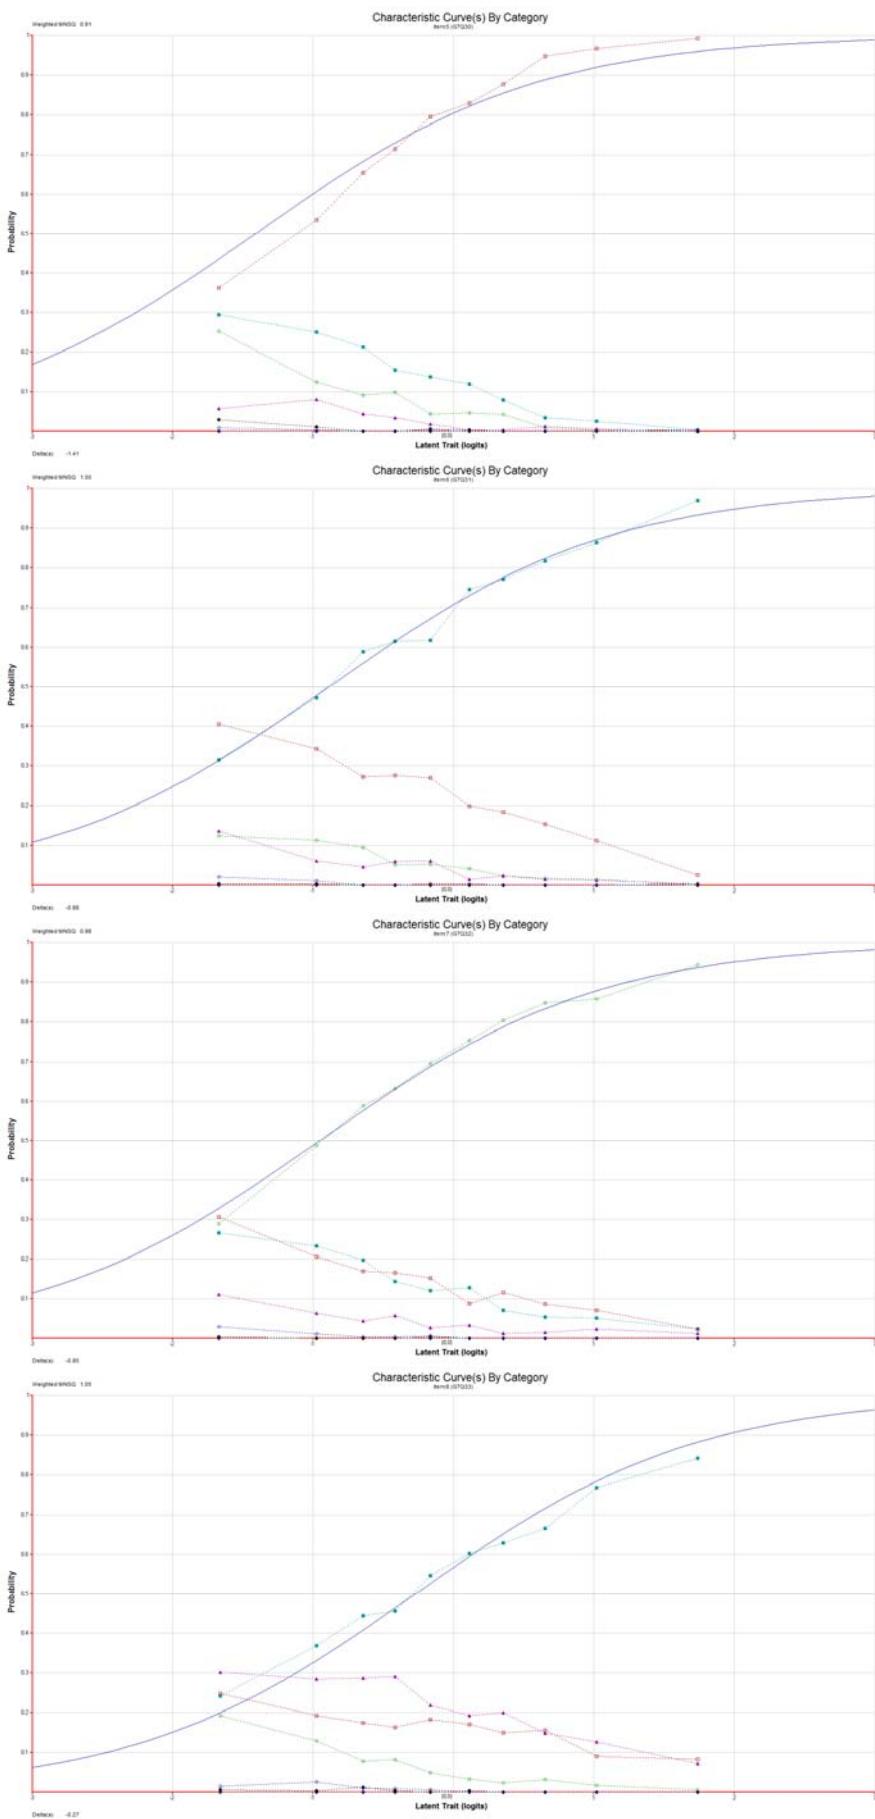

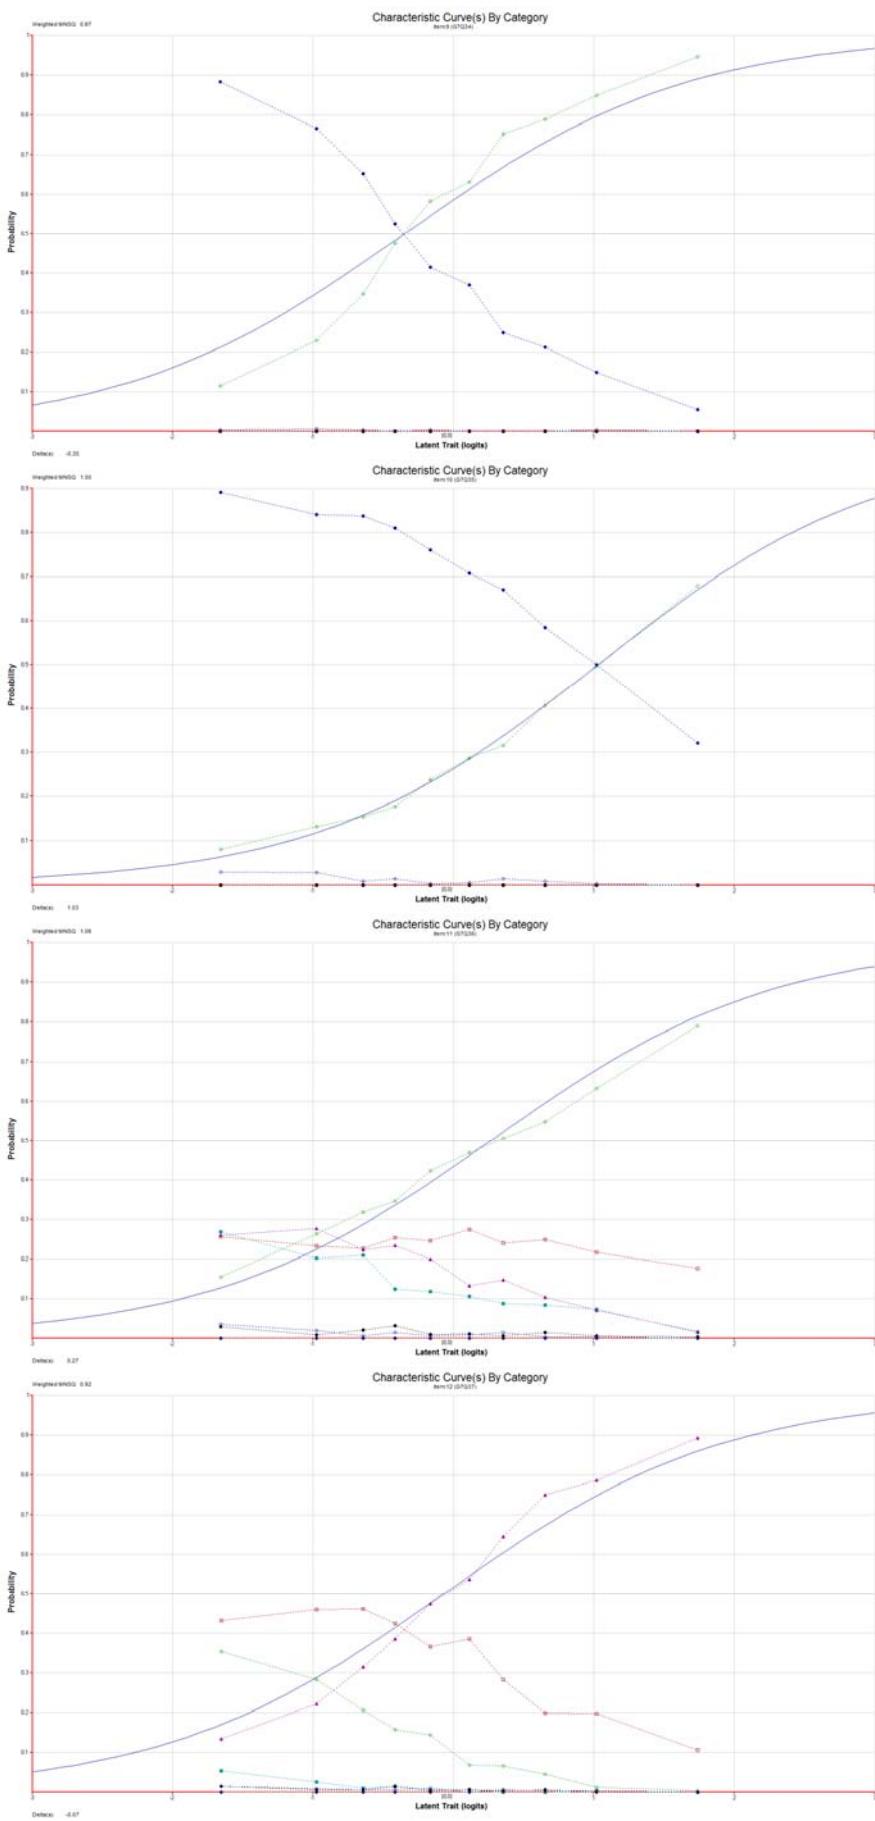

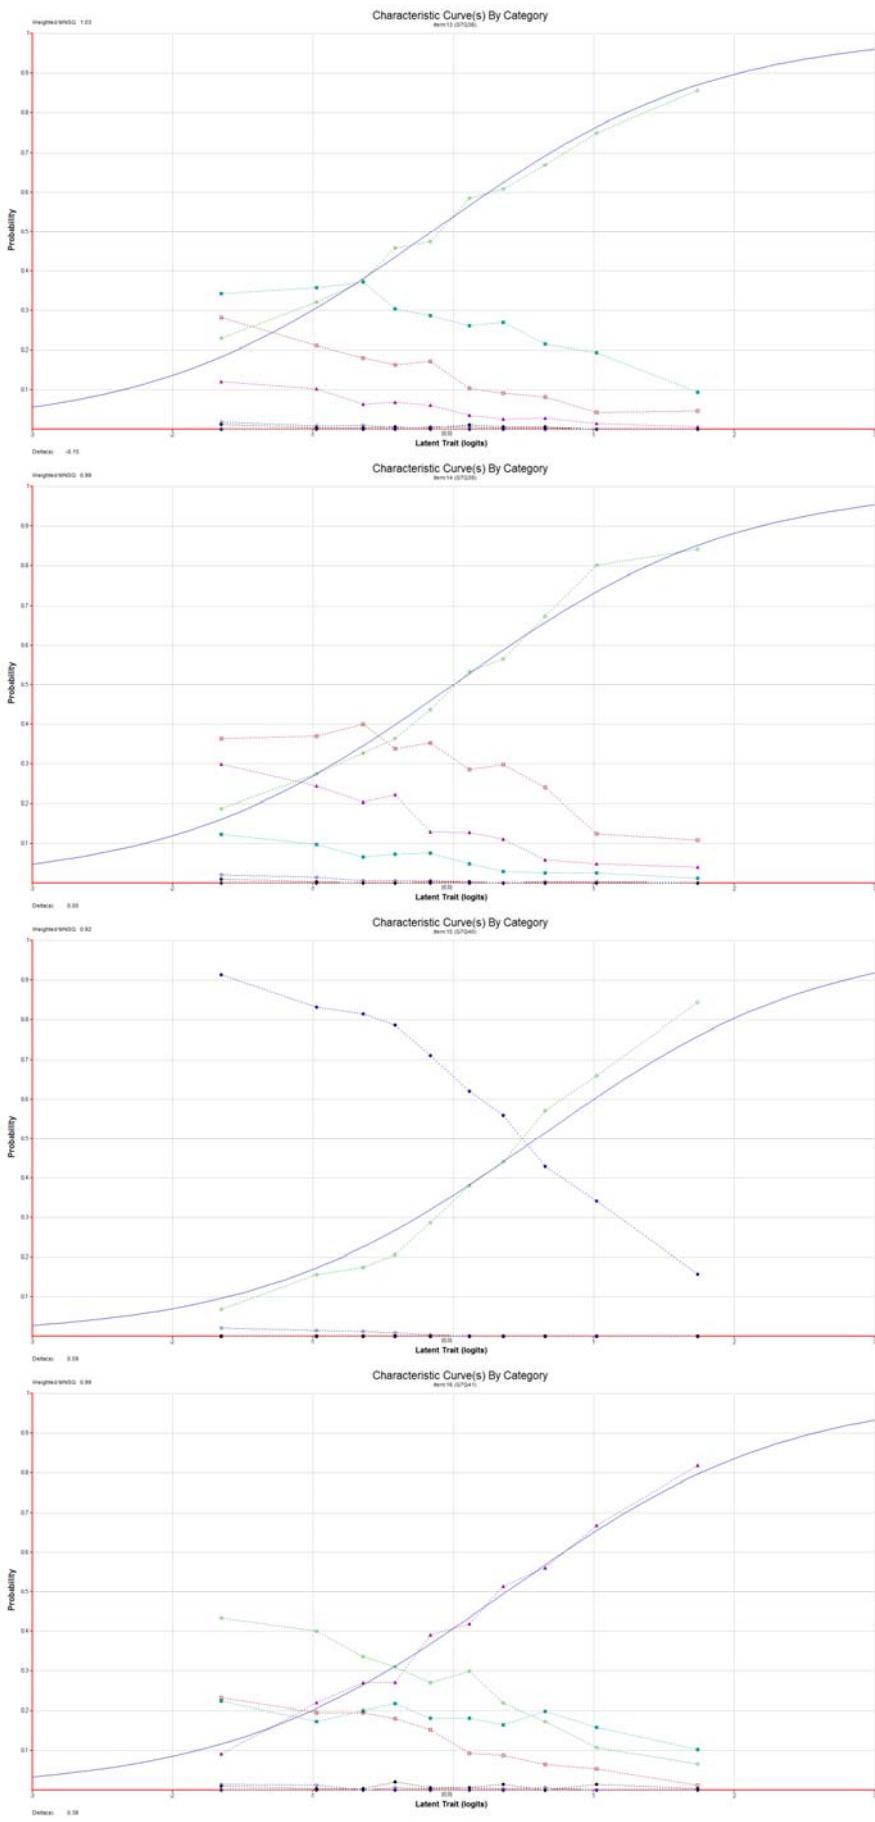

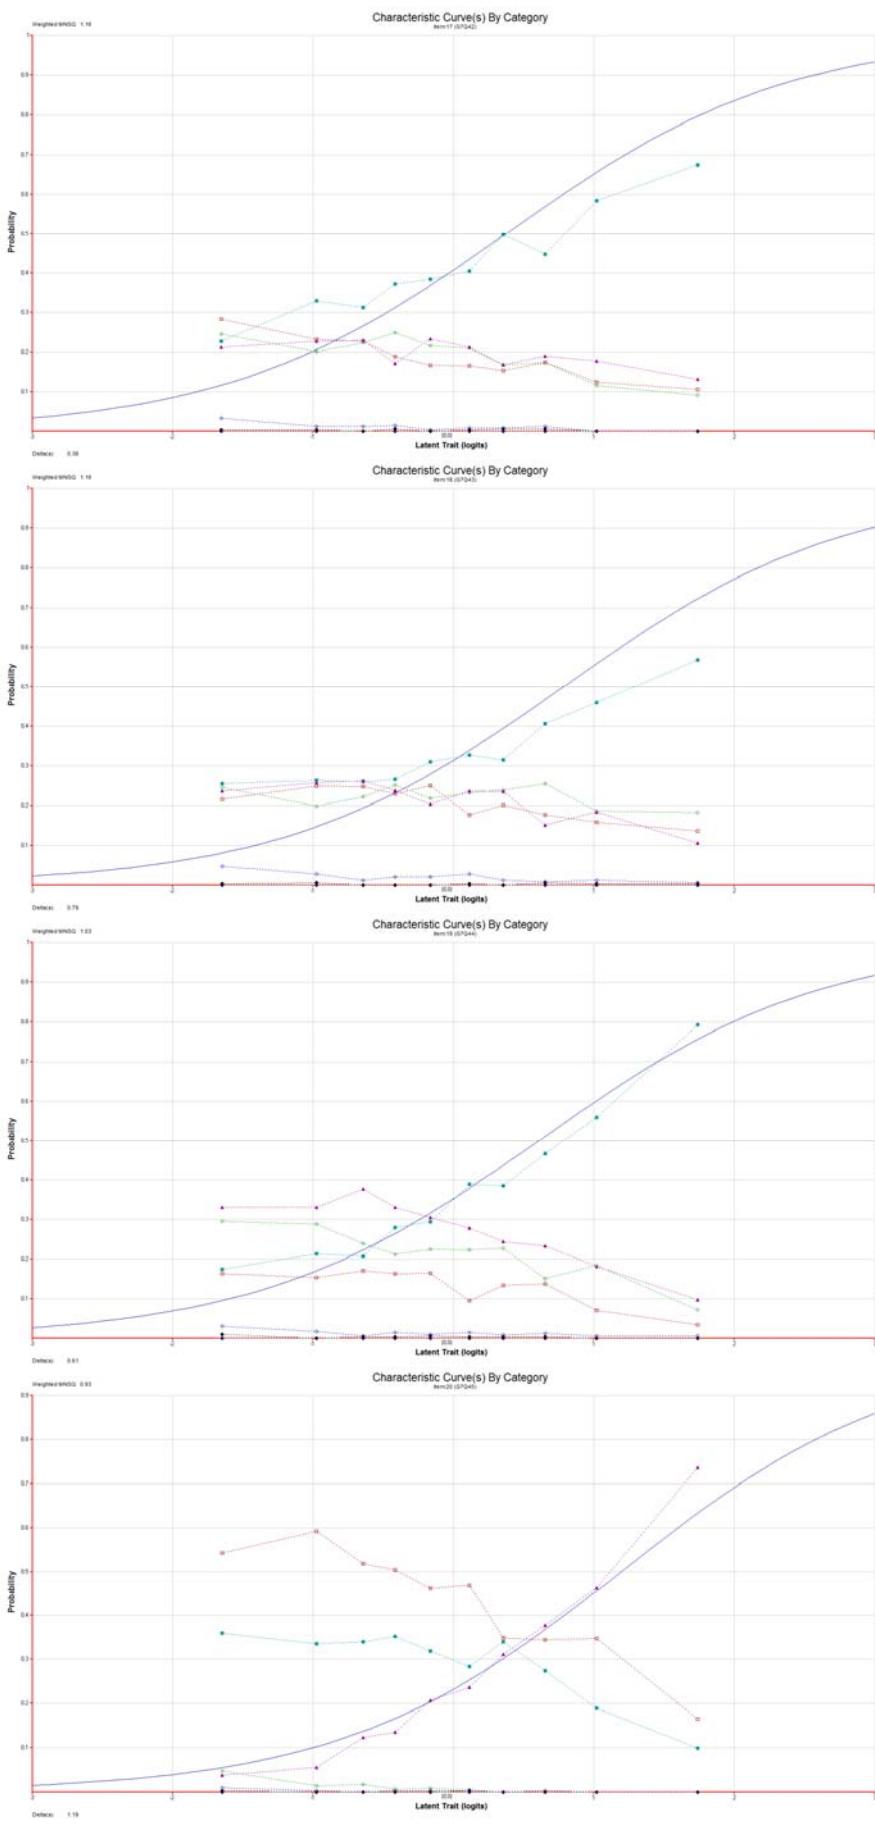

## D.11. Year 7 Grammar and Punctuation

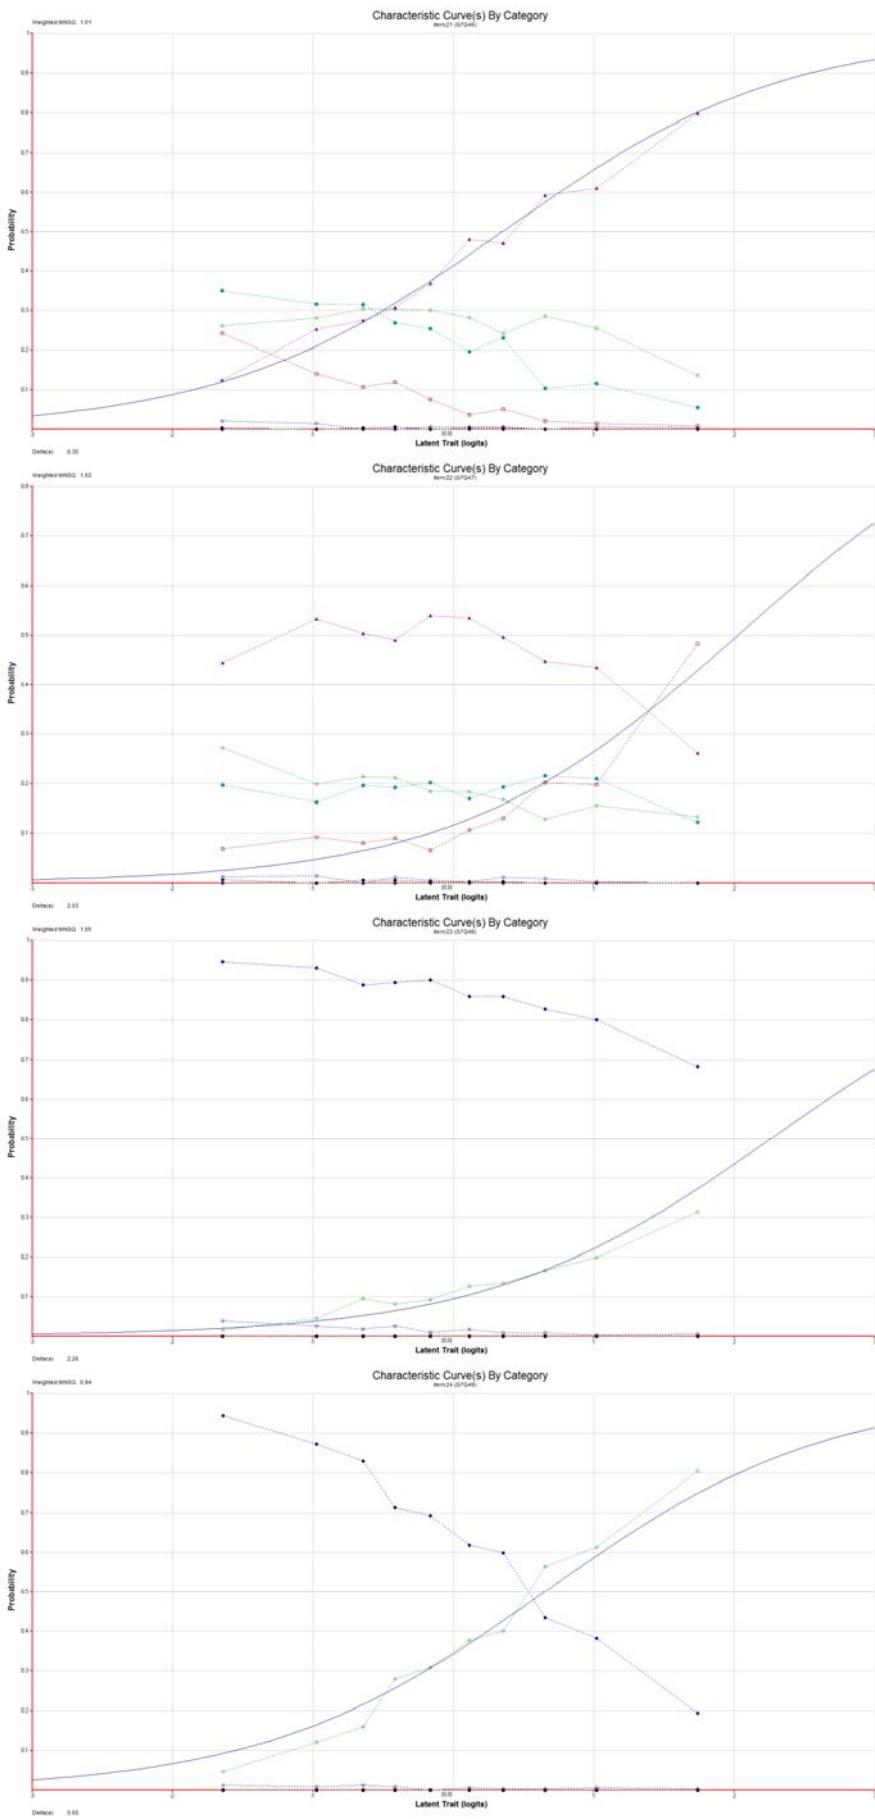

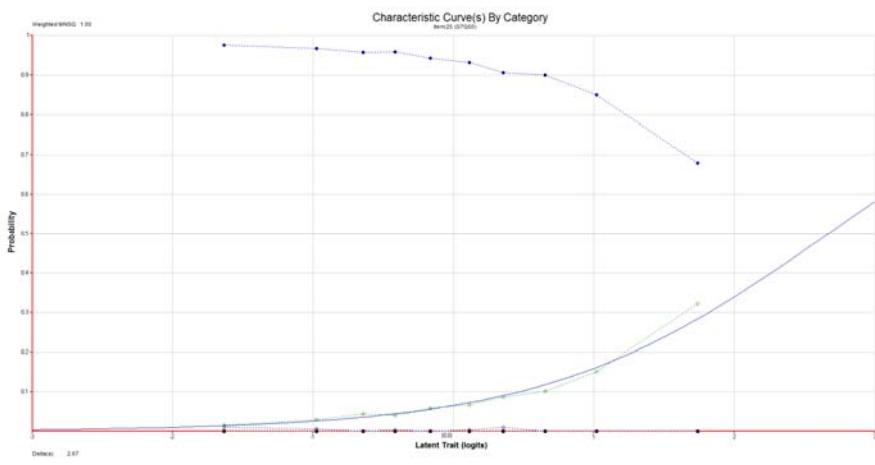

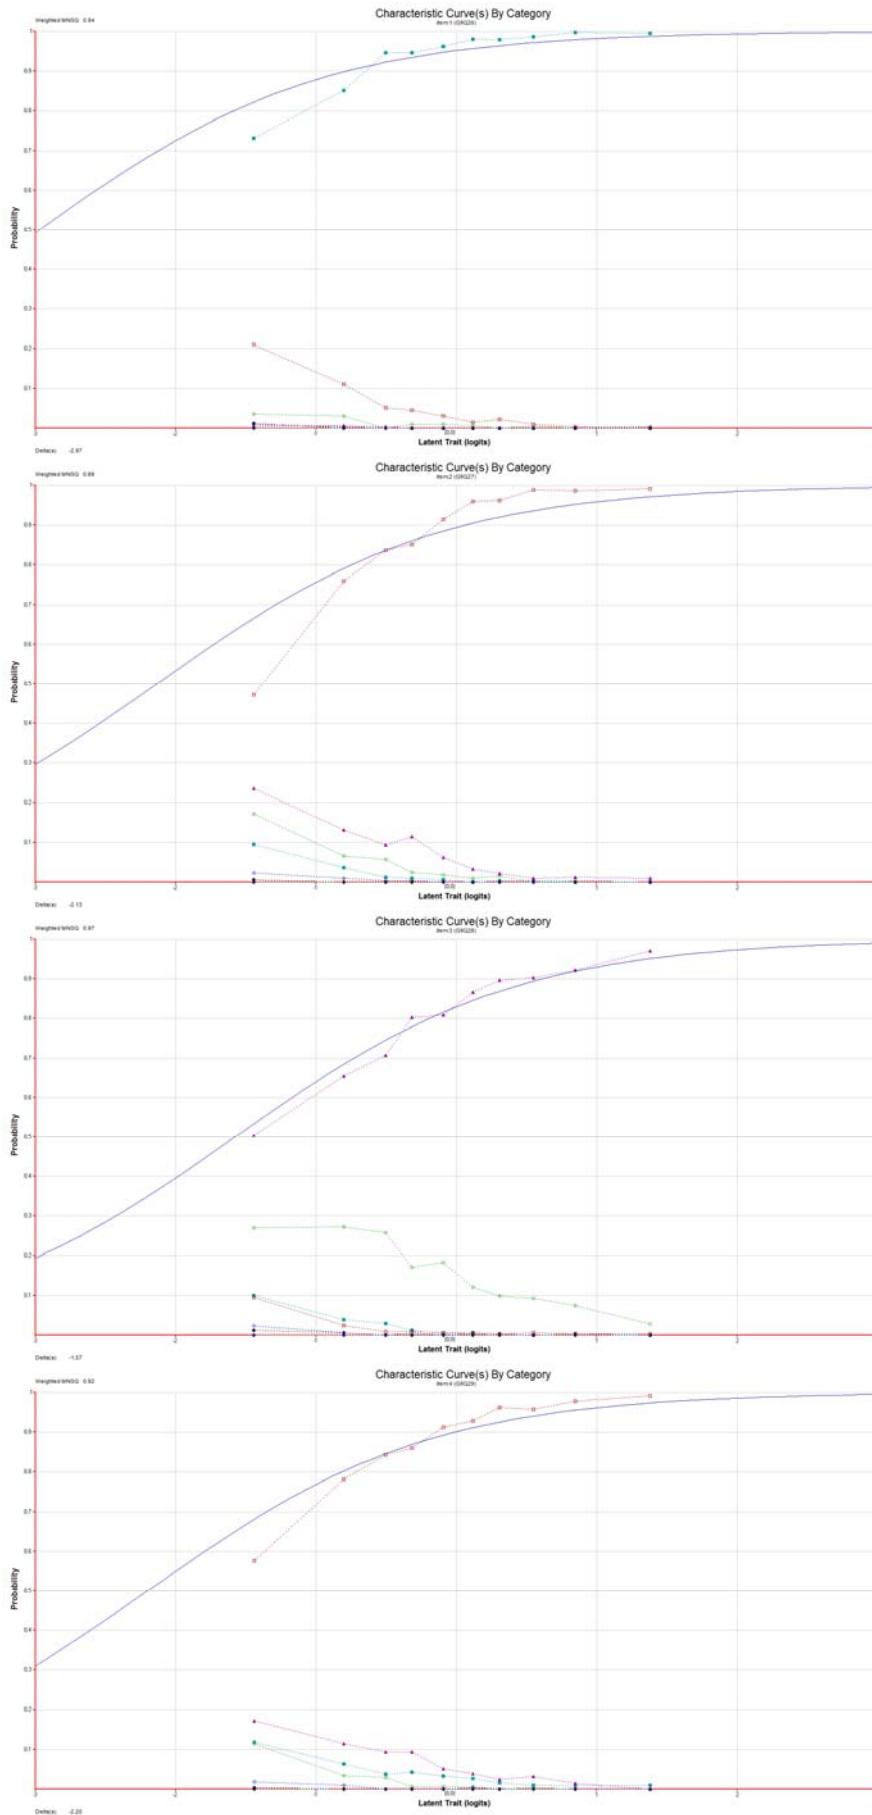

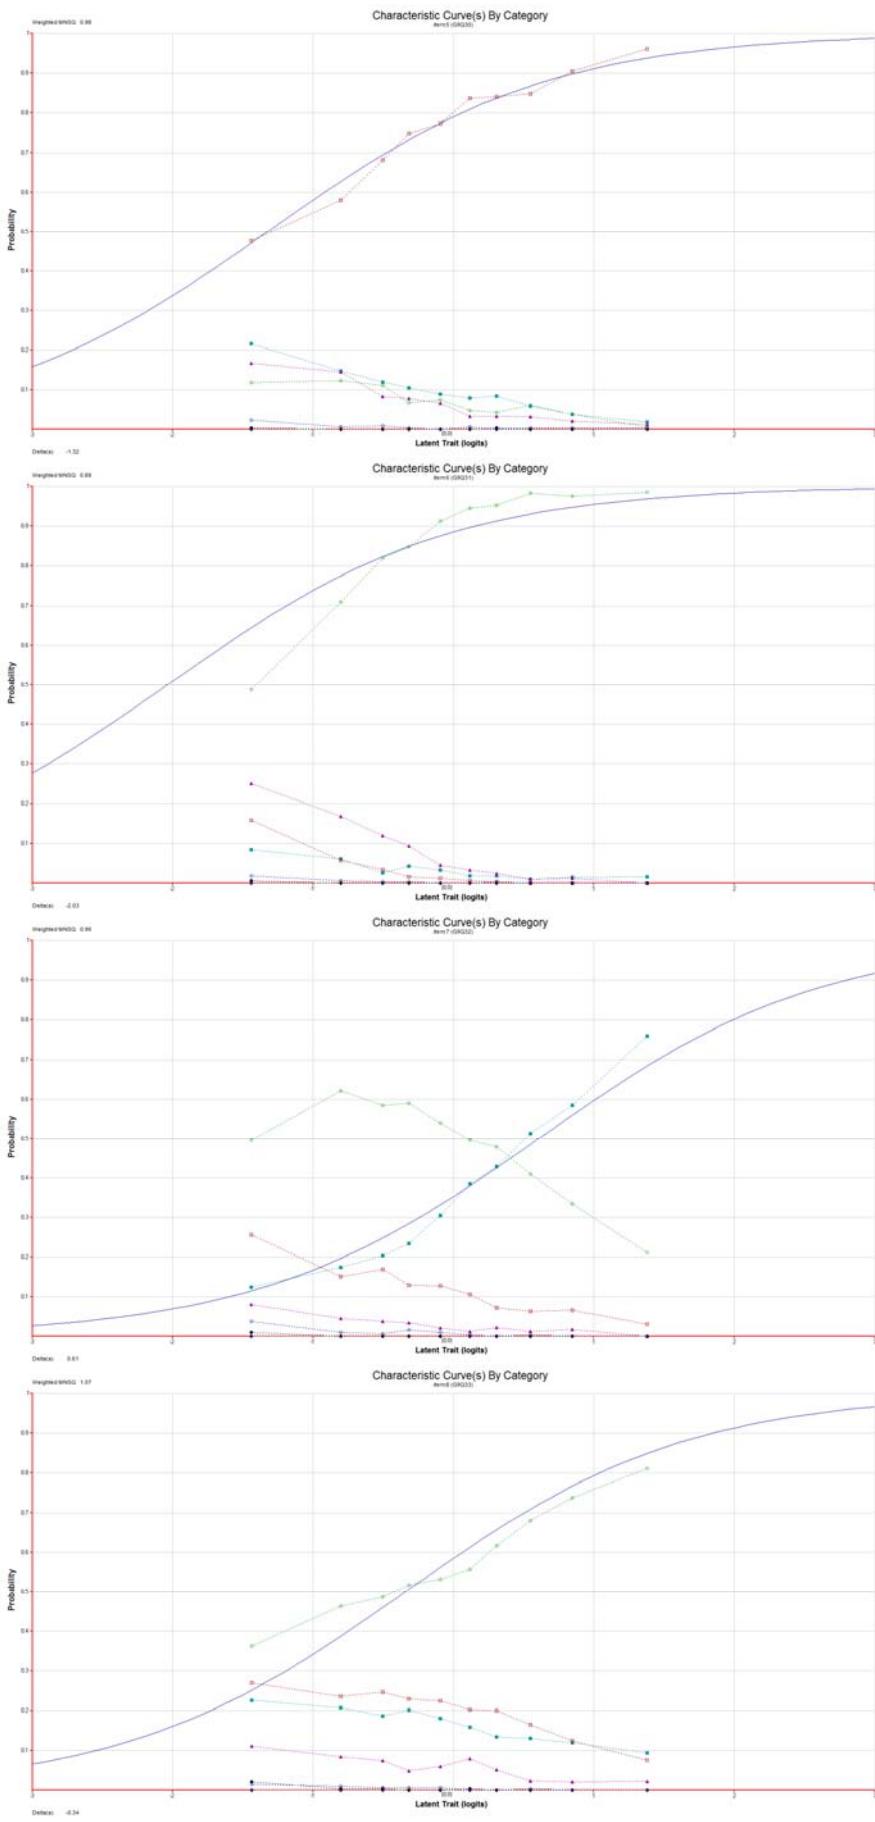

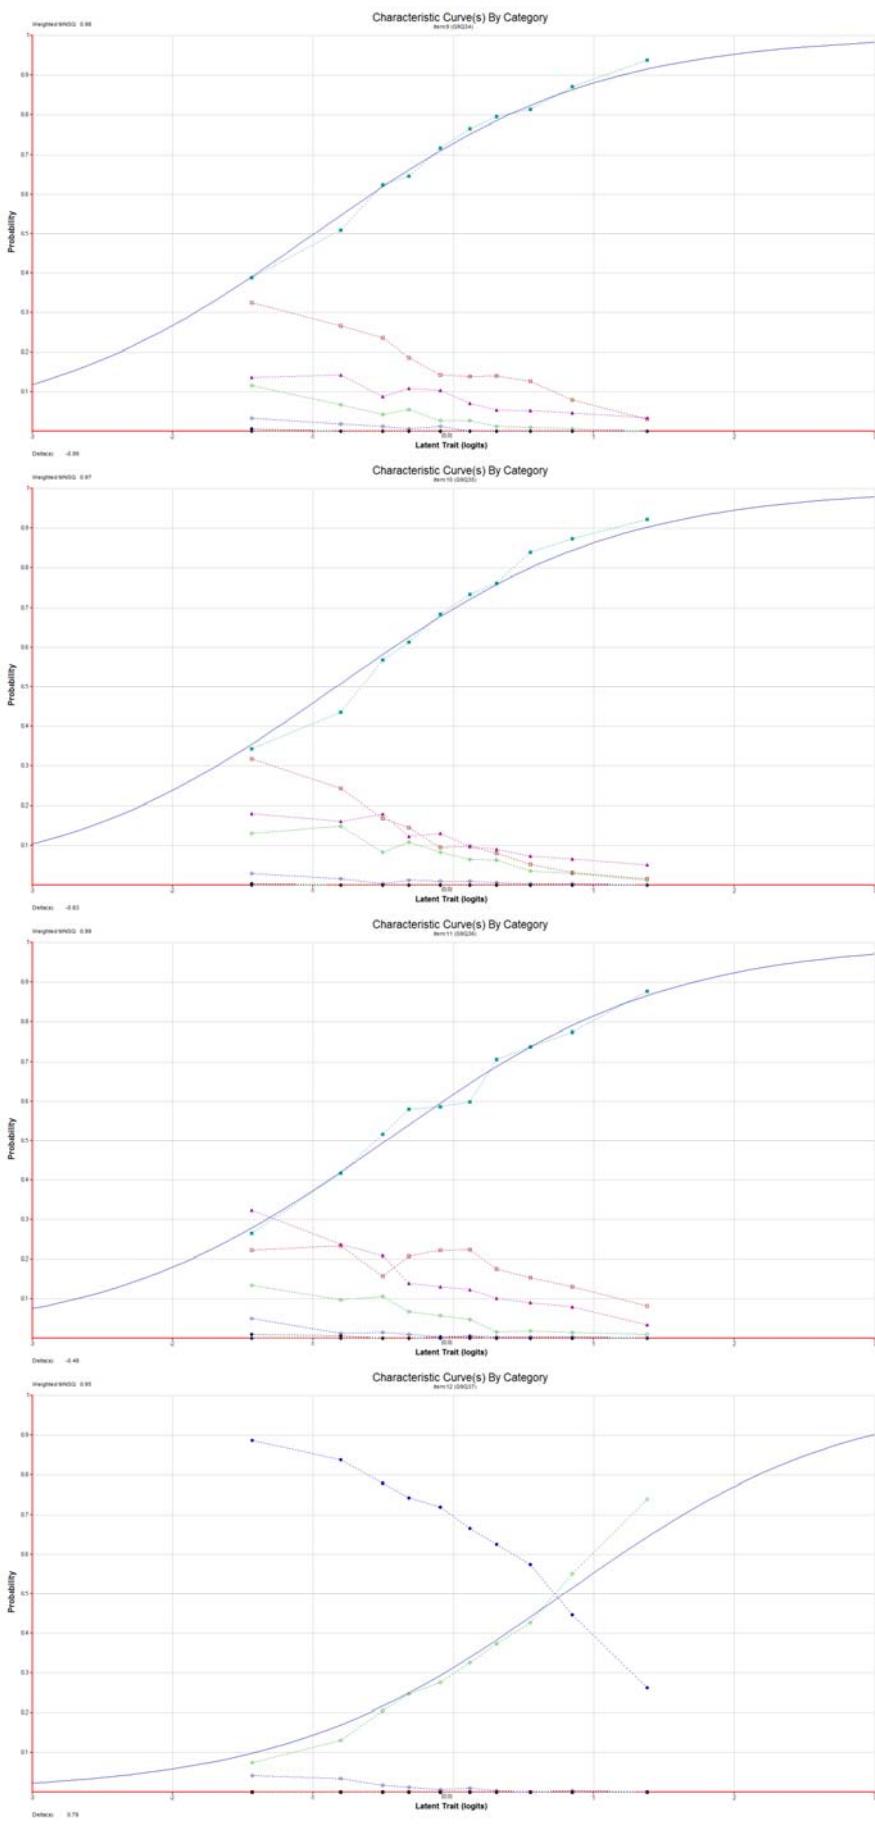

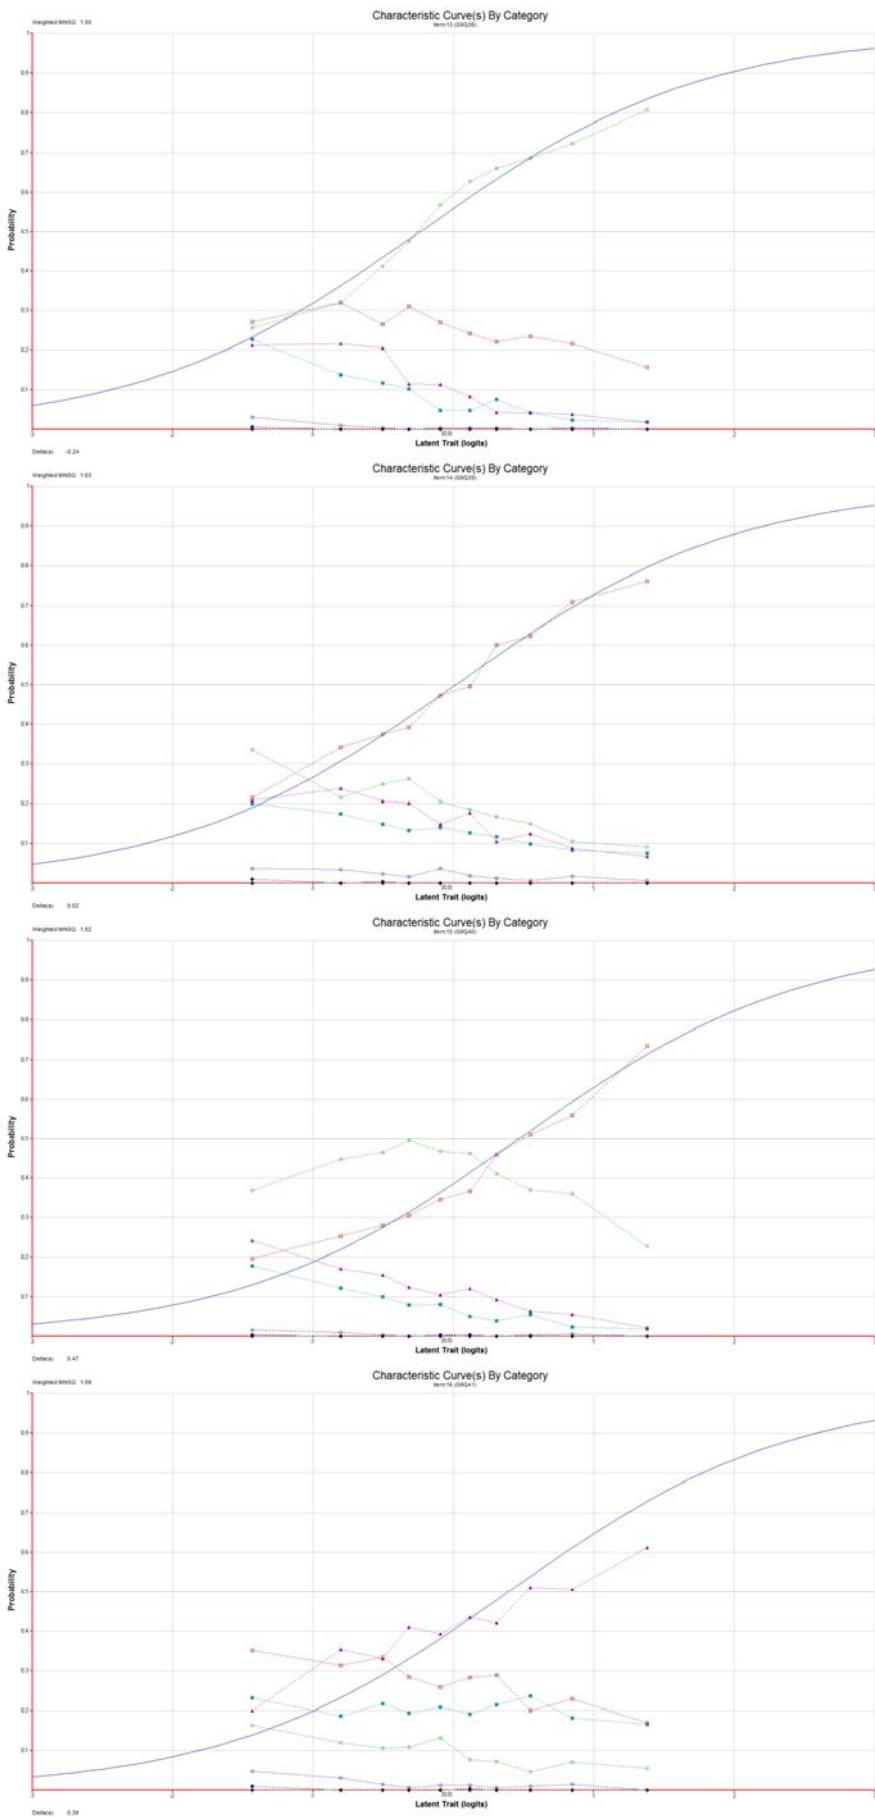

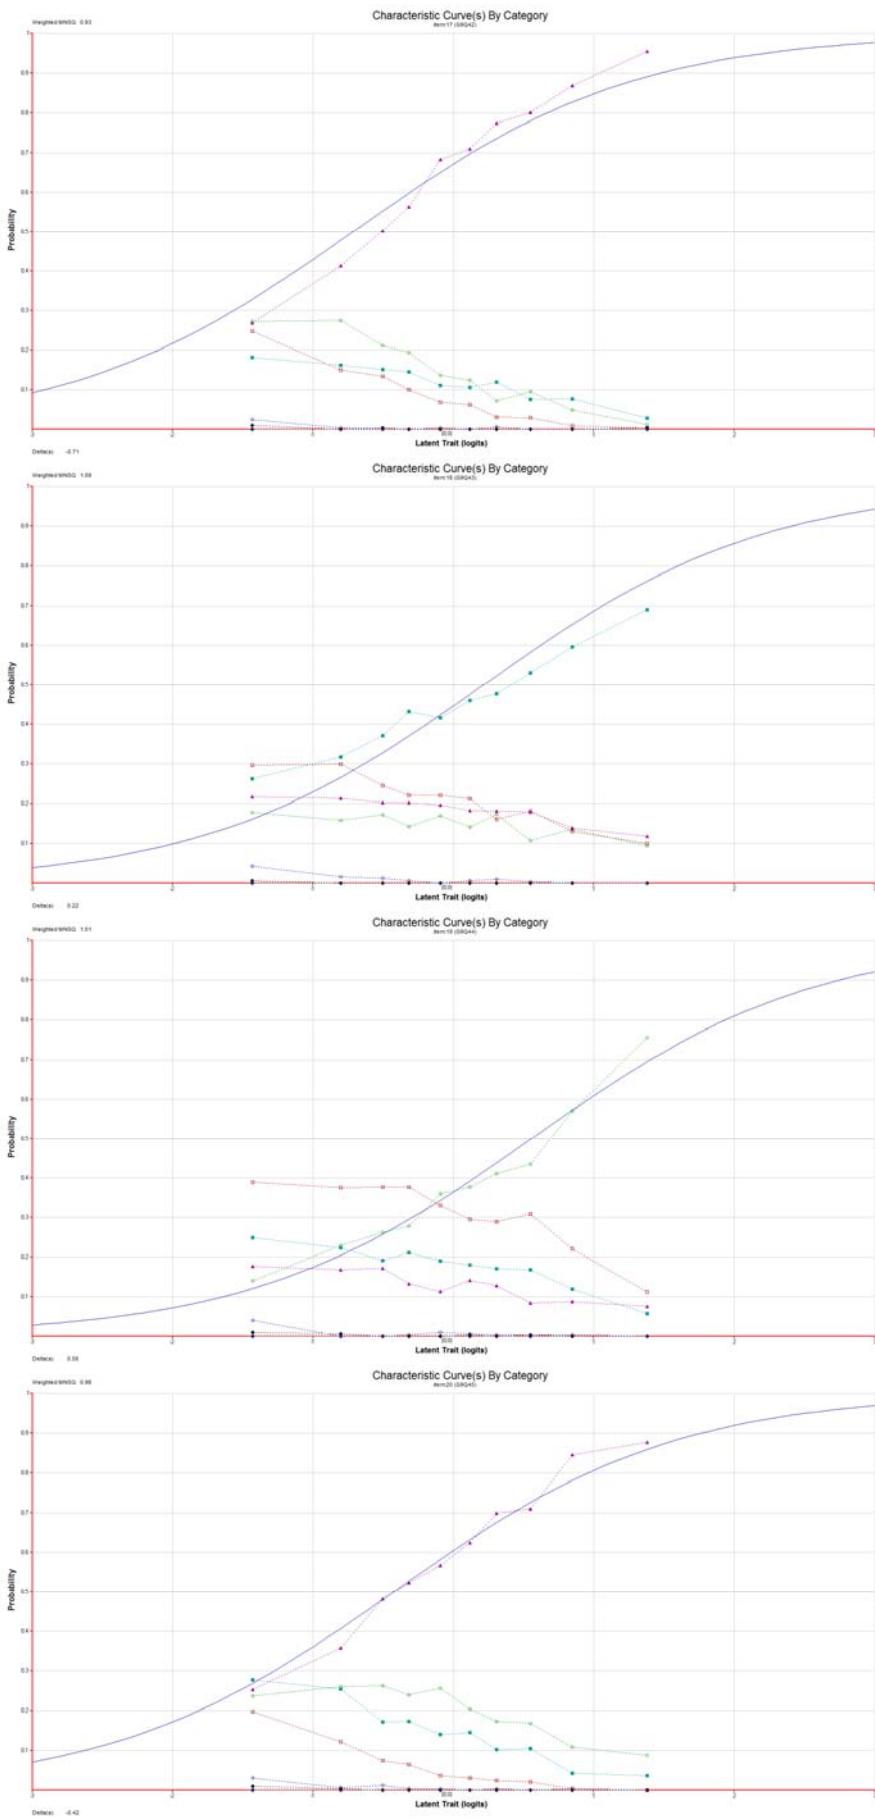

## D.12. Year 9 Grammar and Punctuation

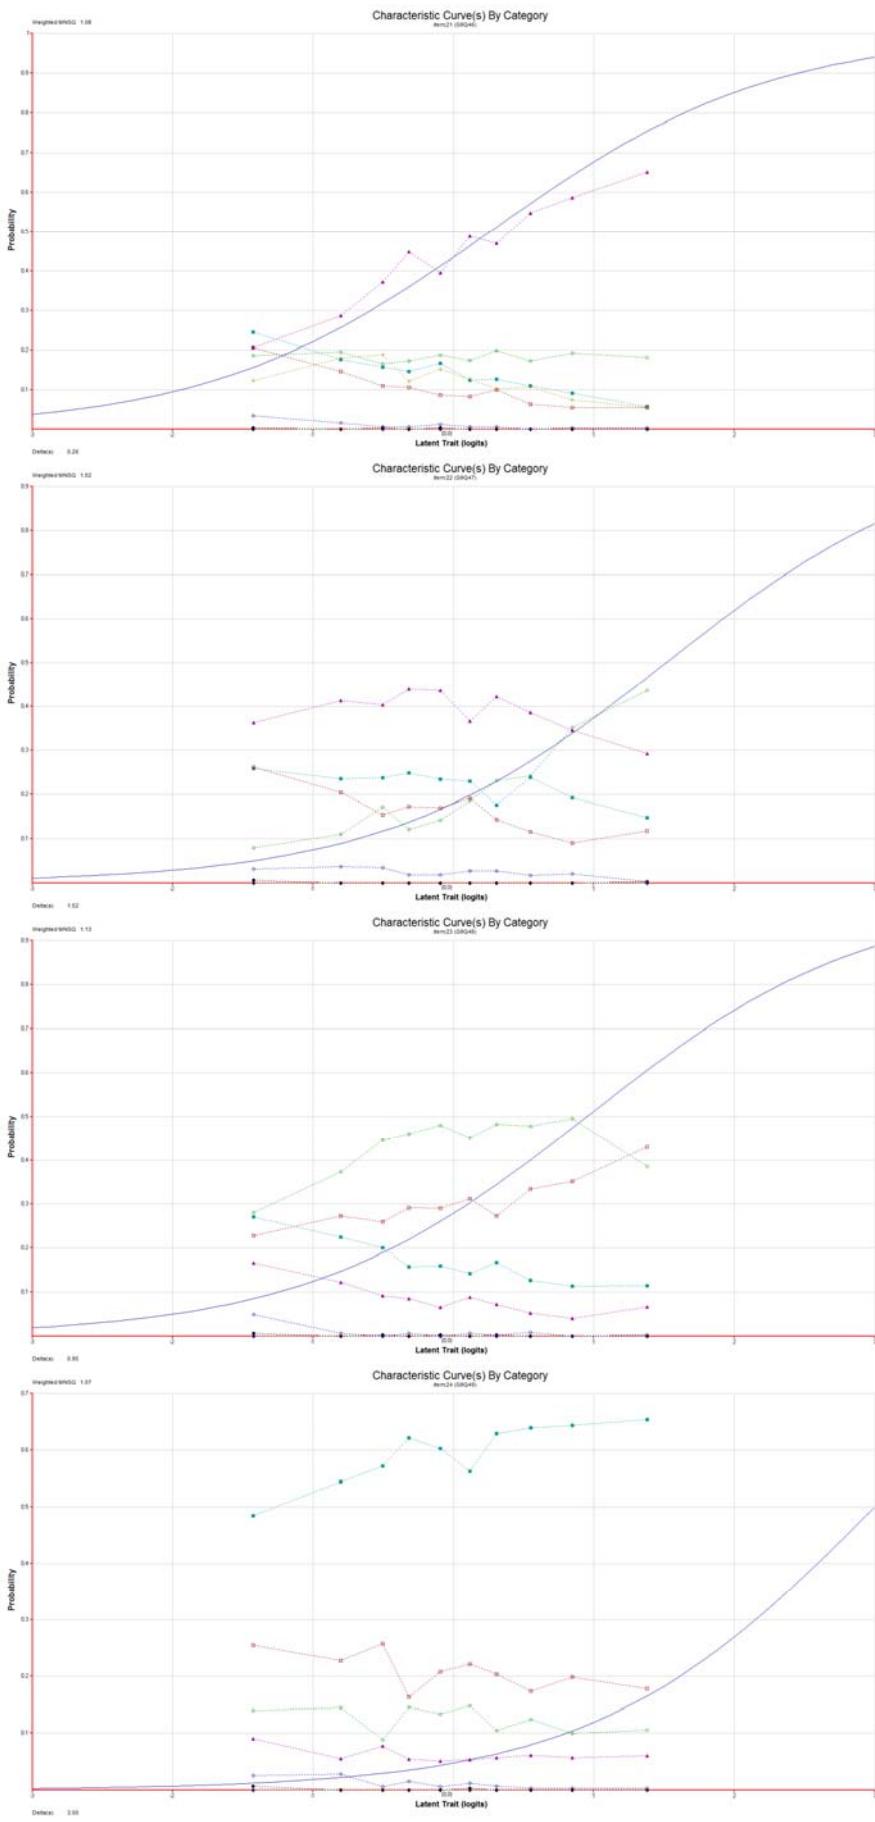

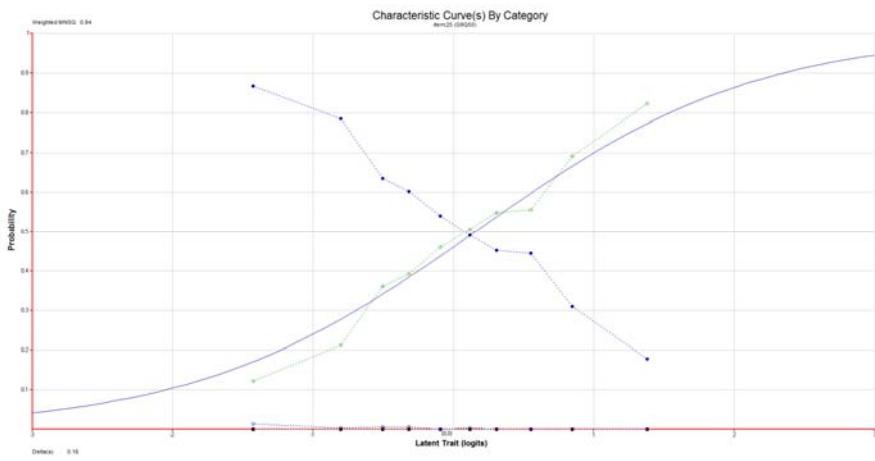

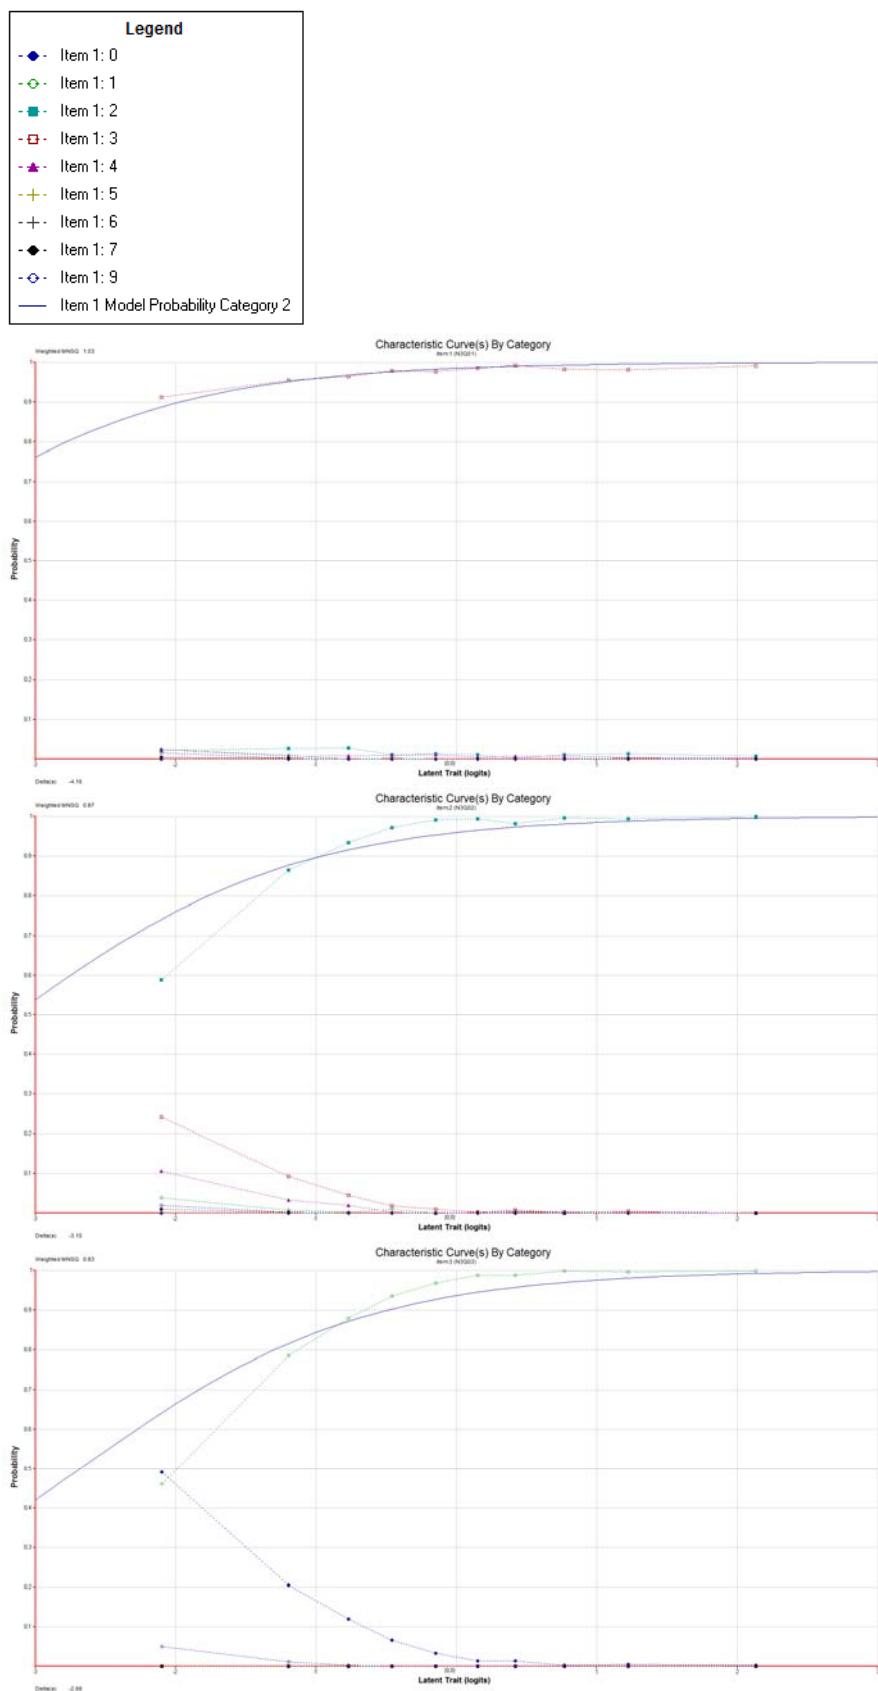

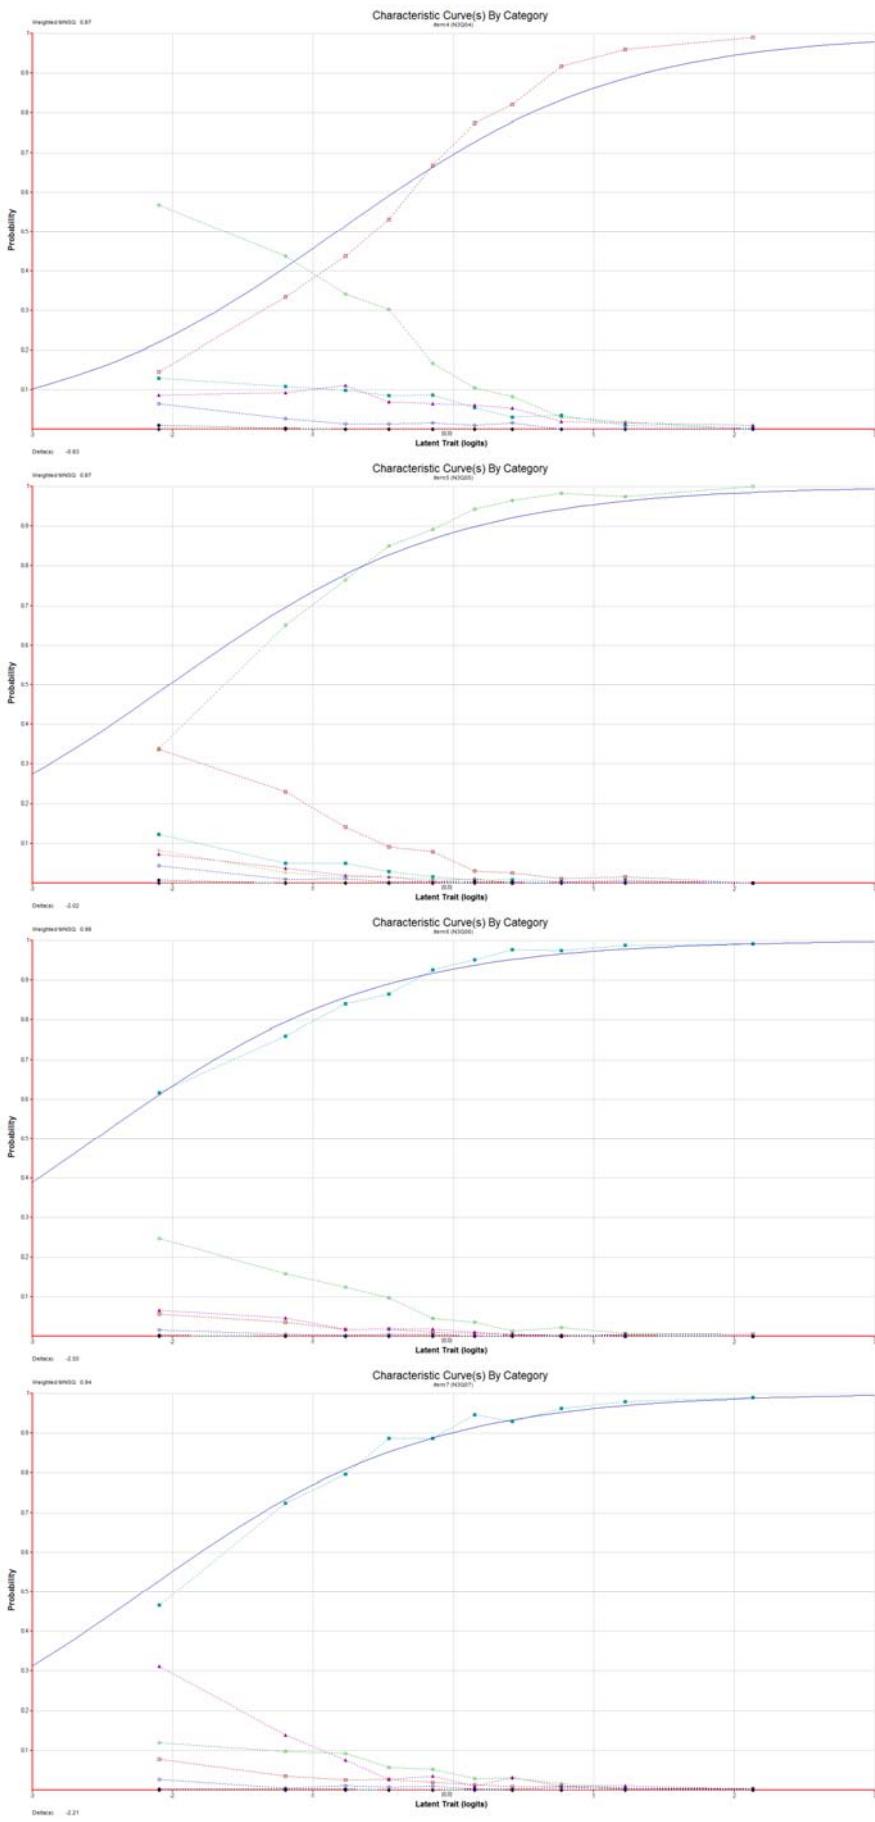

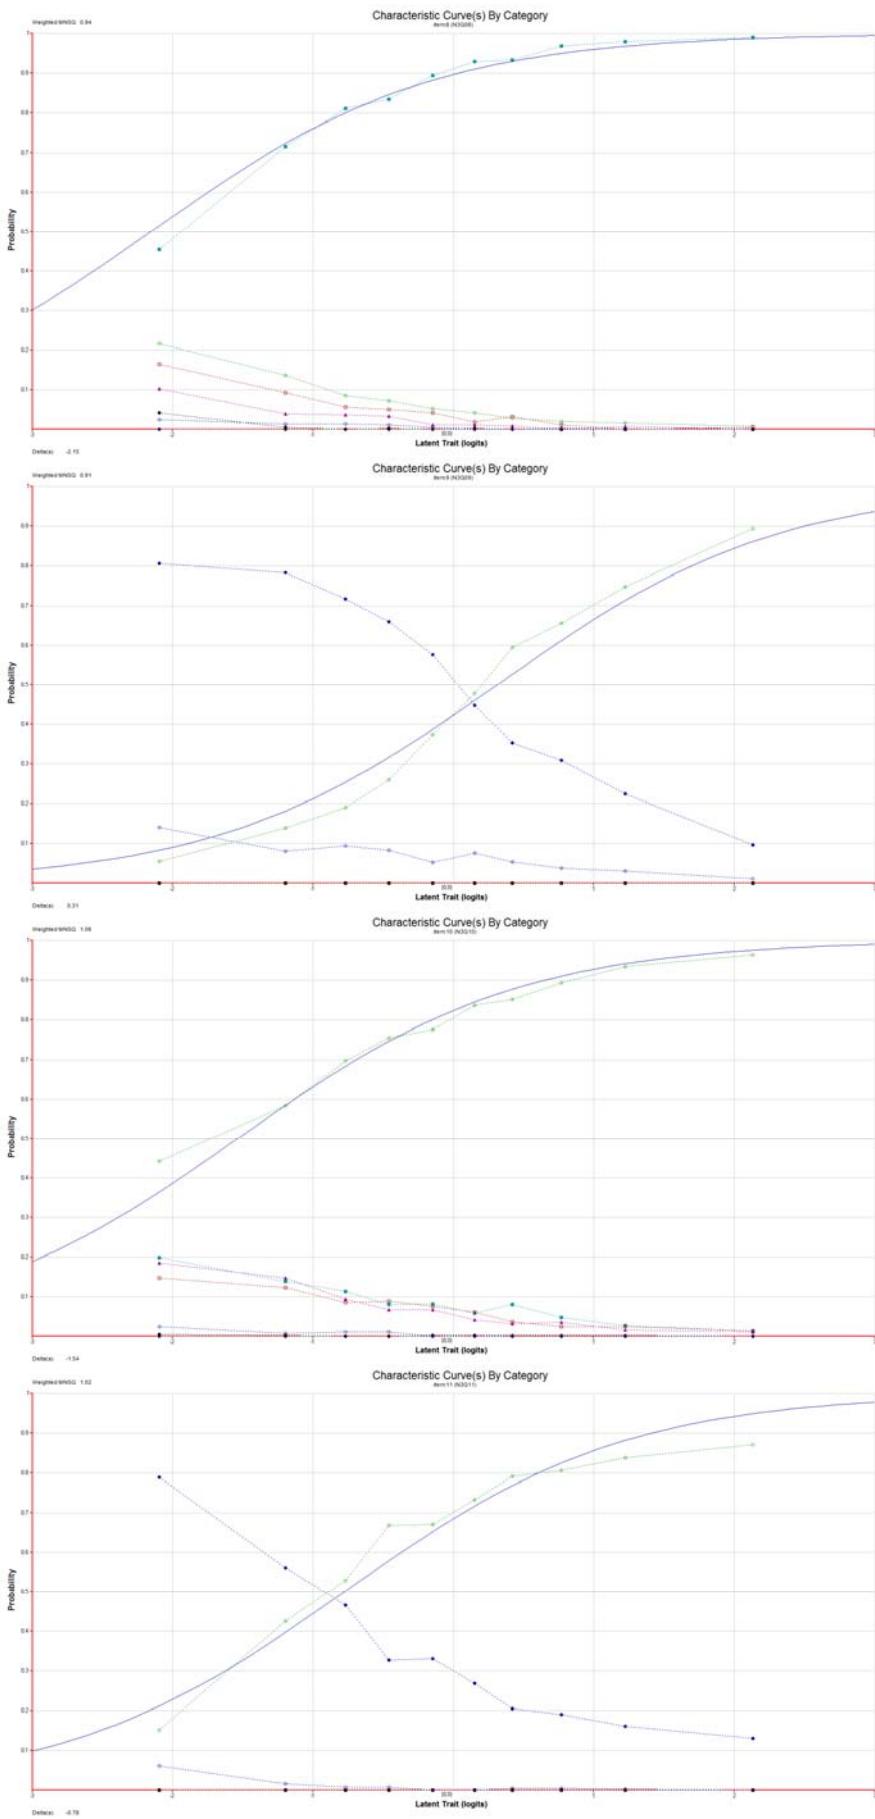

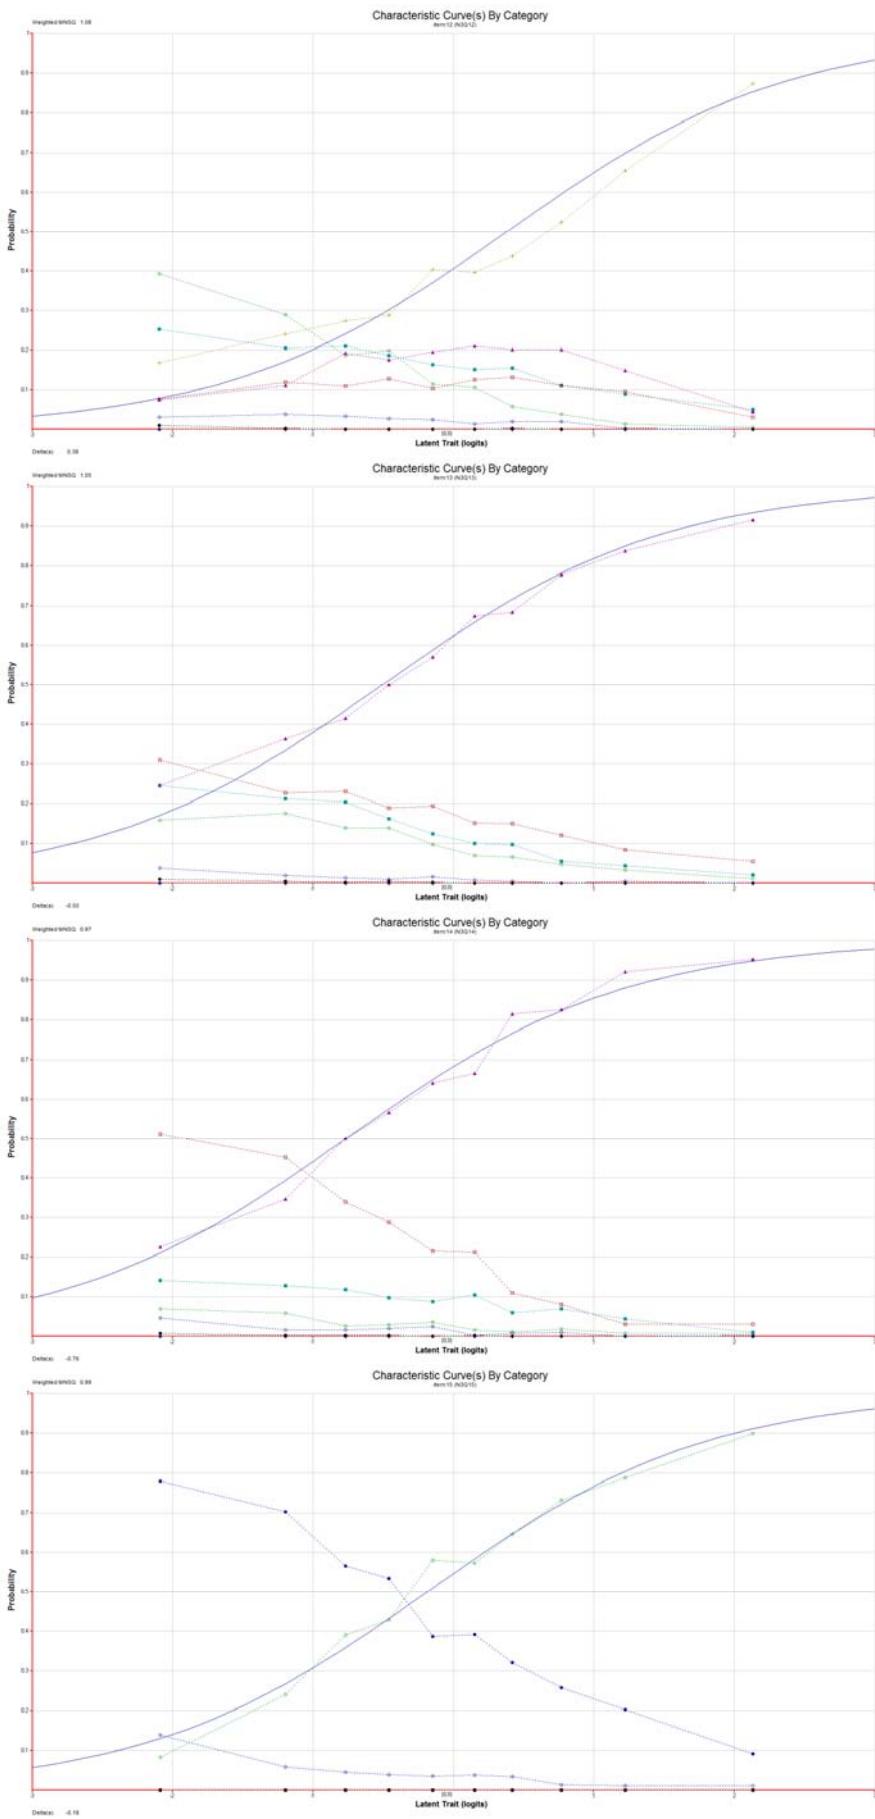

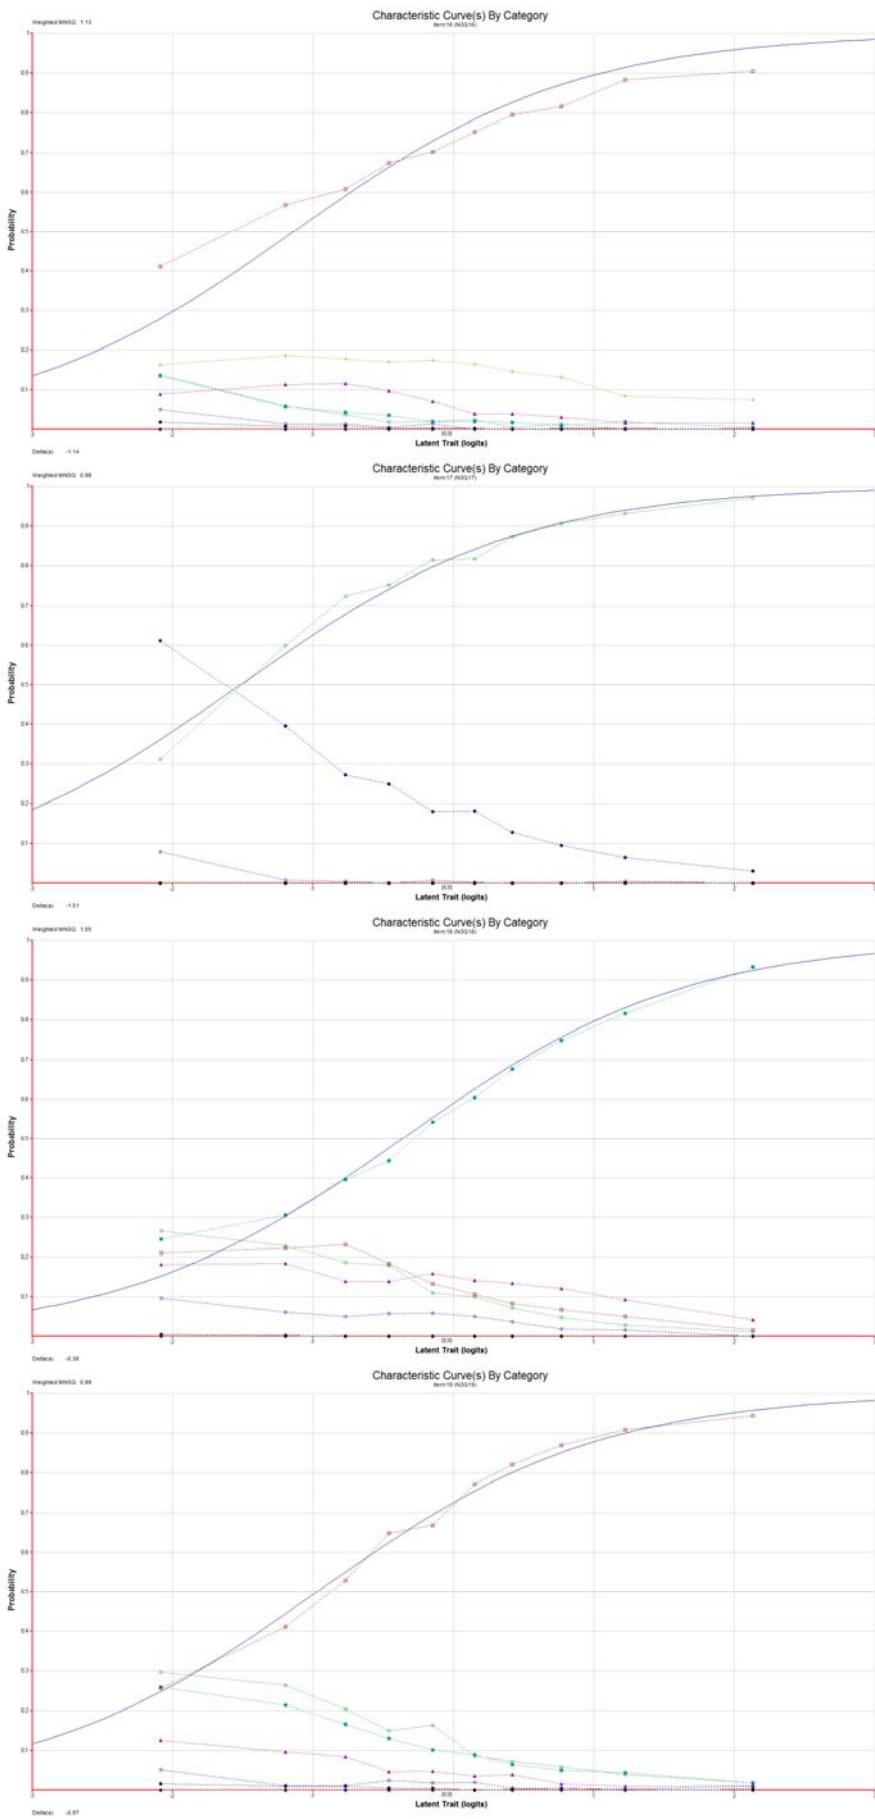

### D.13. Year 3 Numeracy

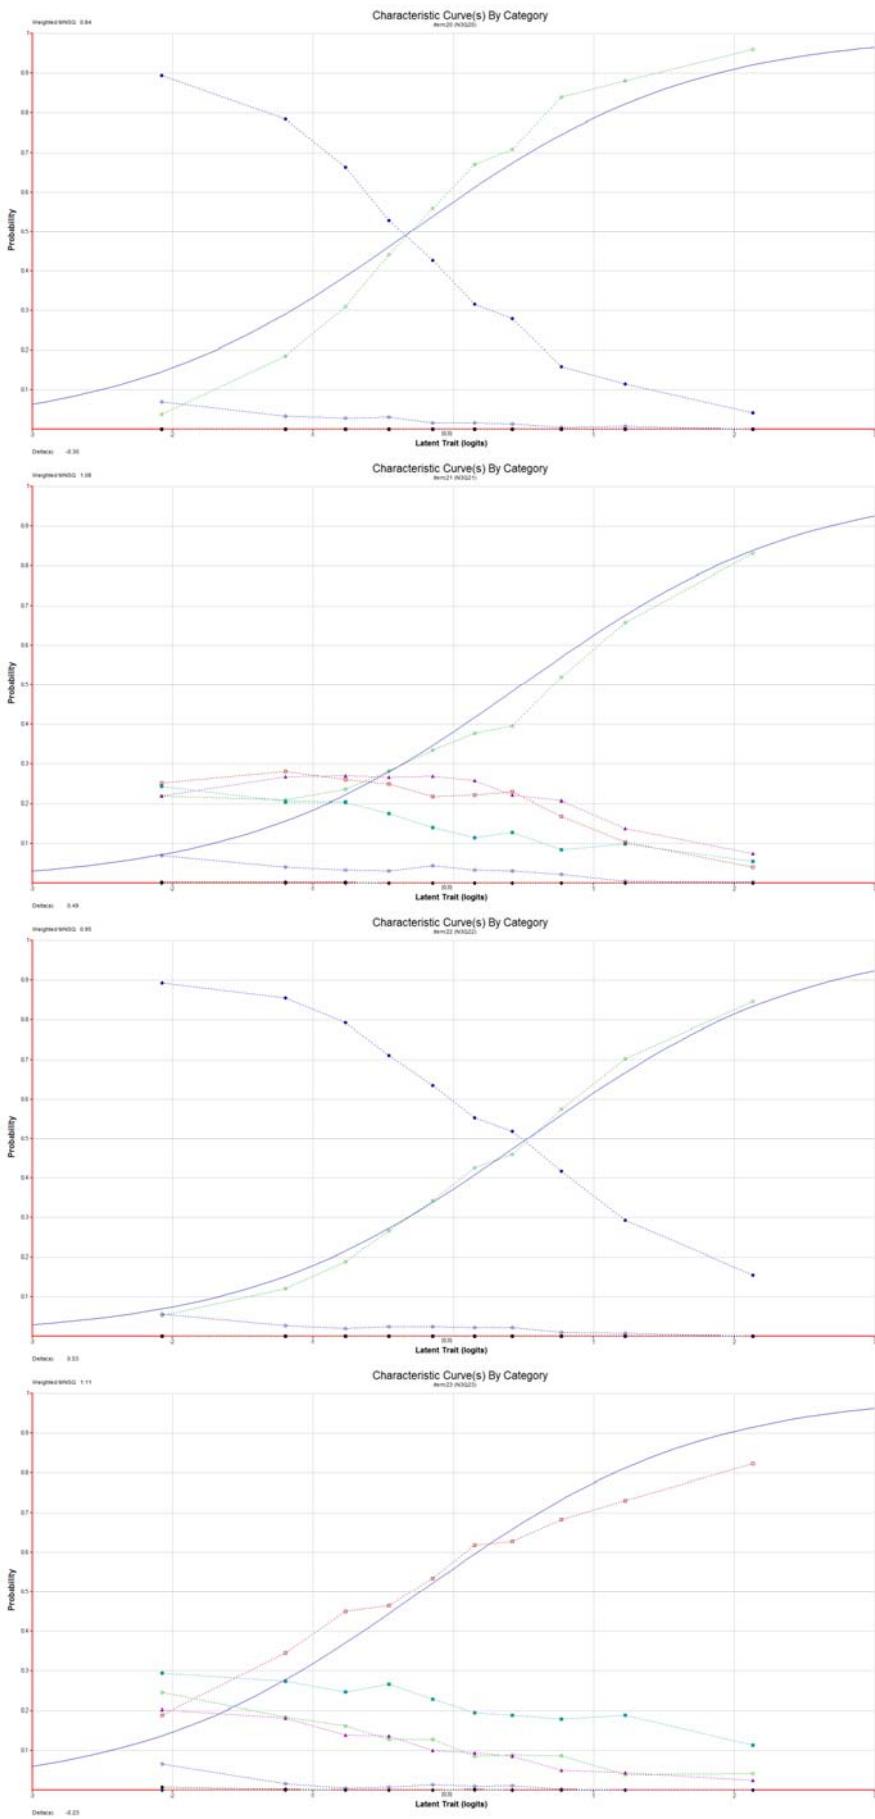

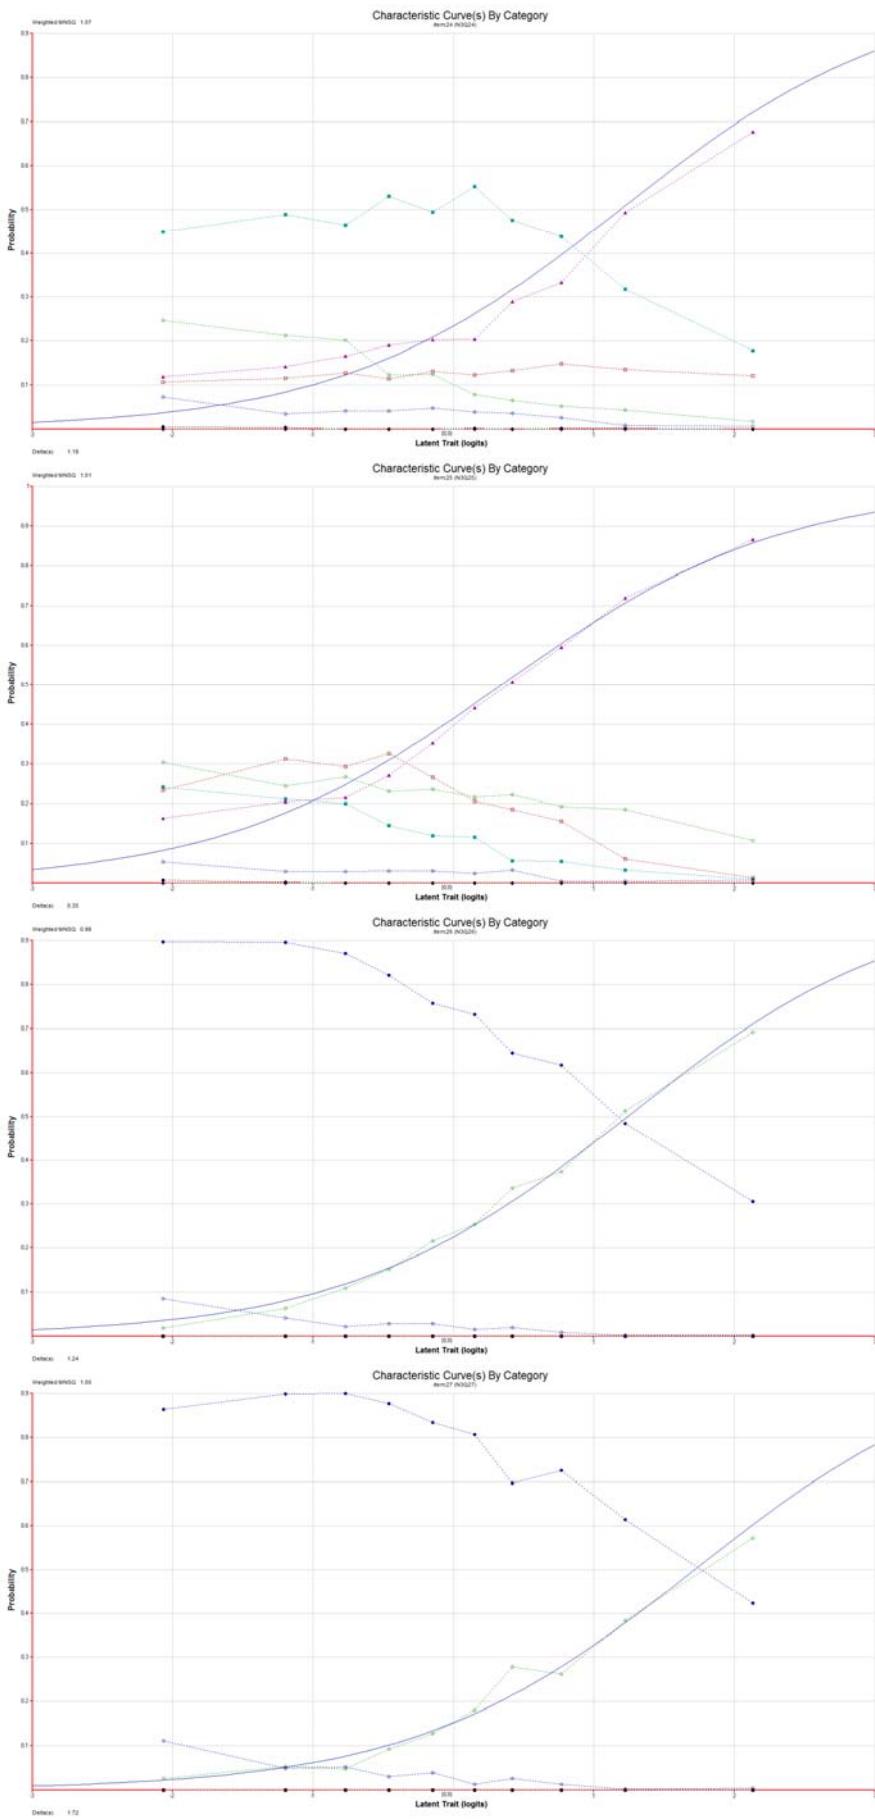

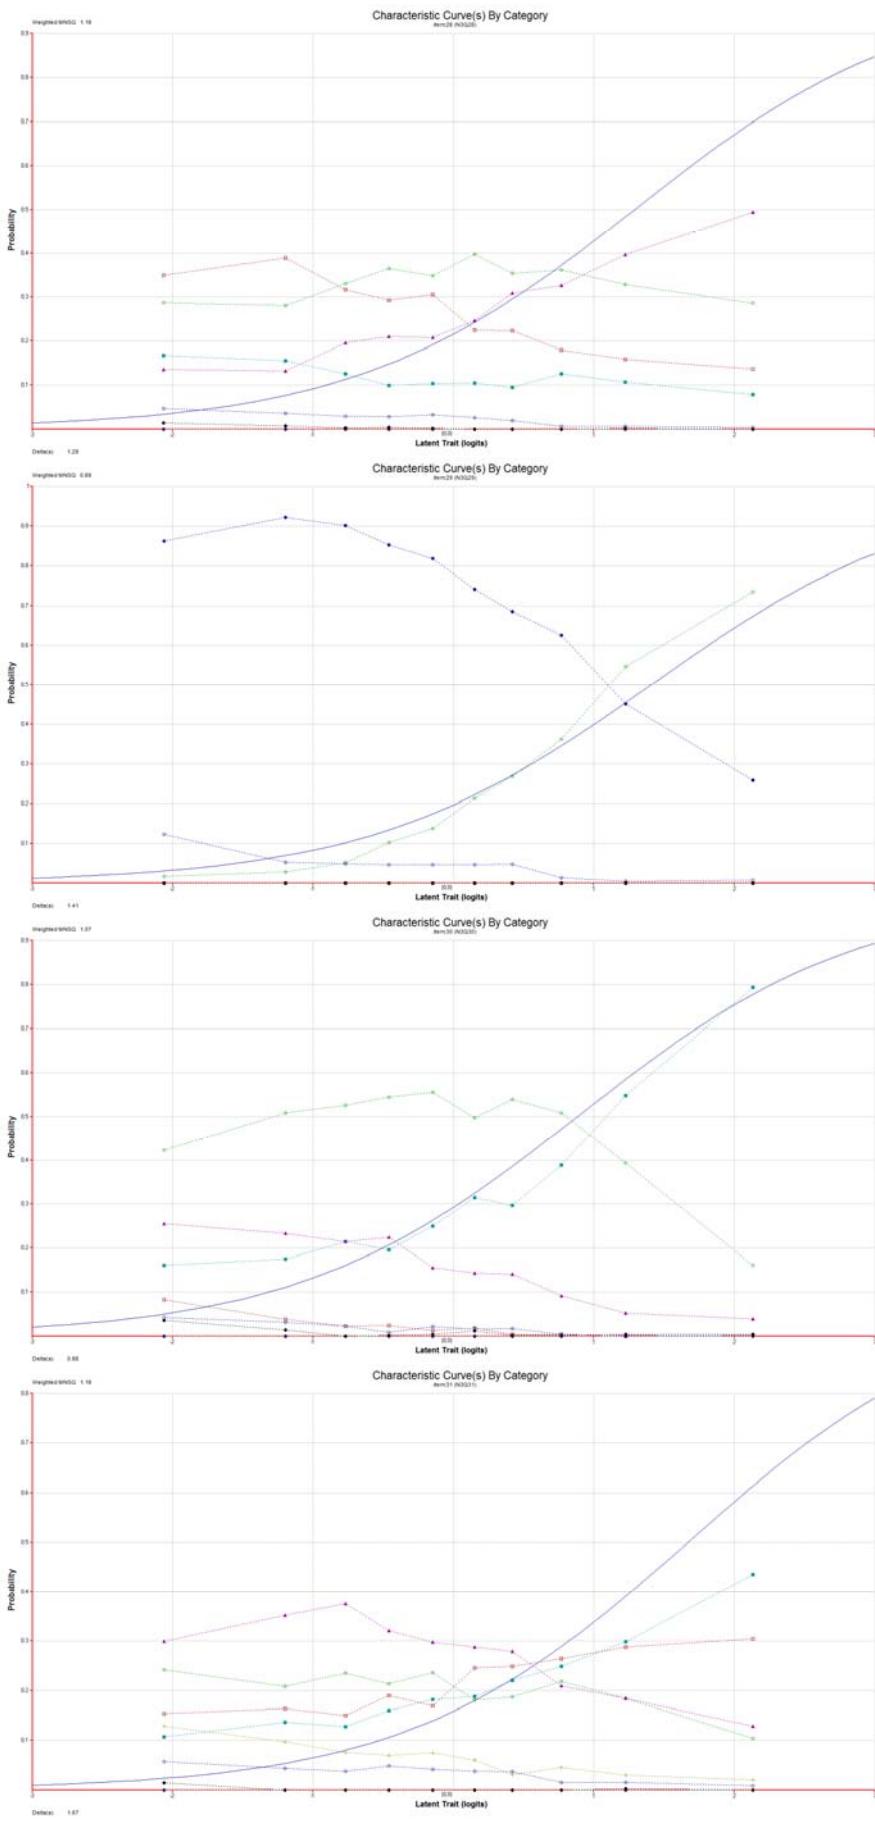

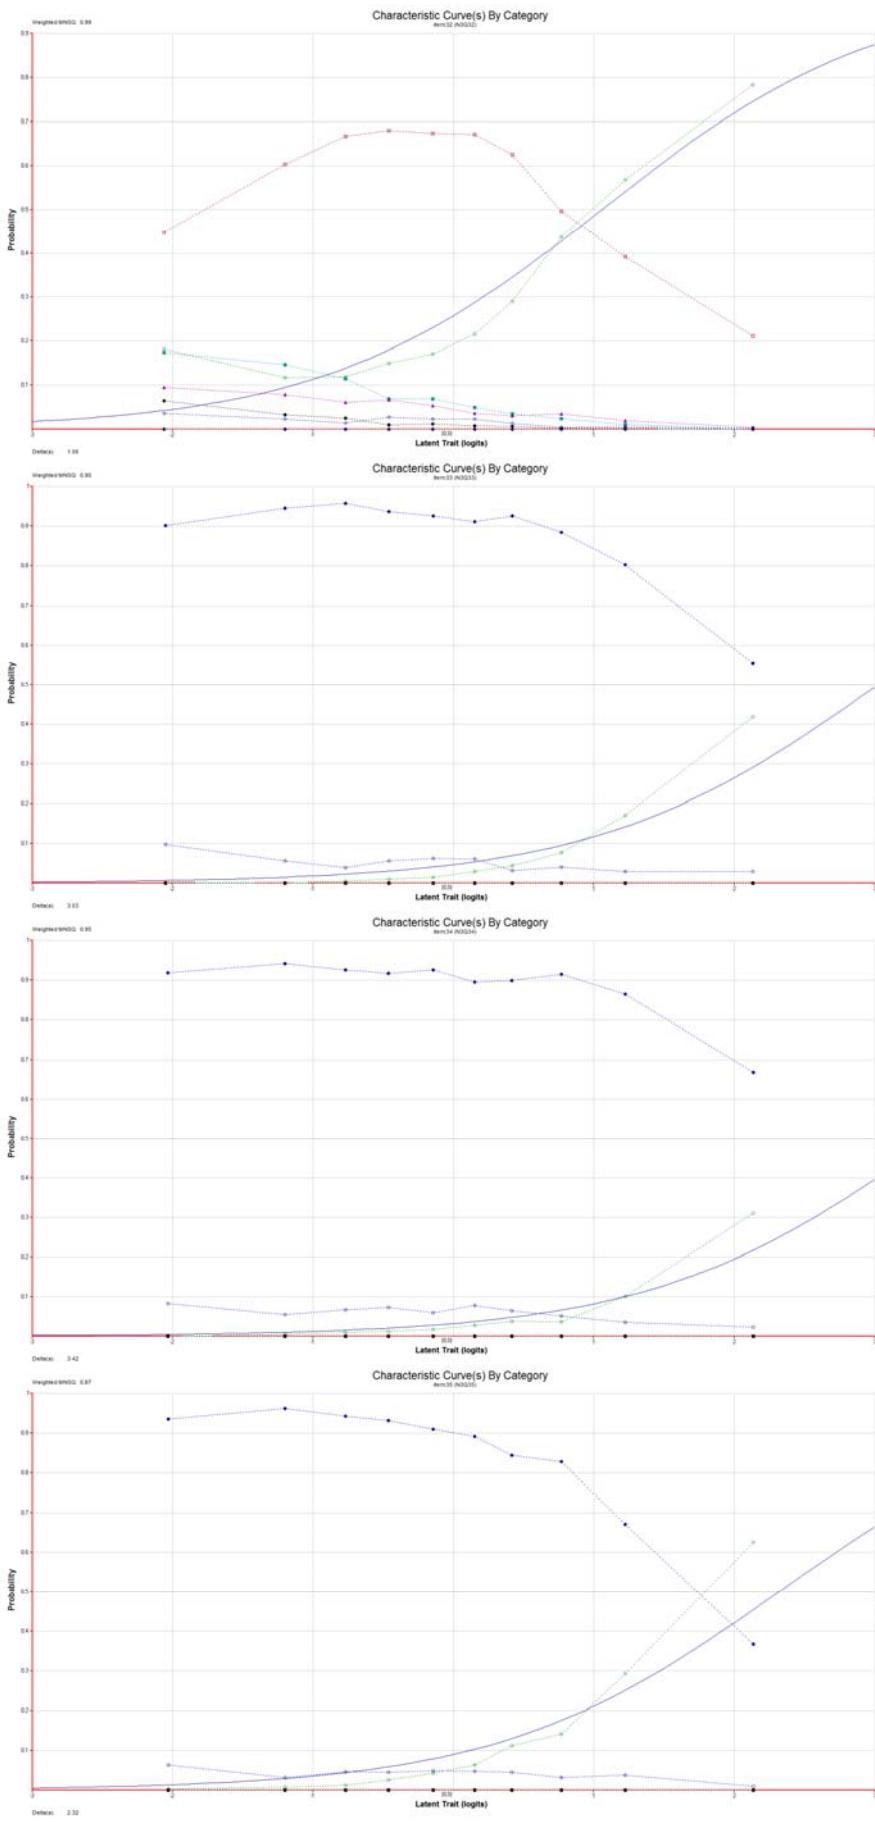

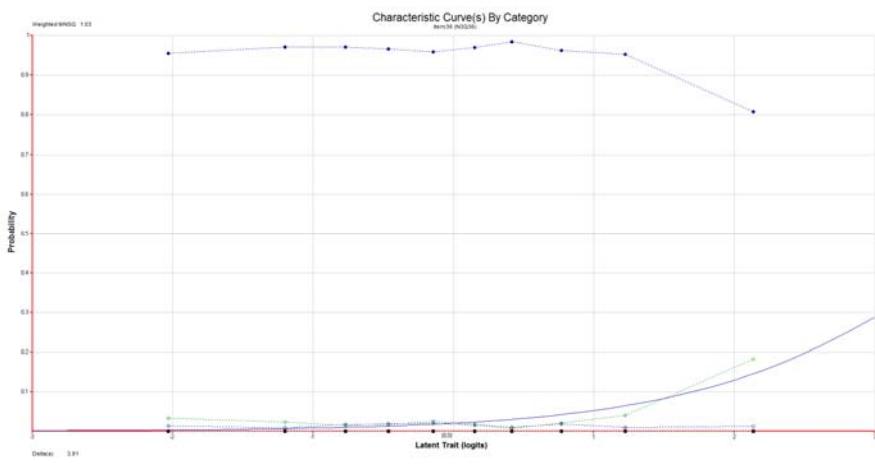

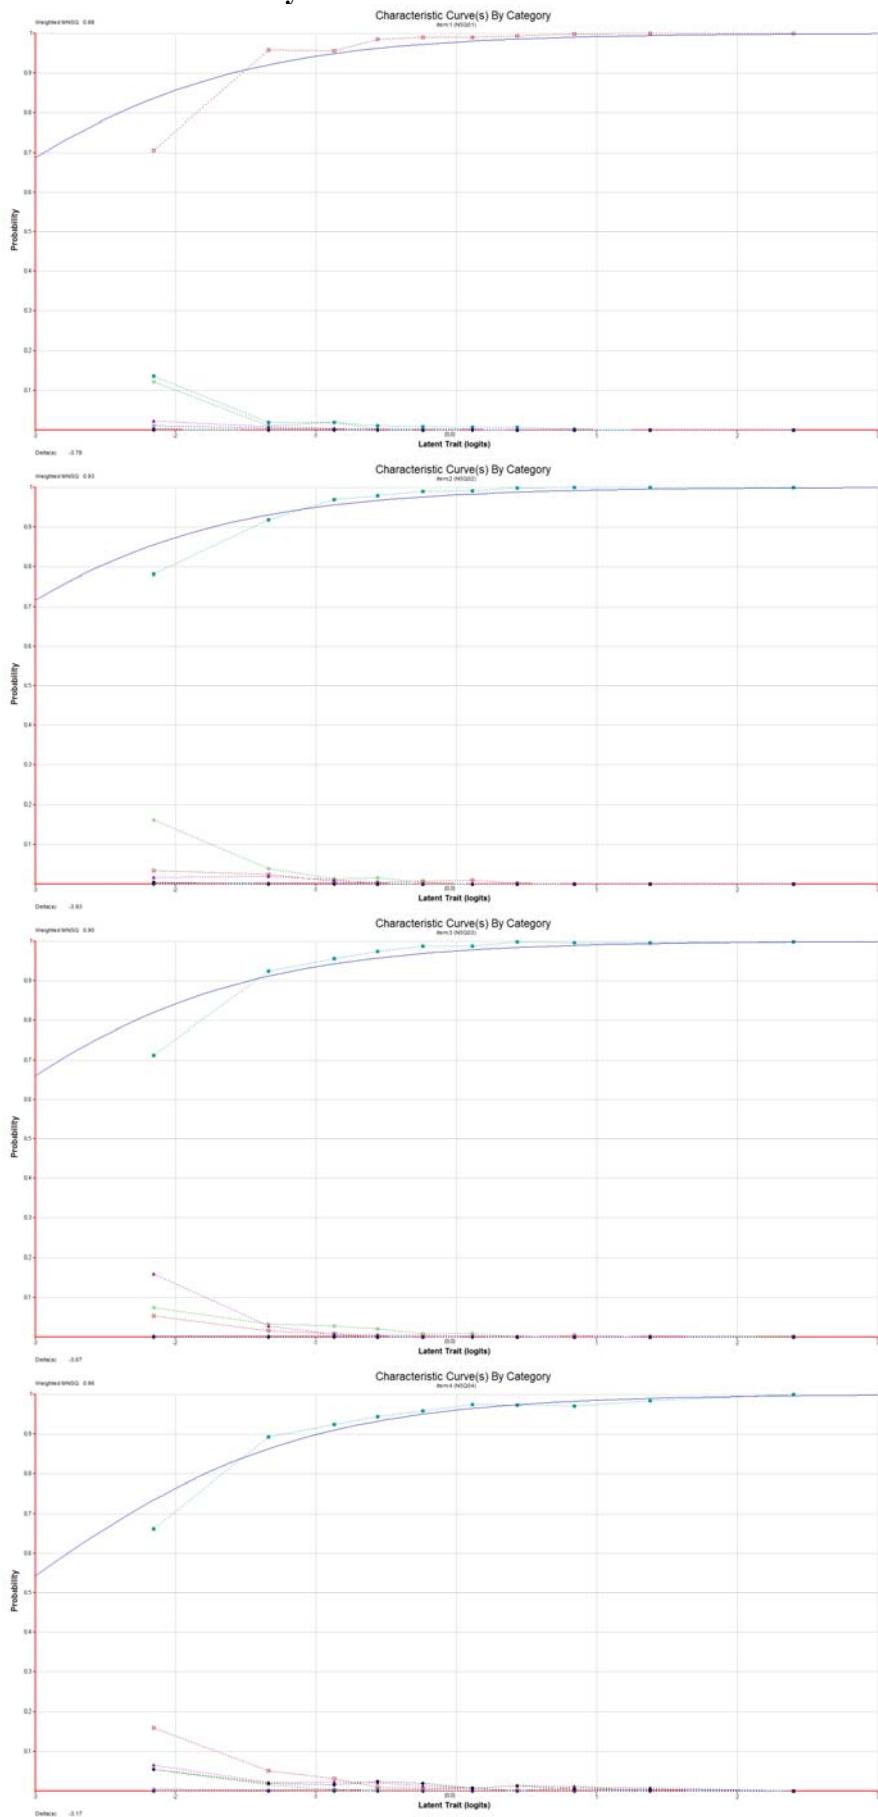

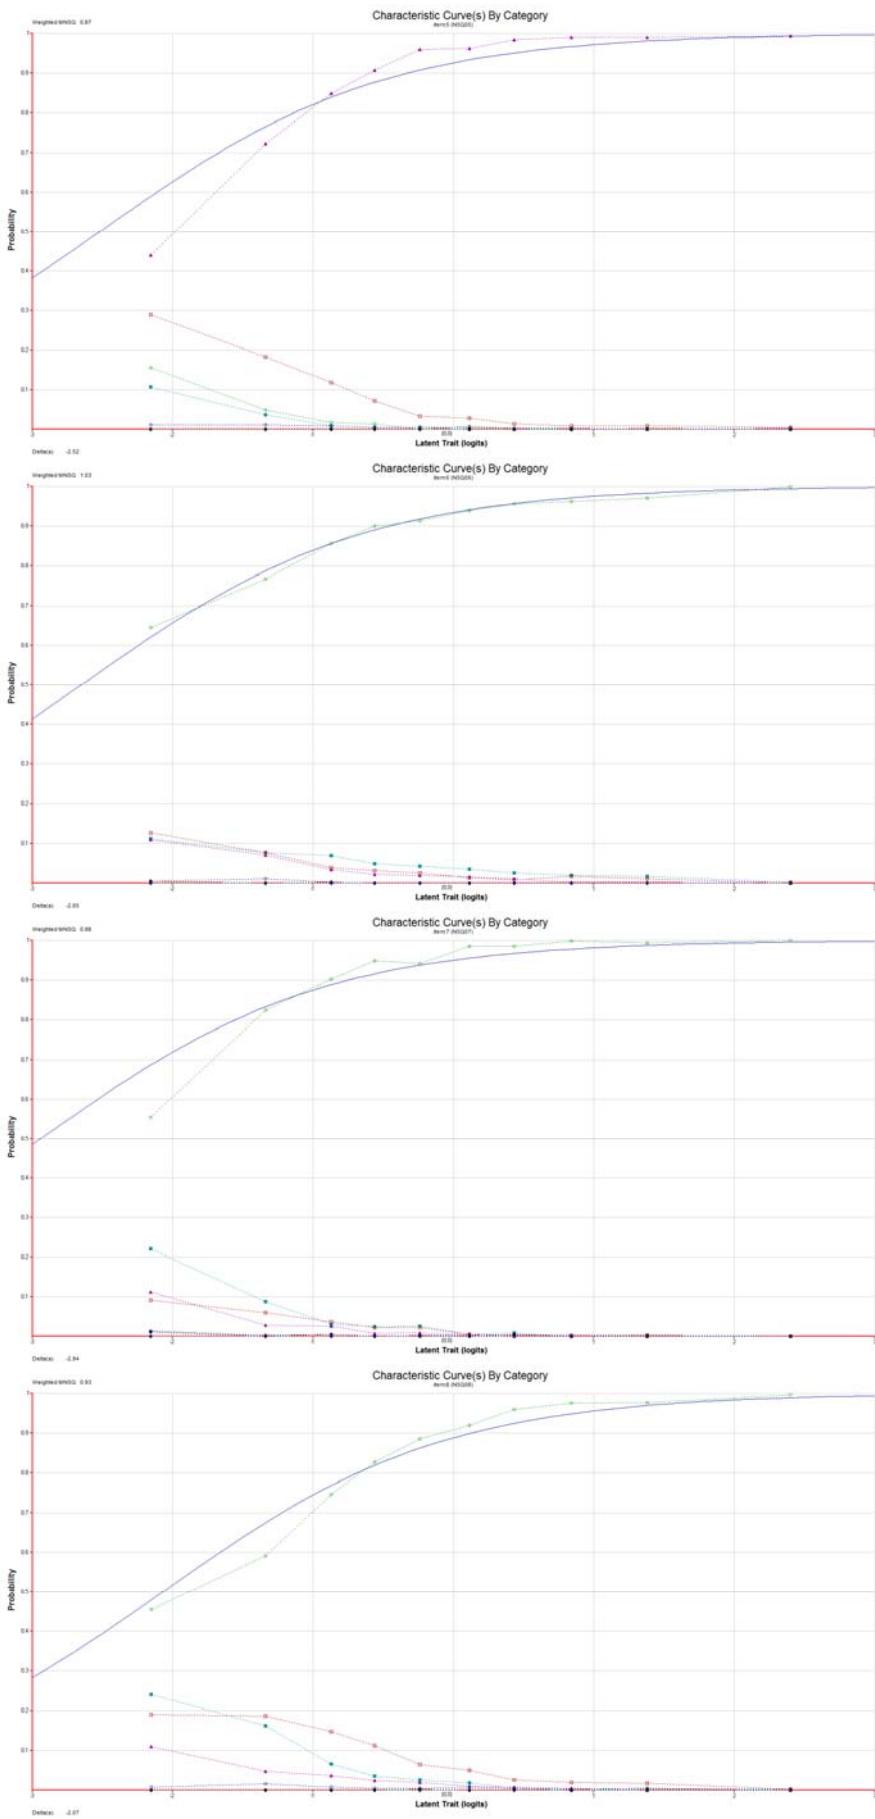

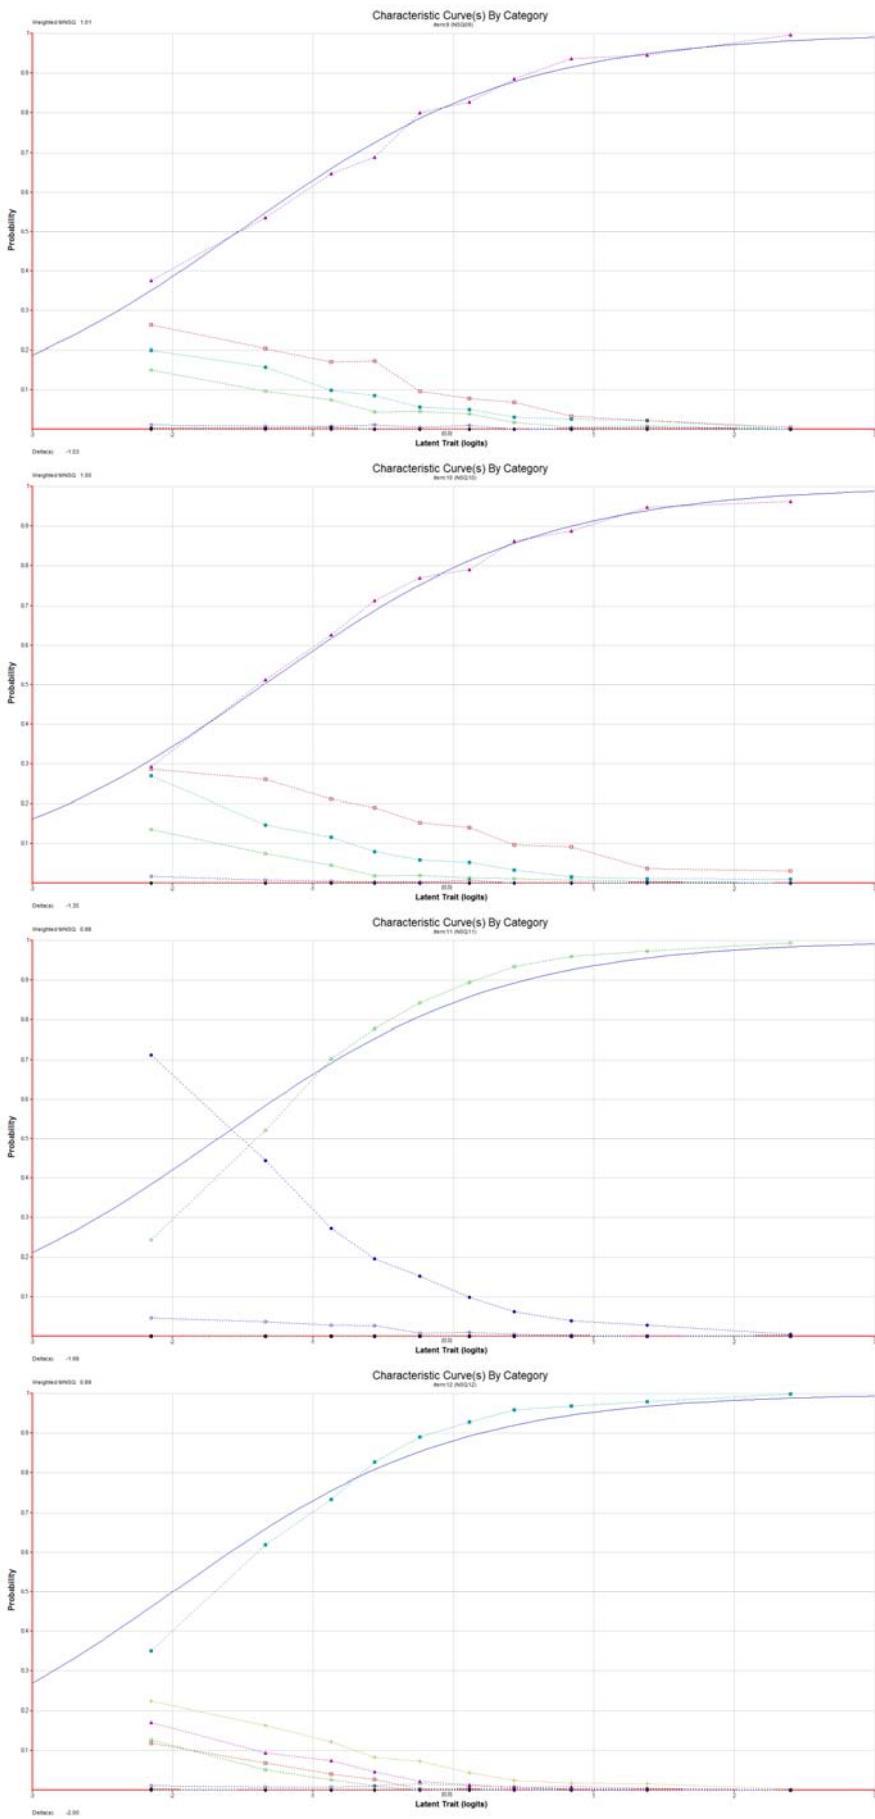

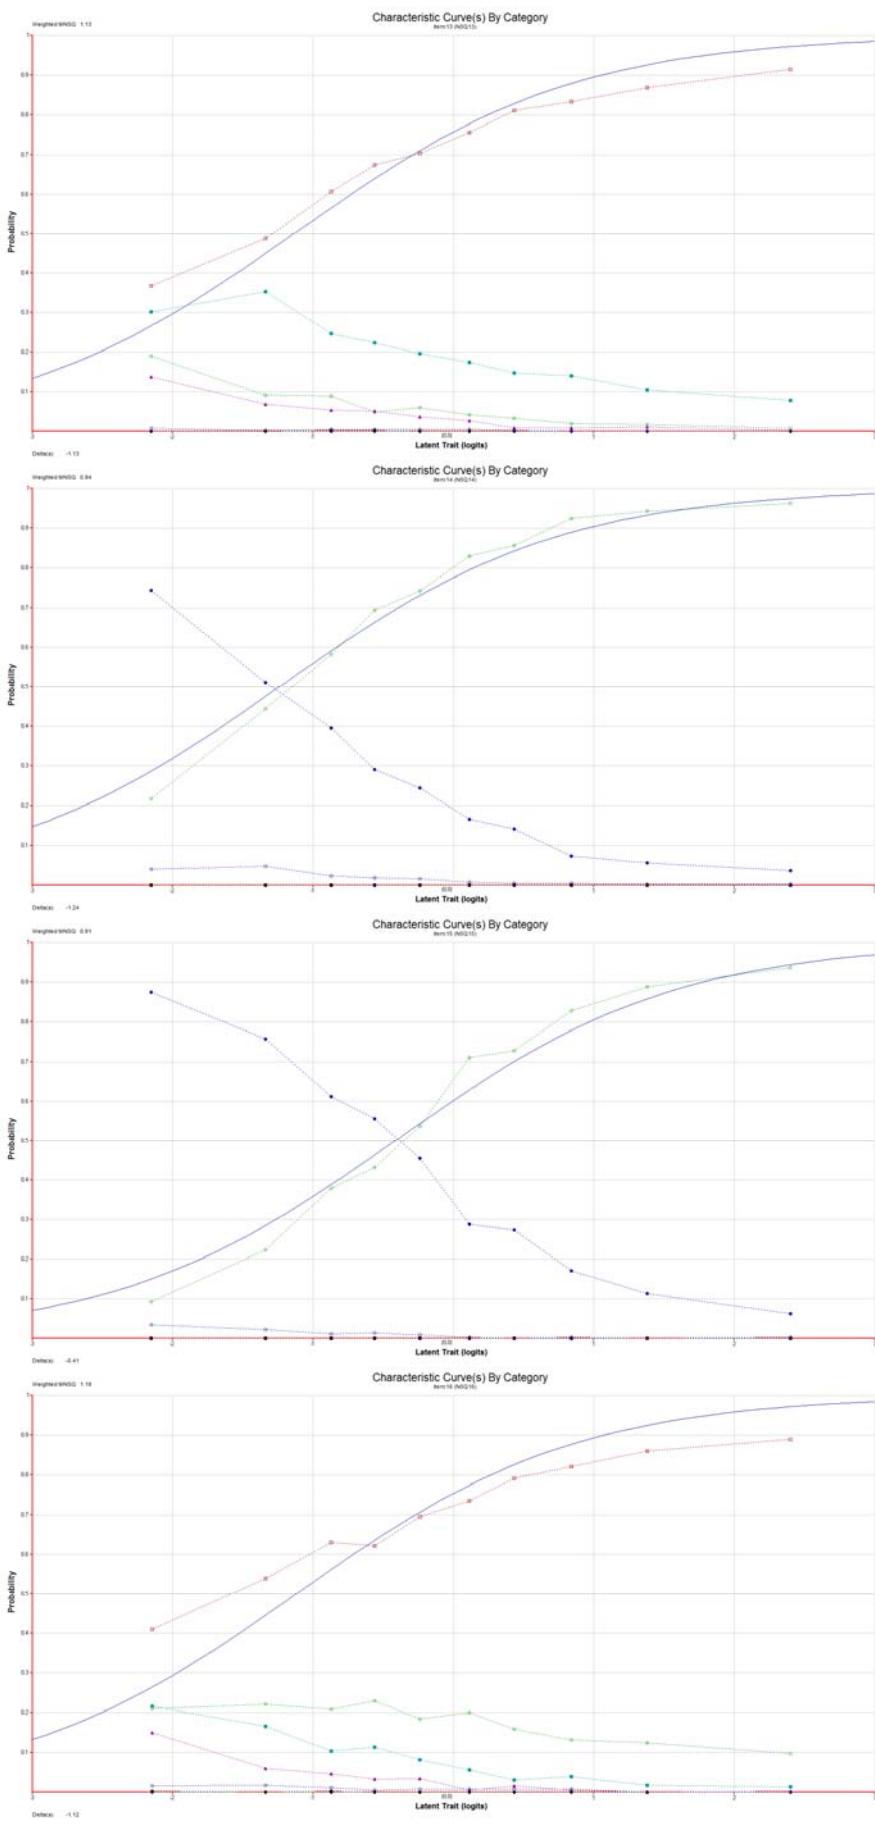

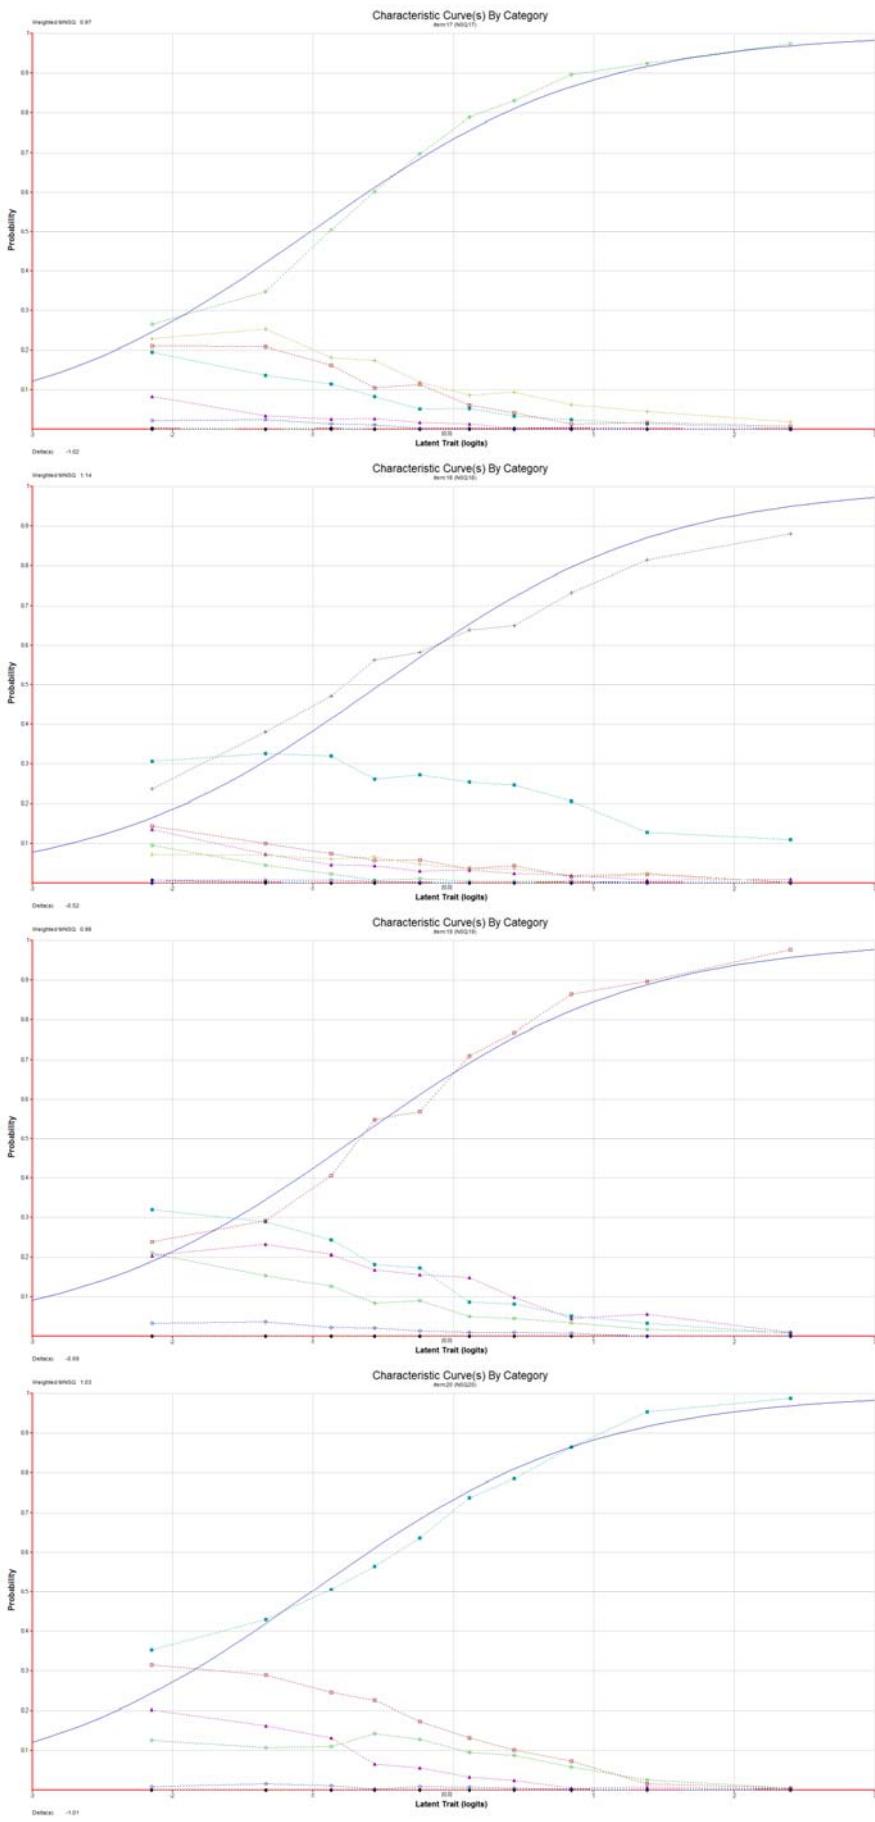

## D.14. Year 5 Numeracy

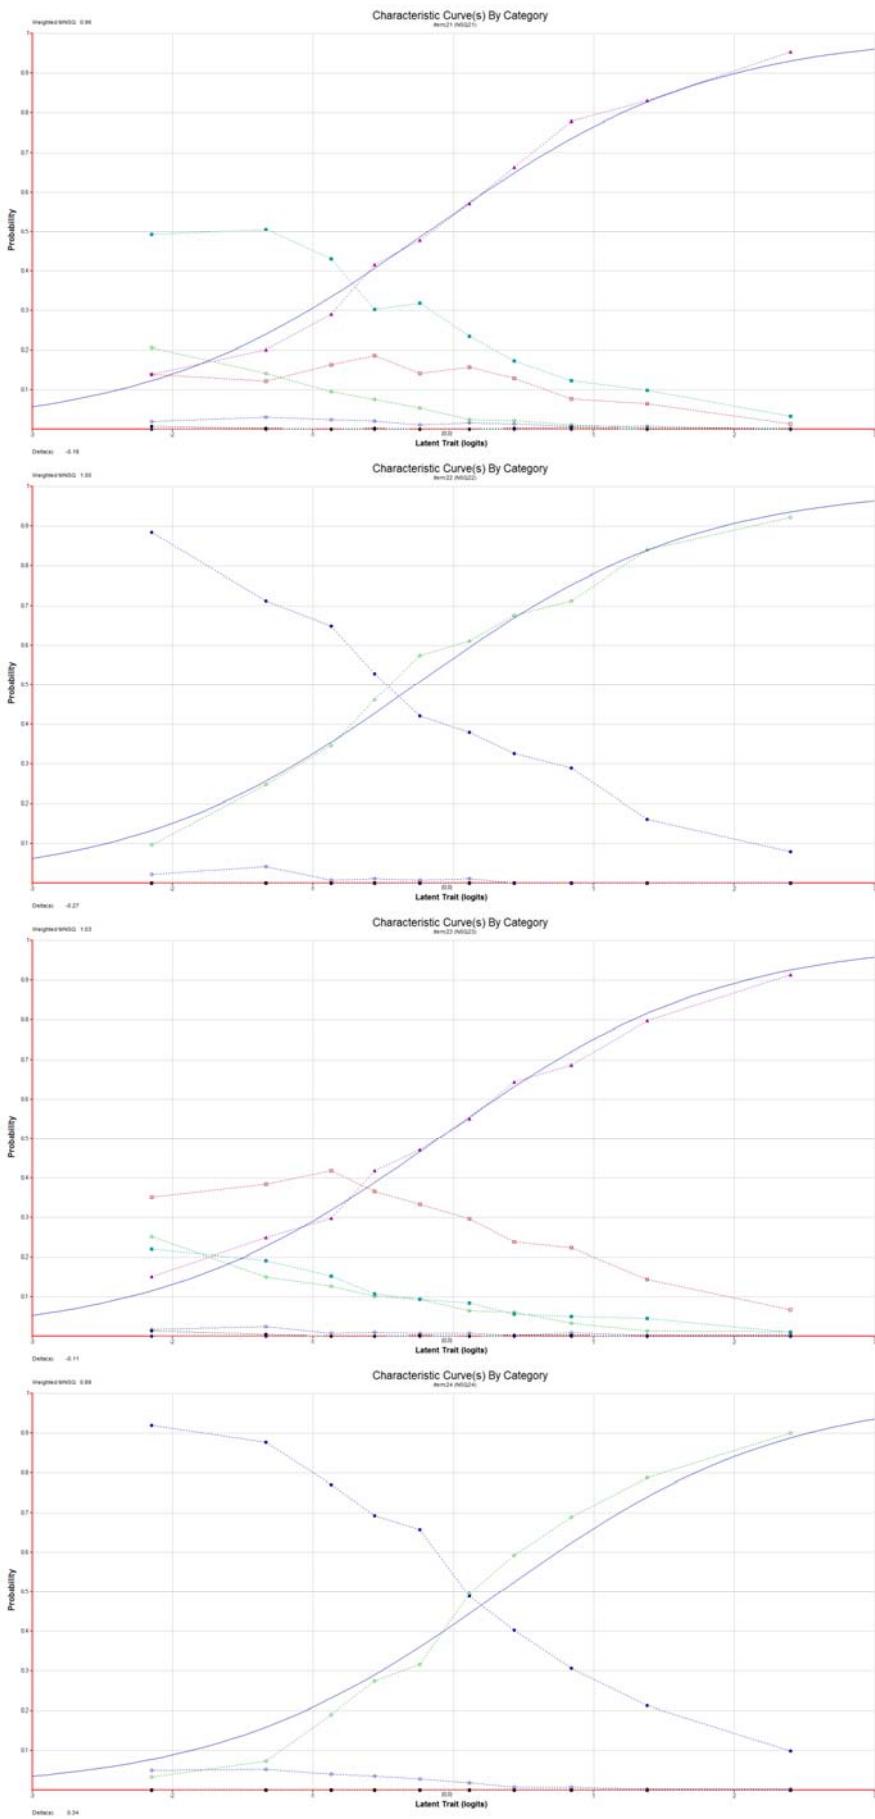

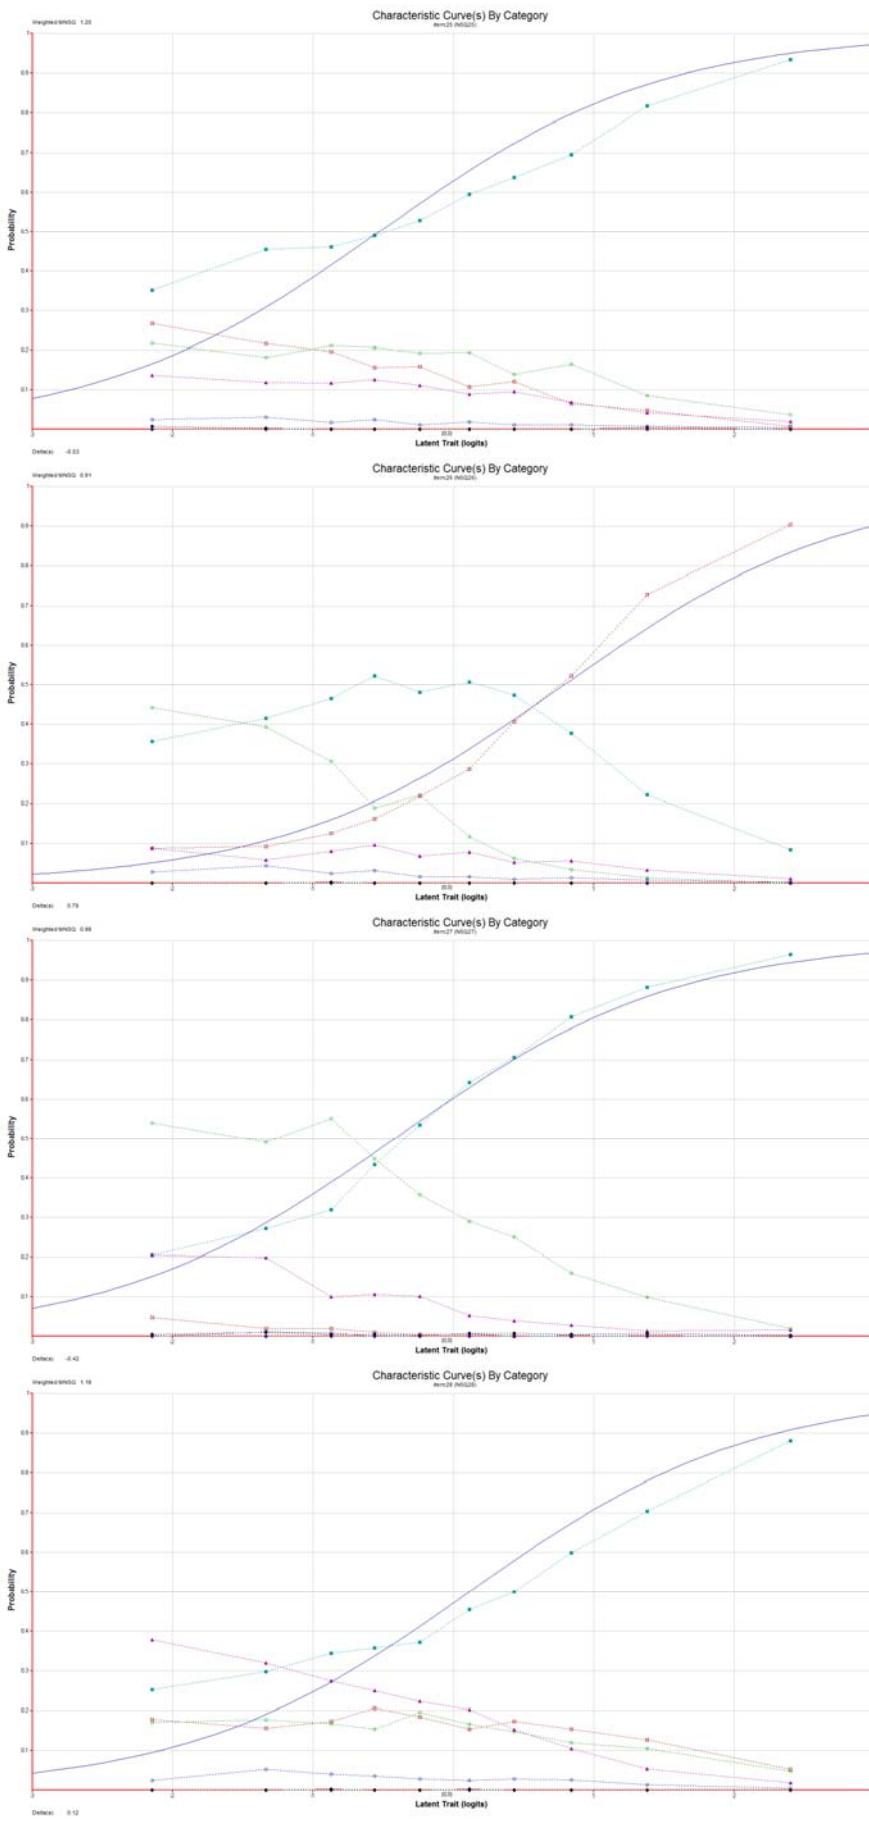

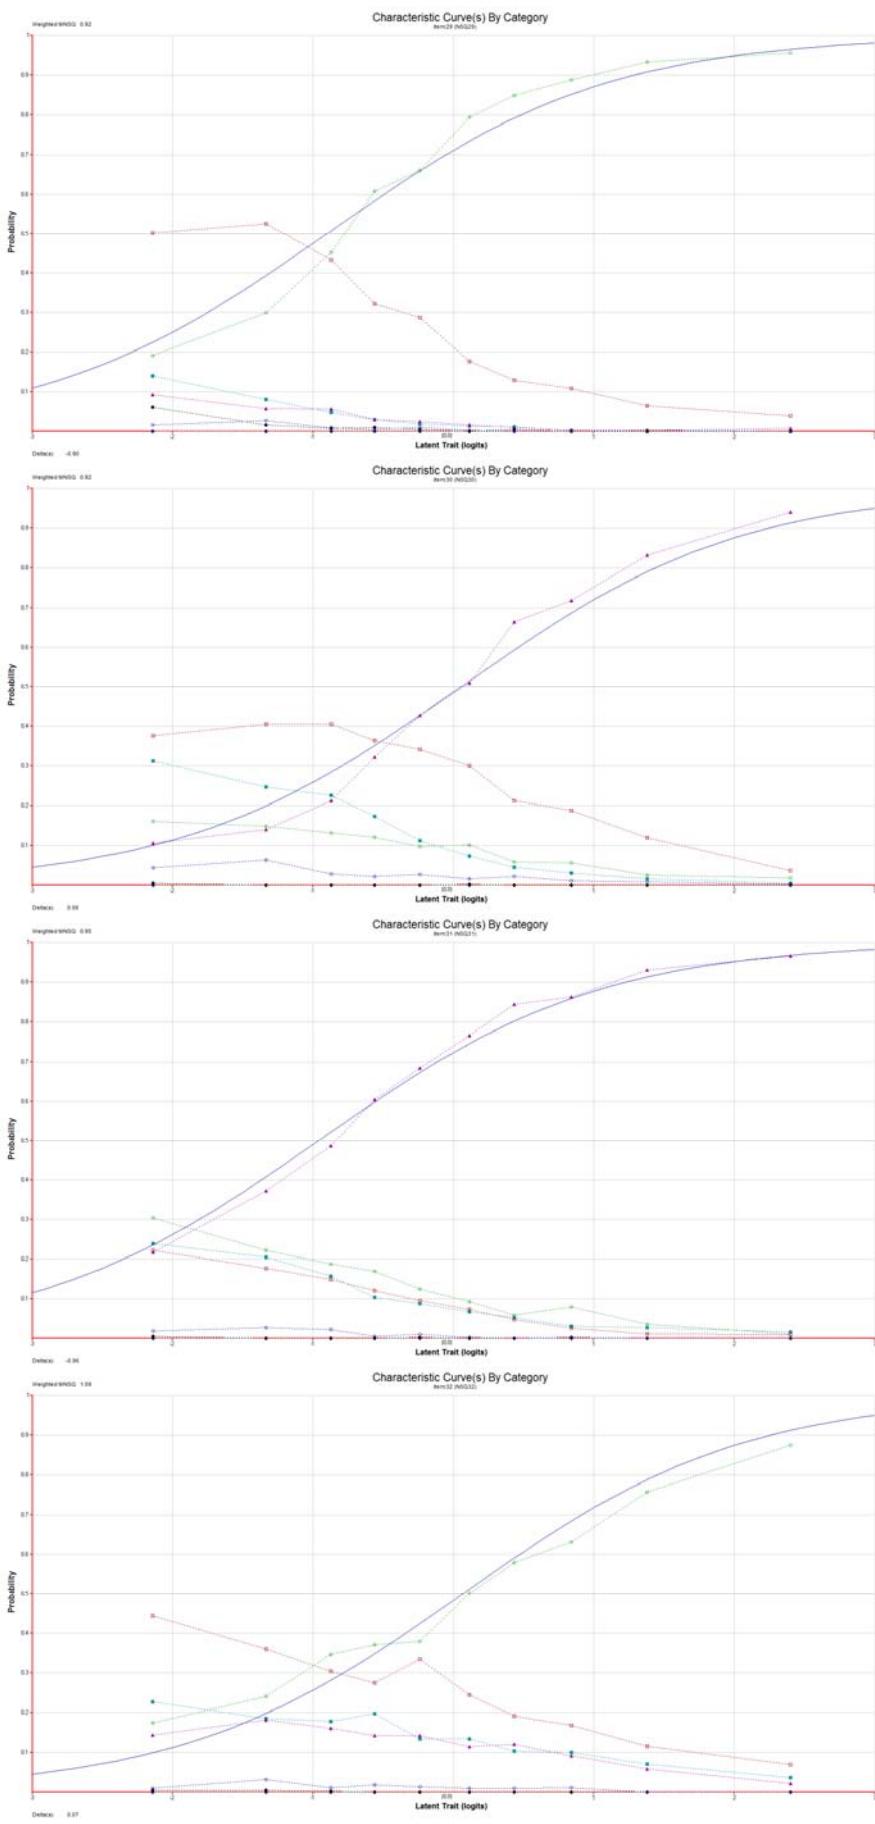

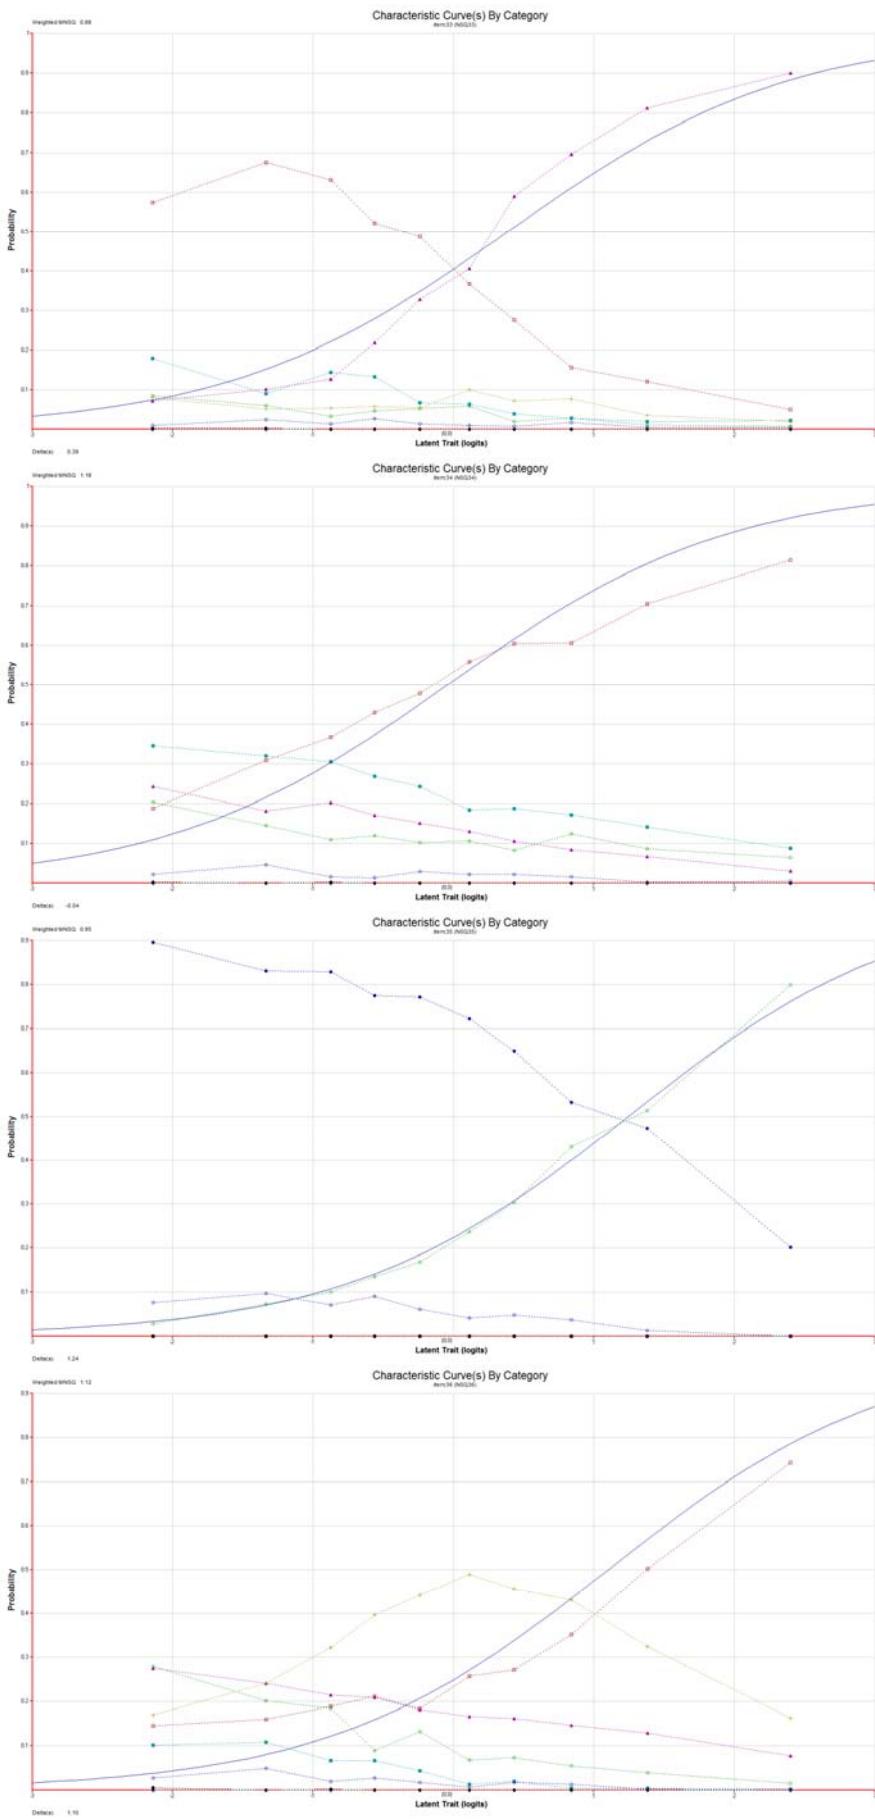

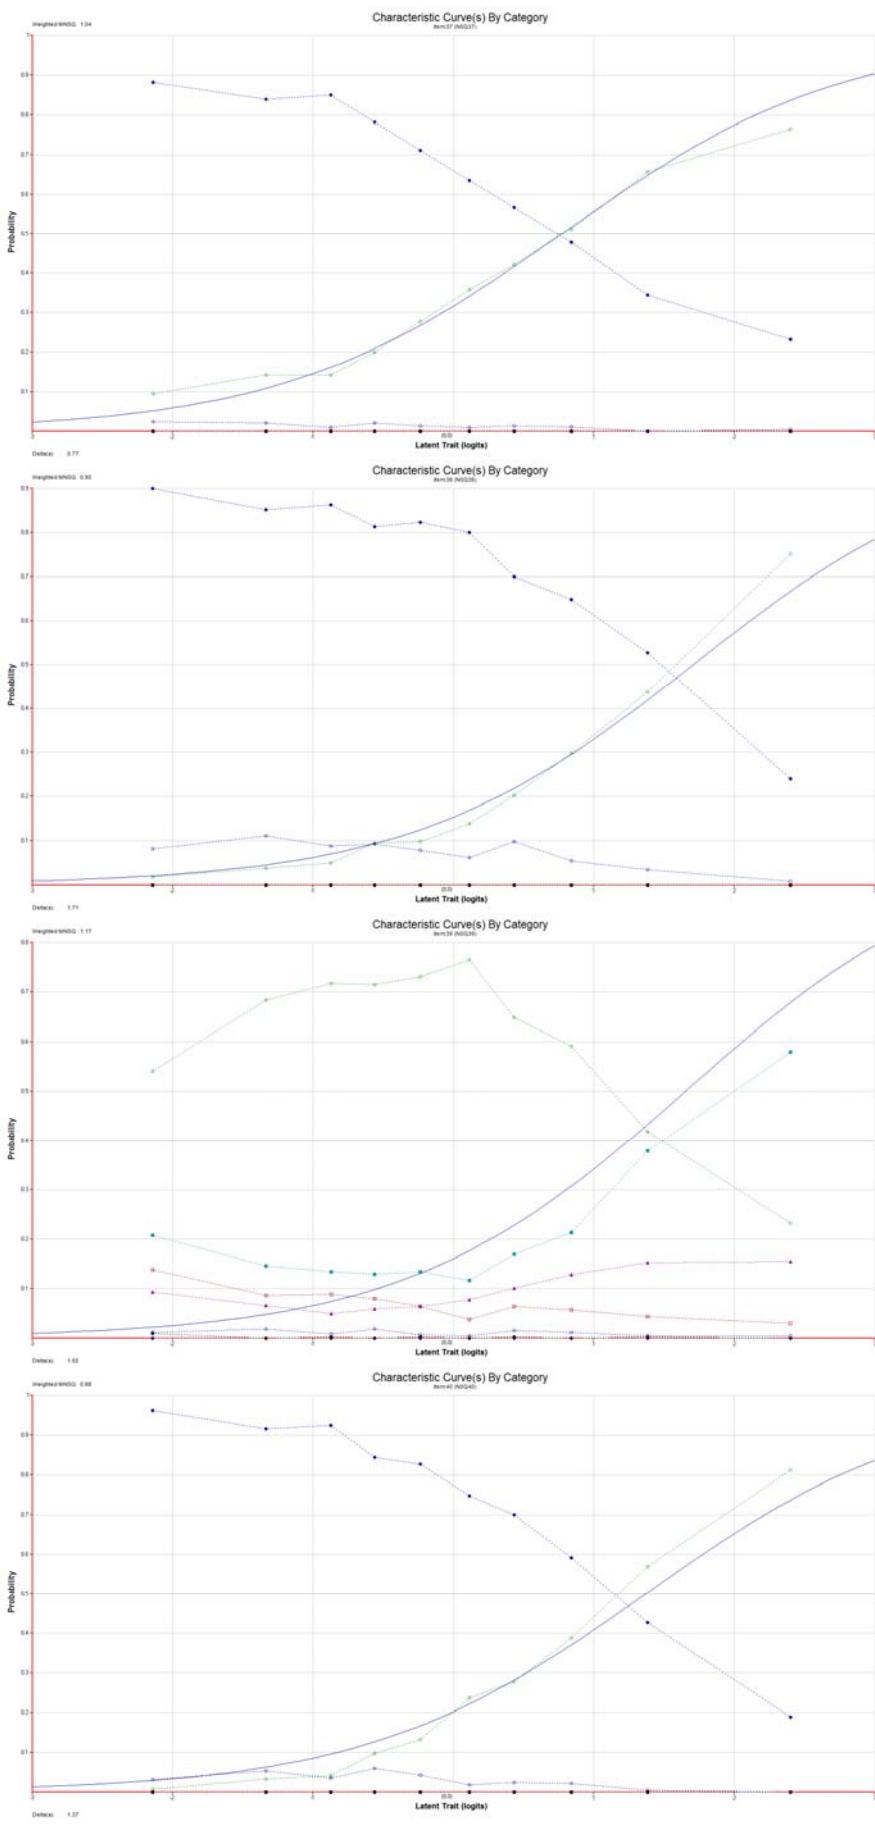

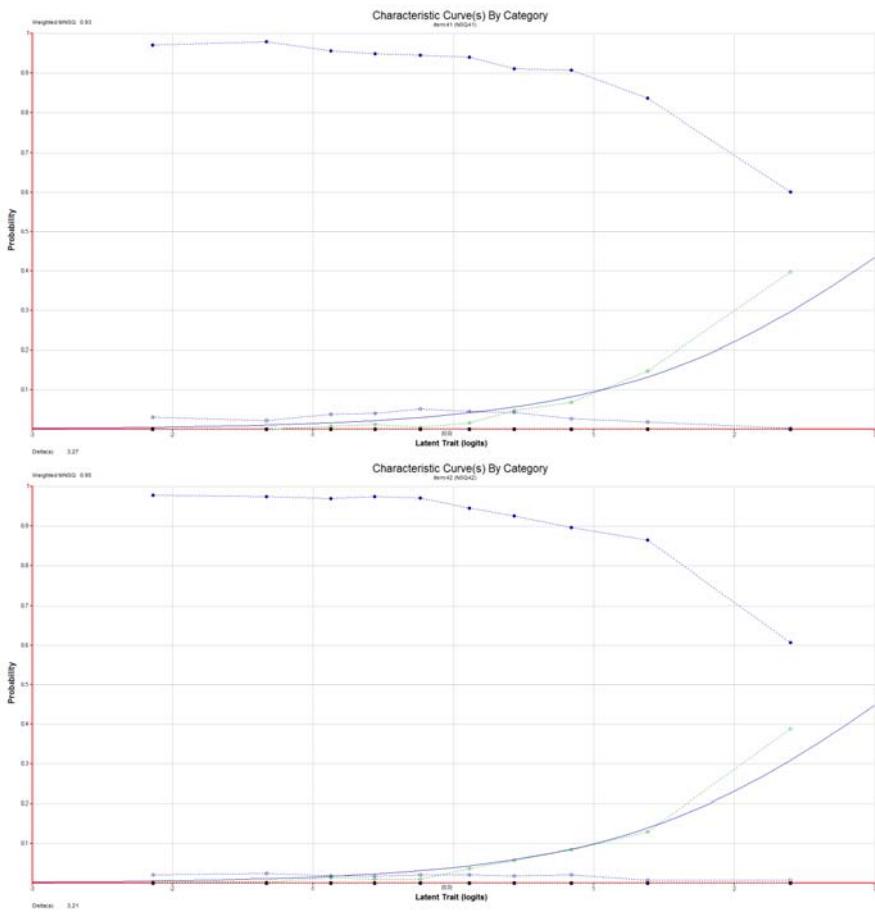

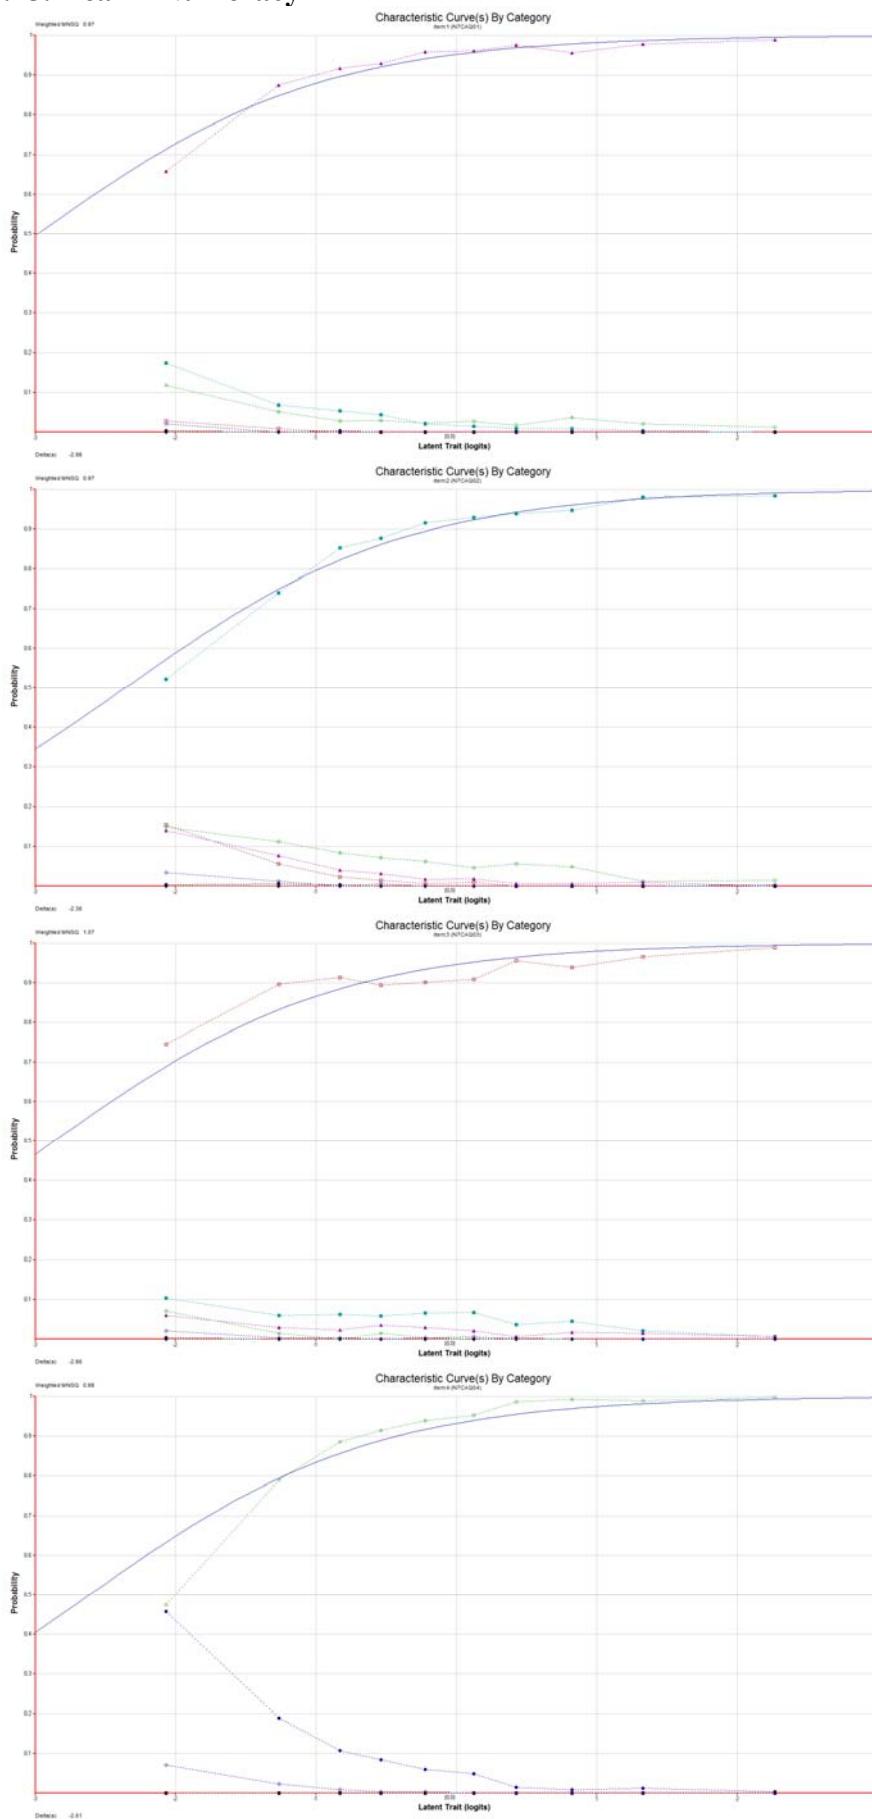

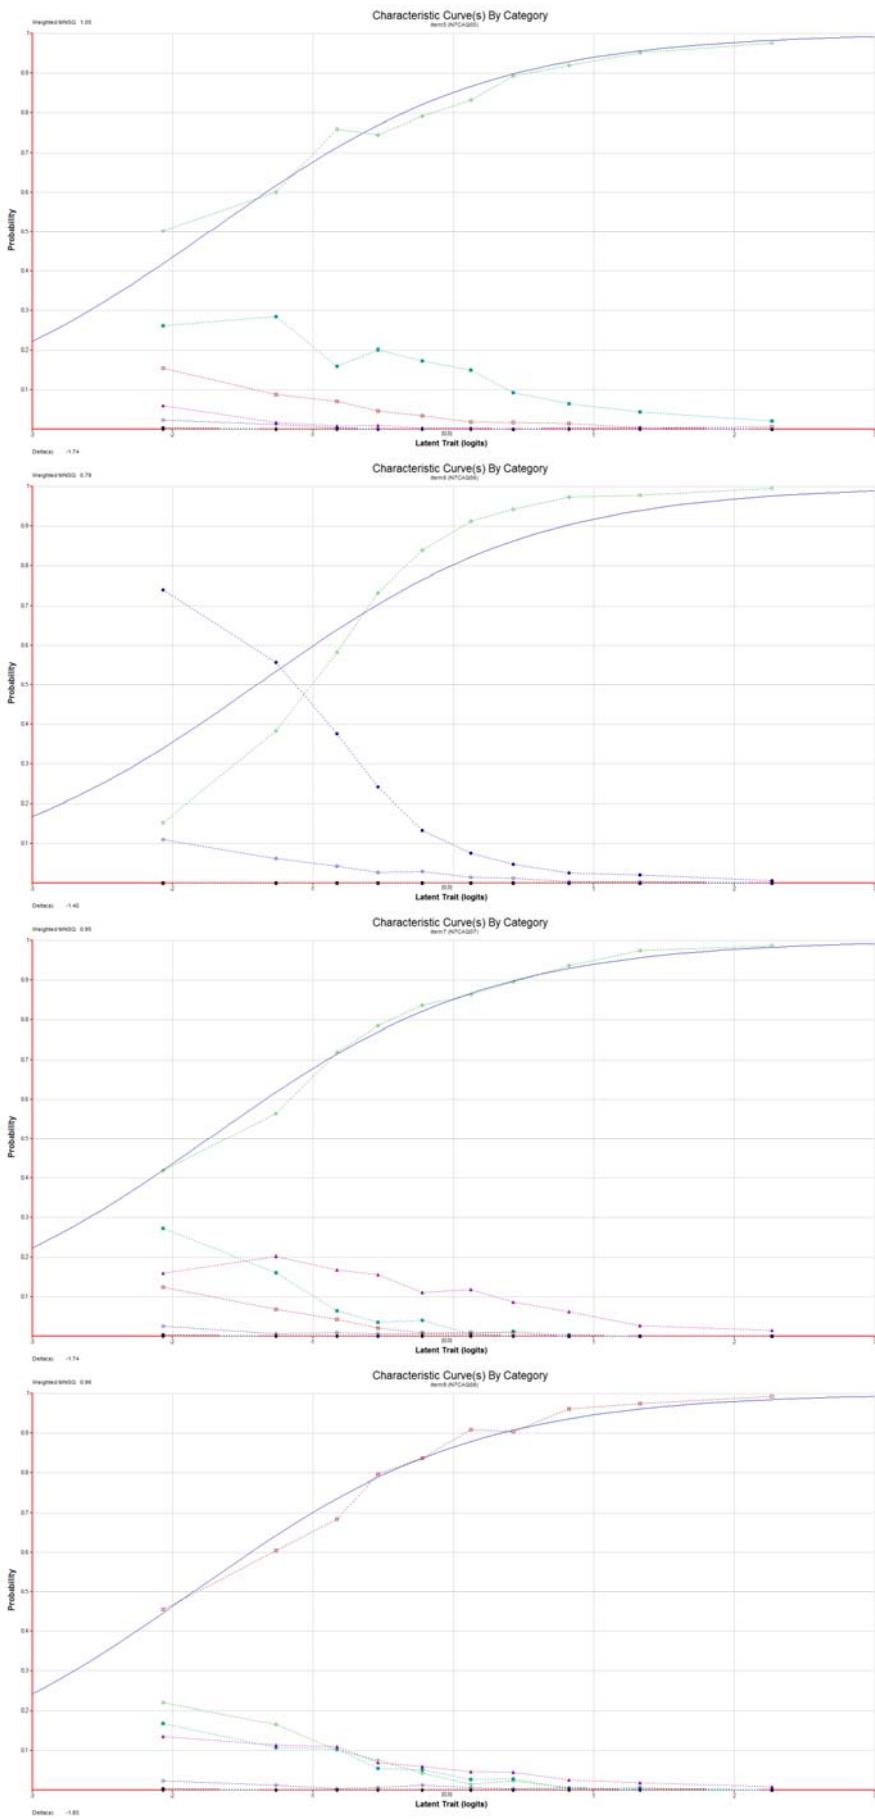

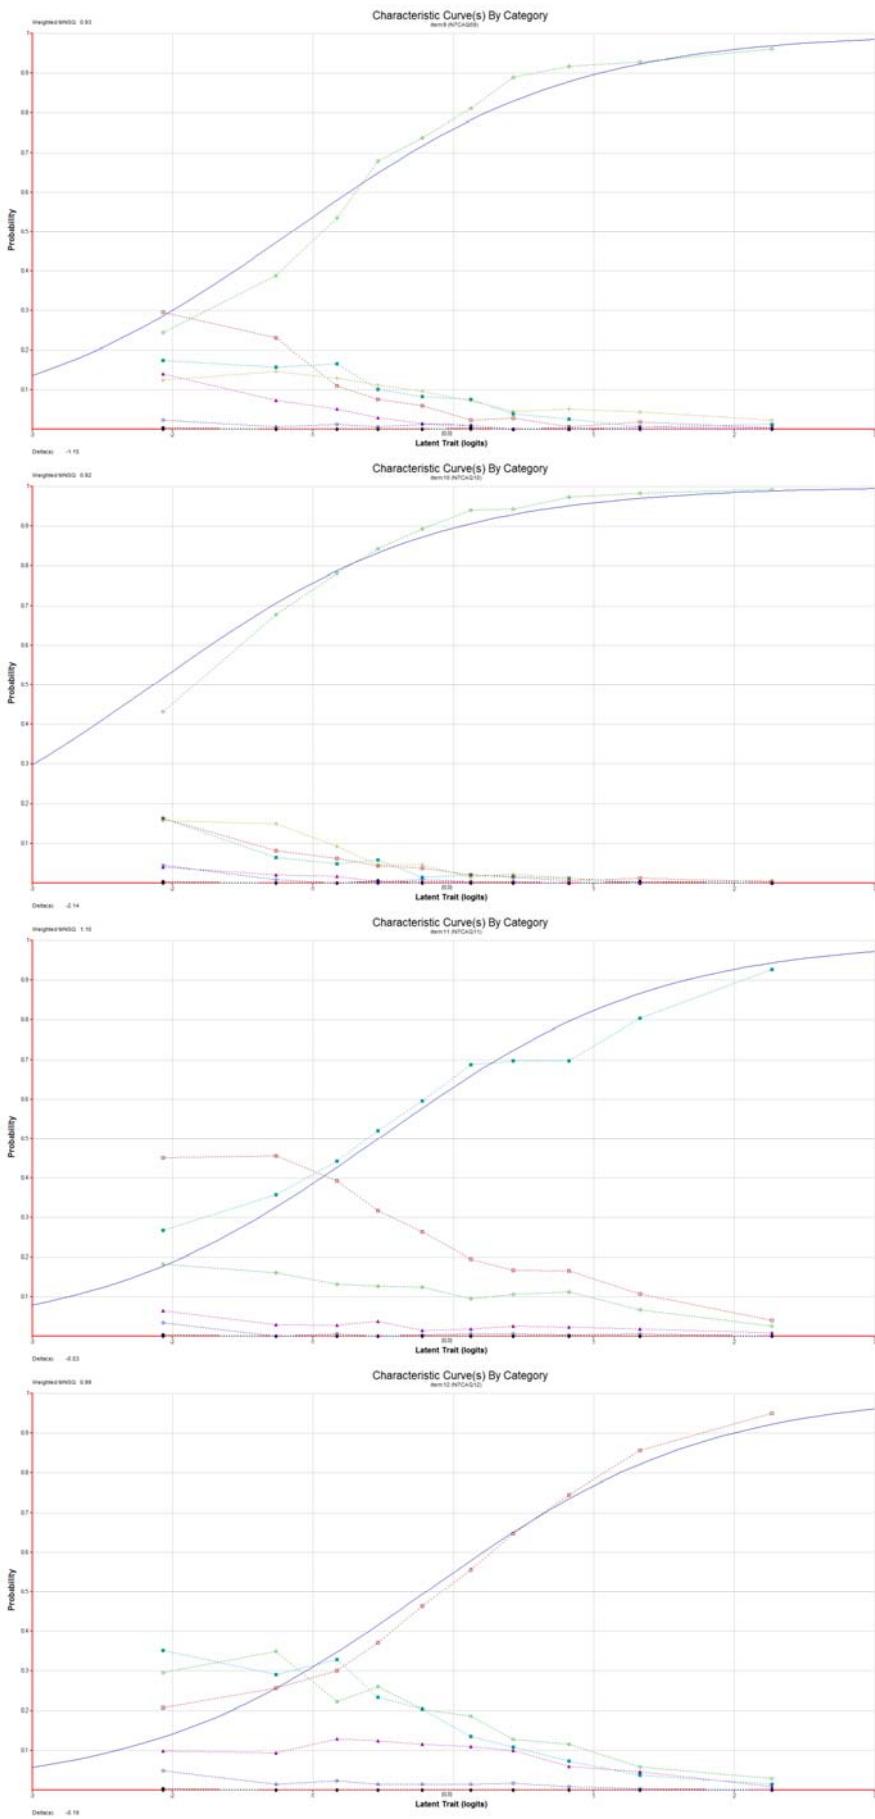

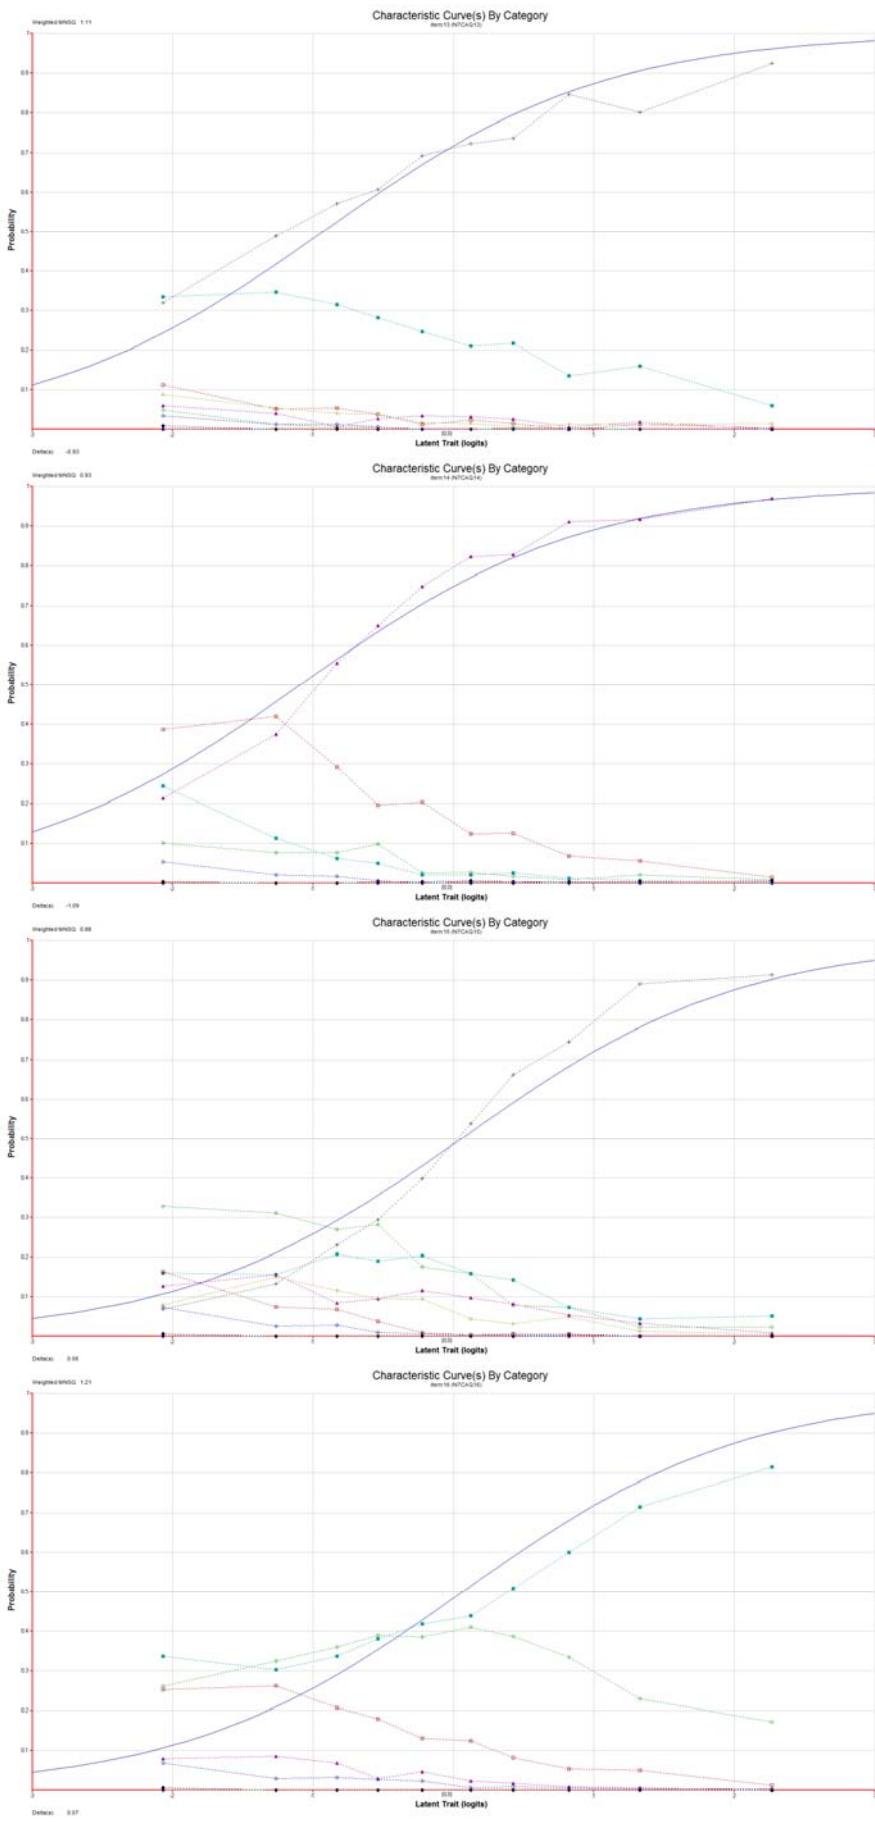

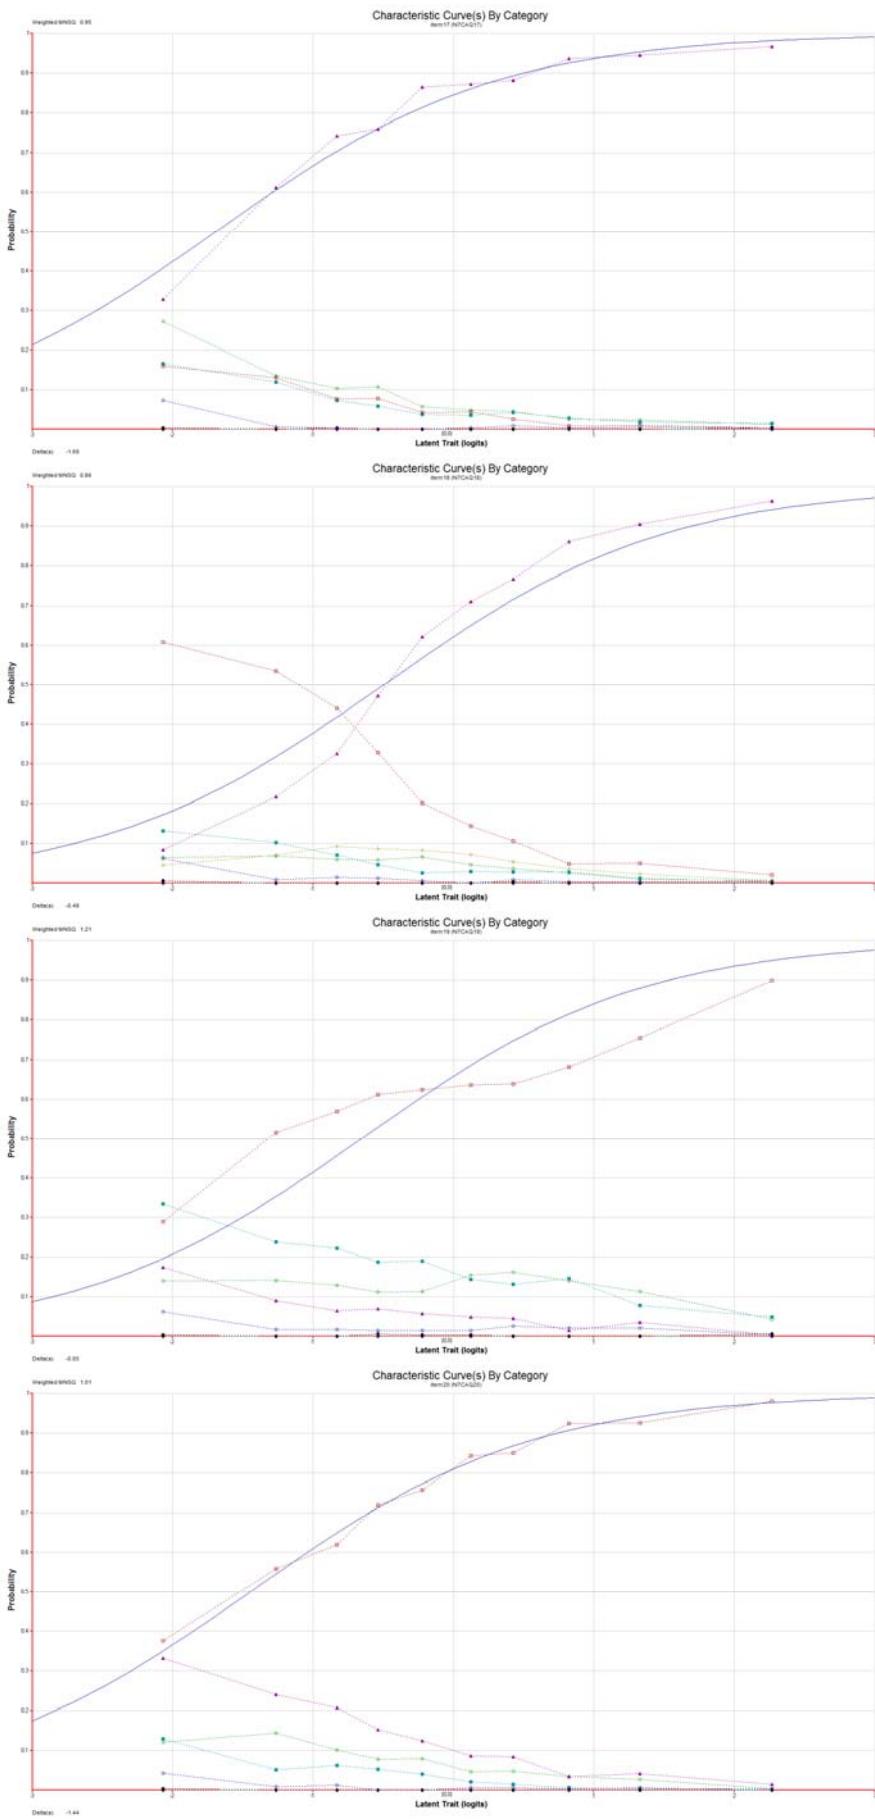

## D.15. Year 7 Numeracy

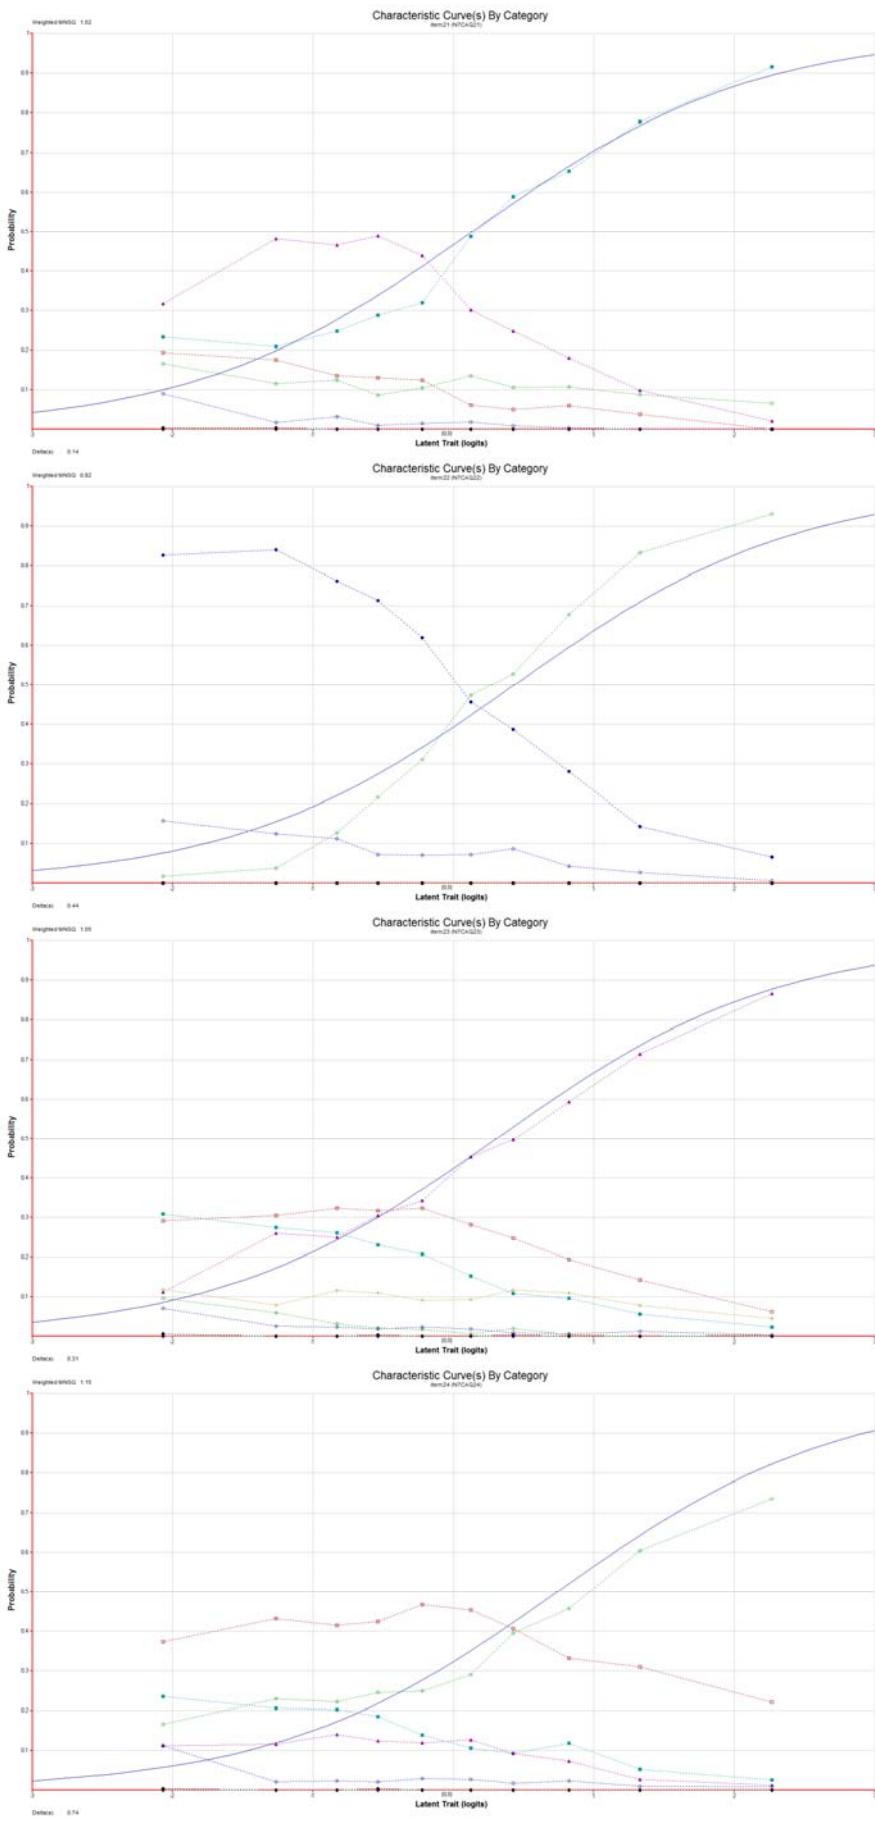

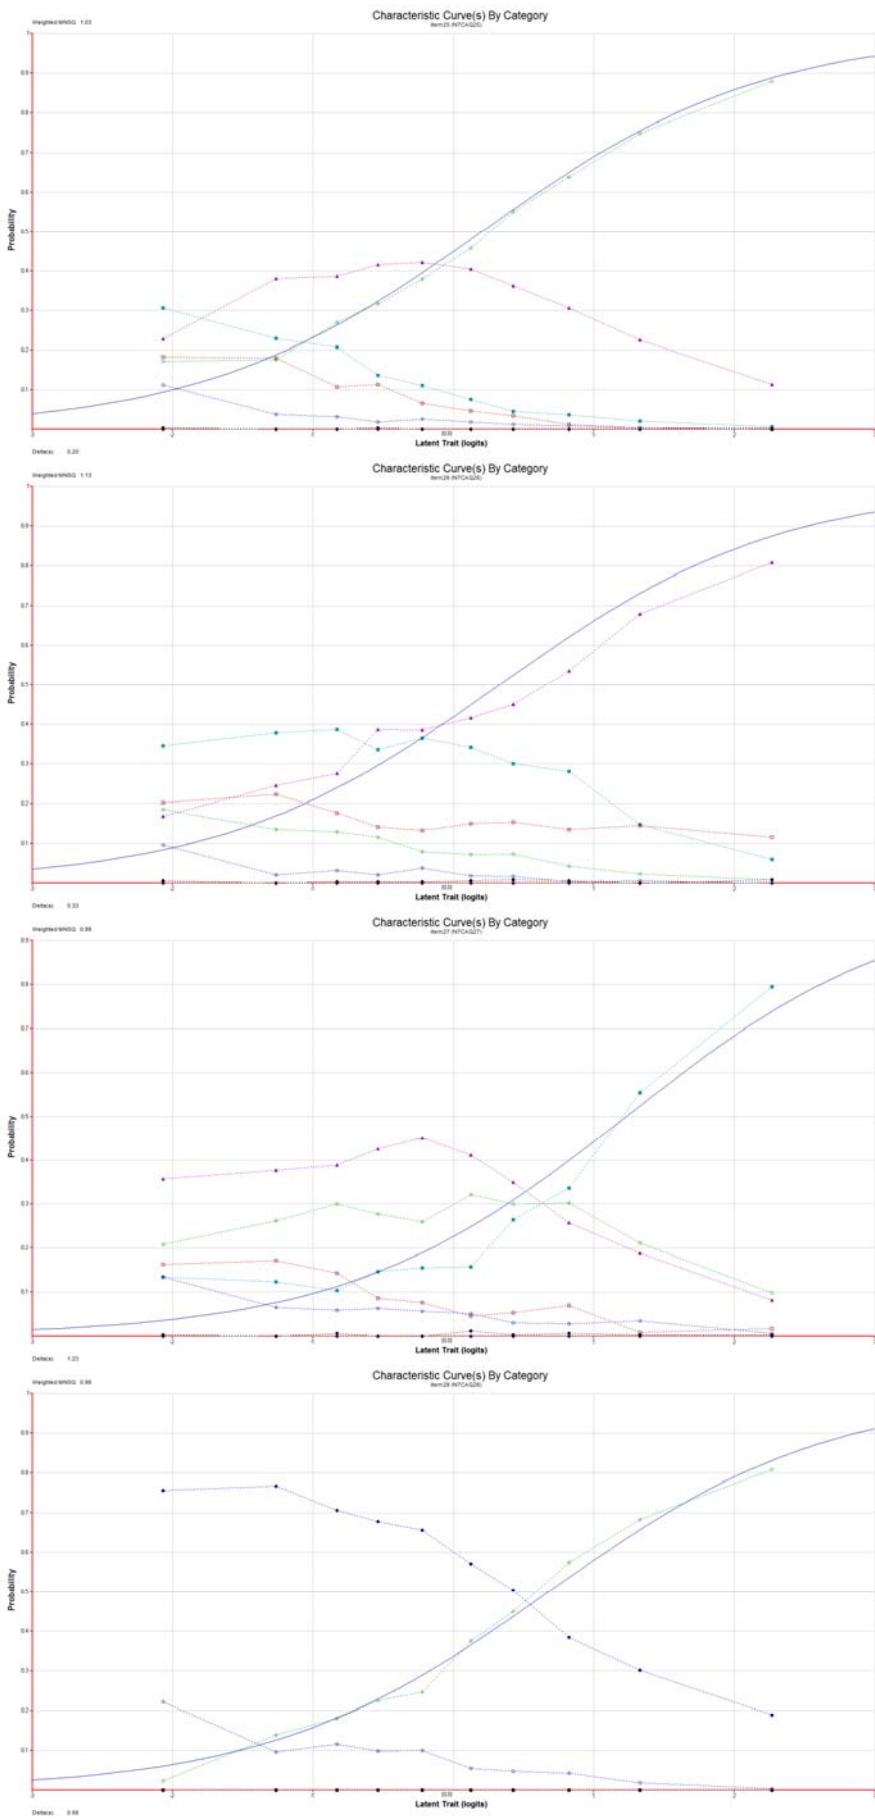

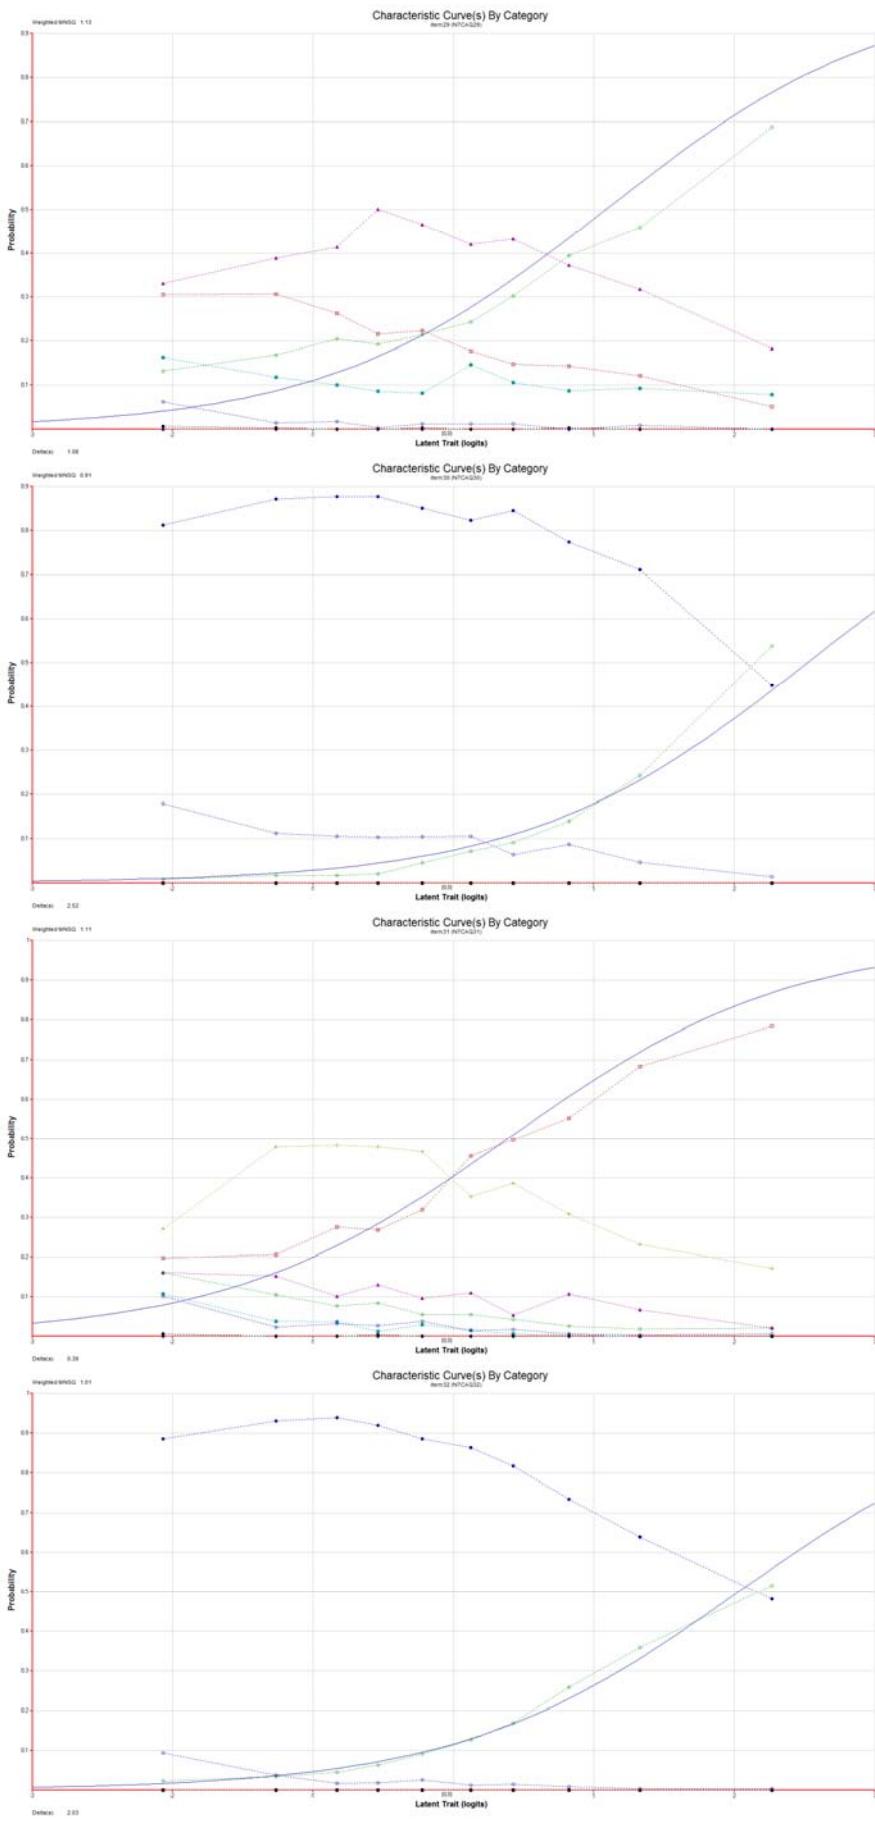

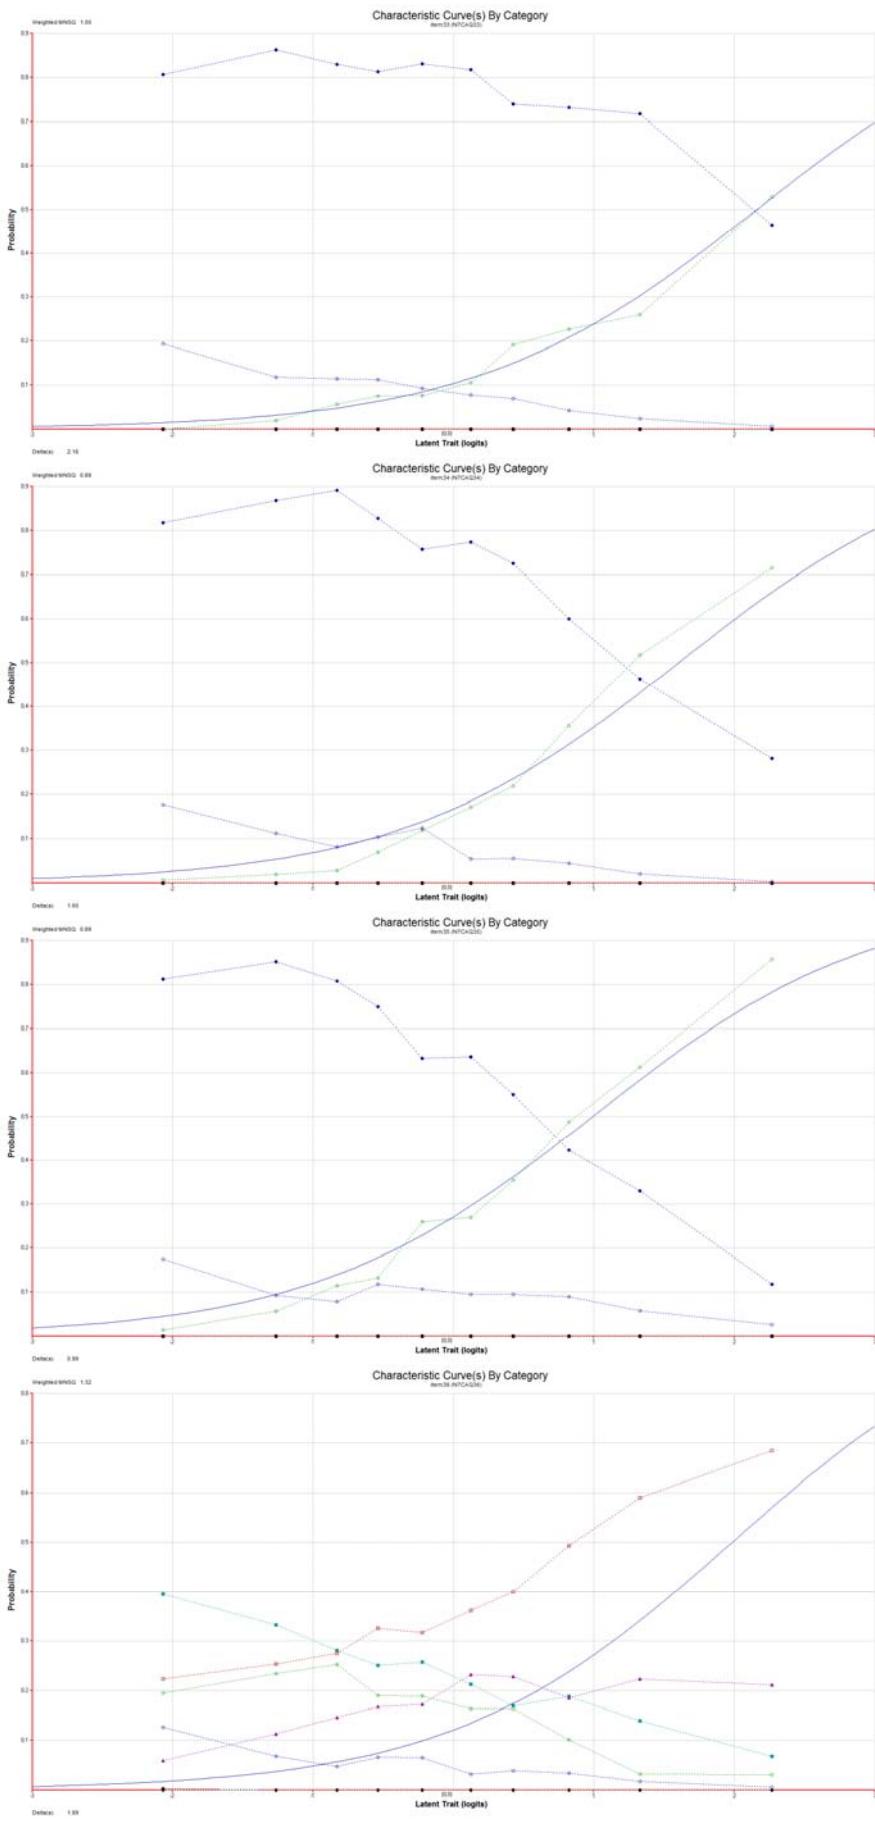

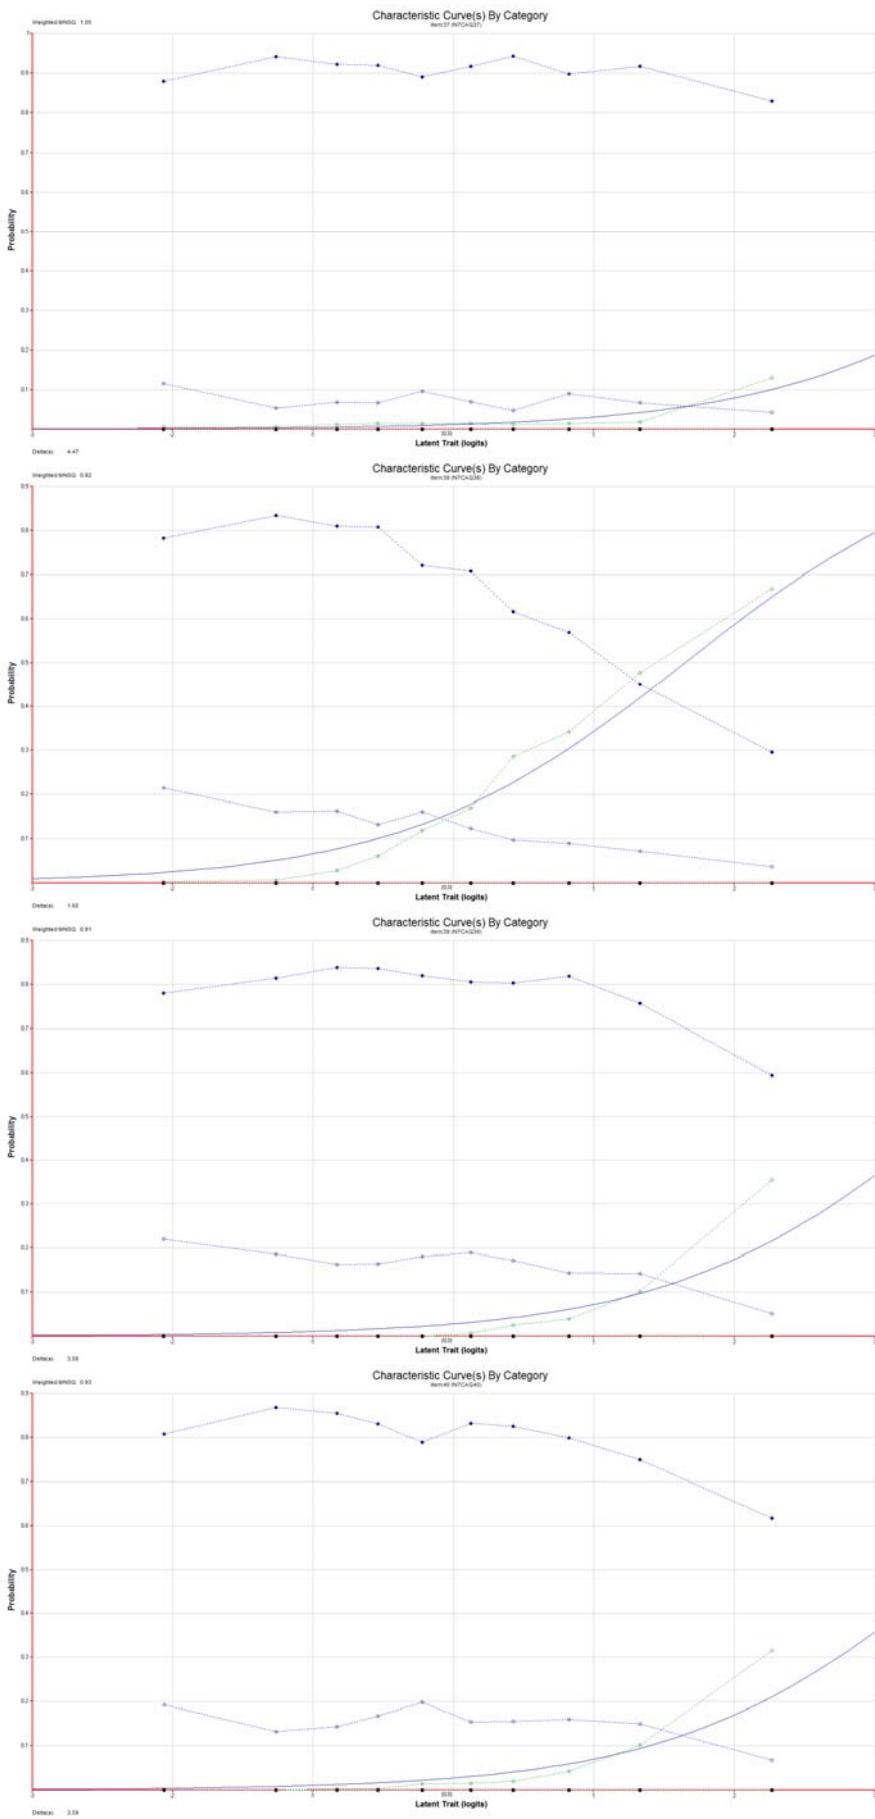

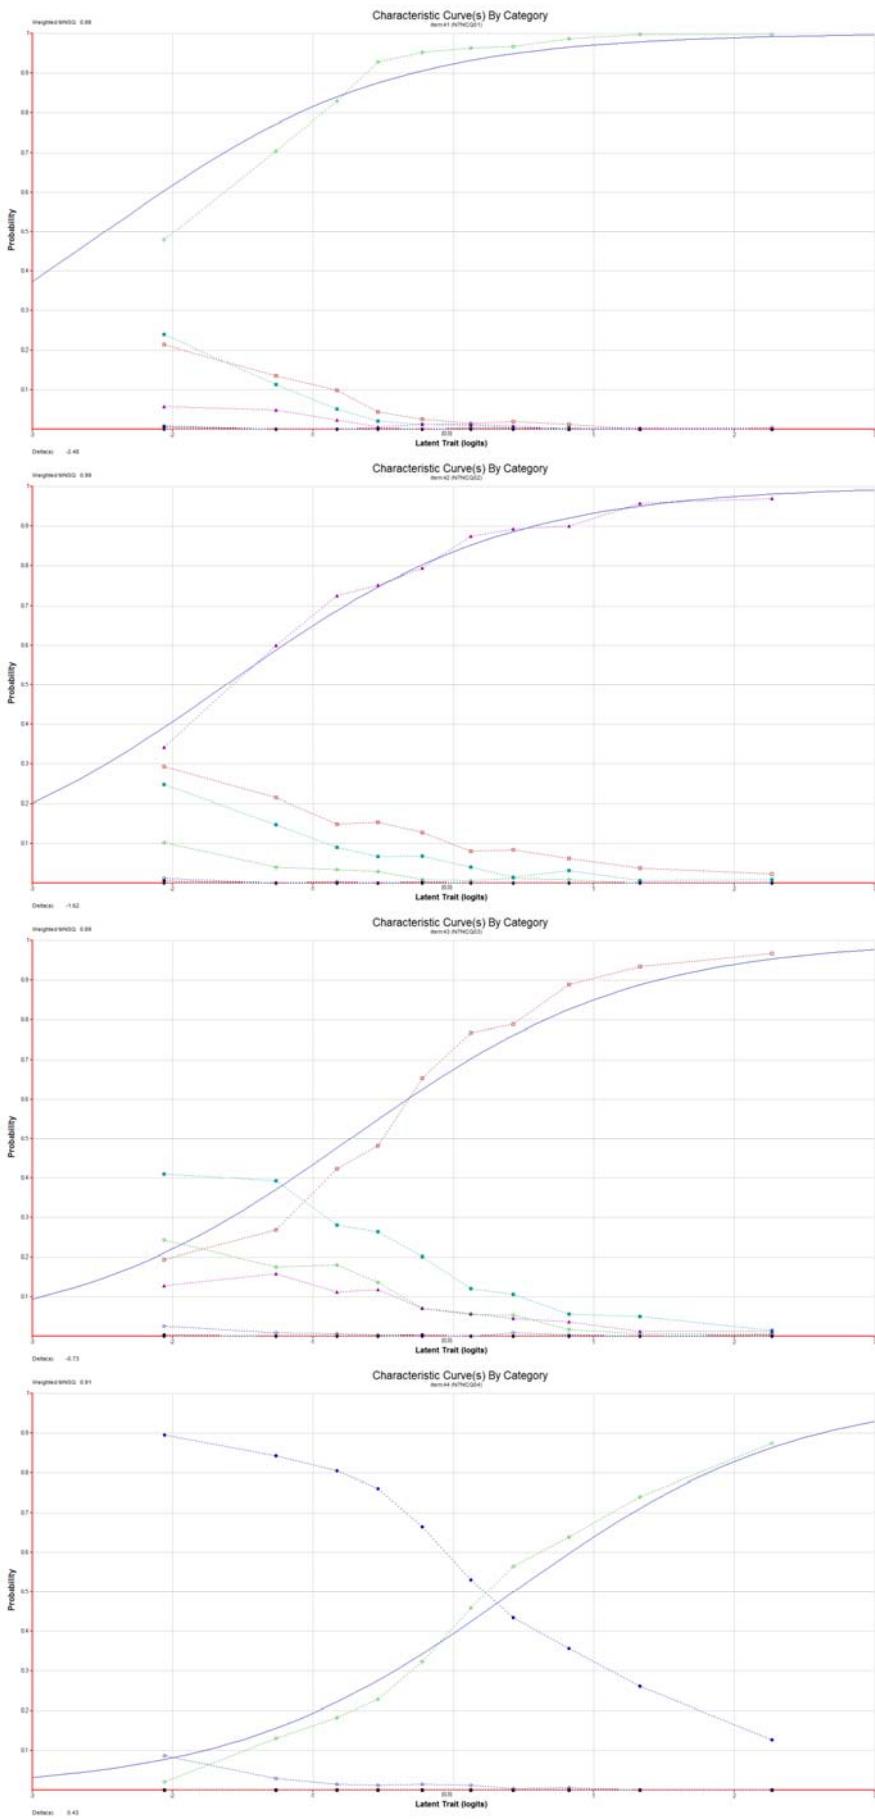

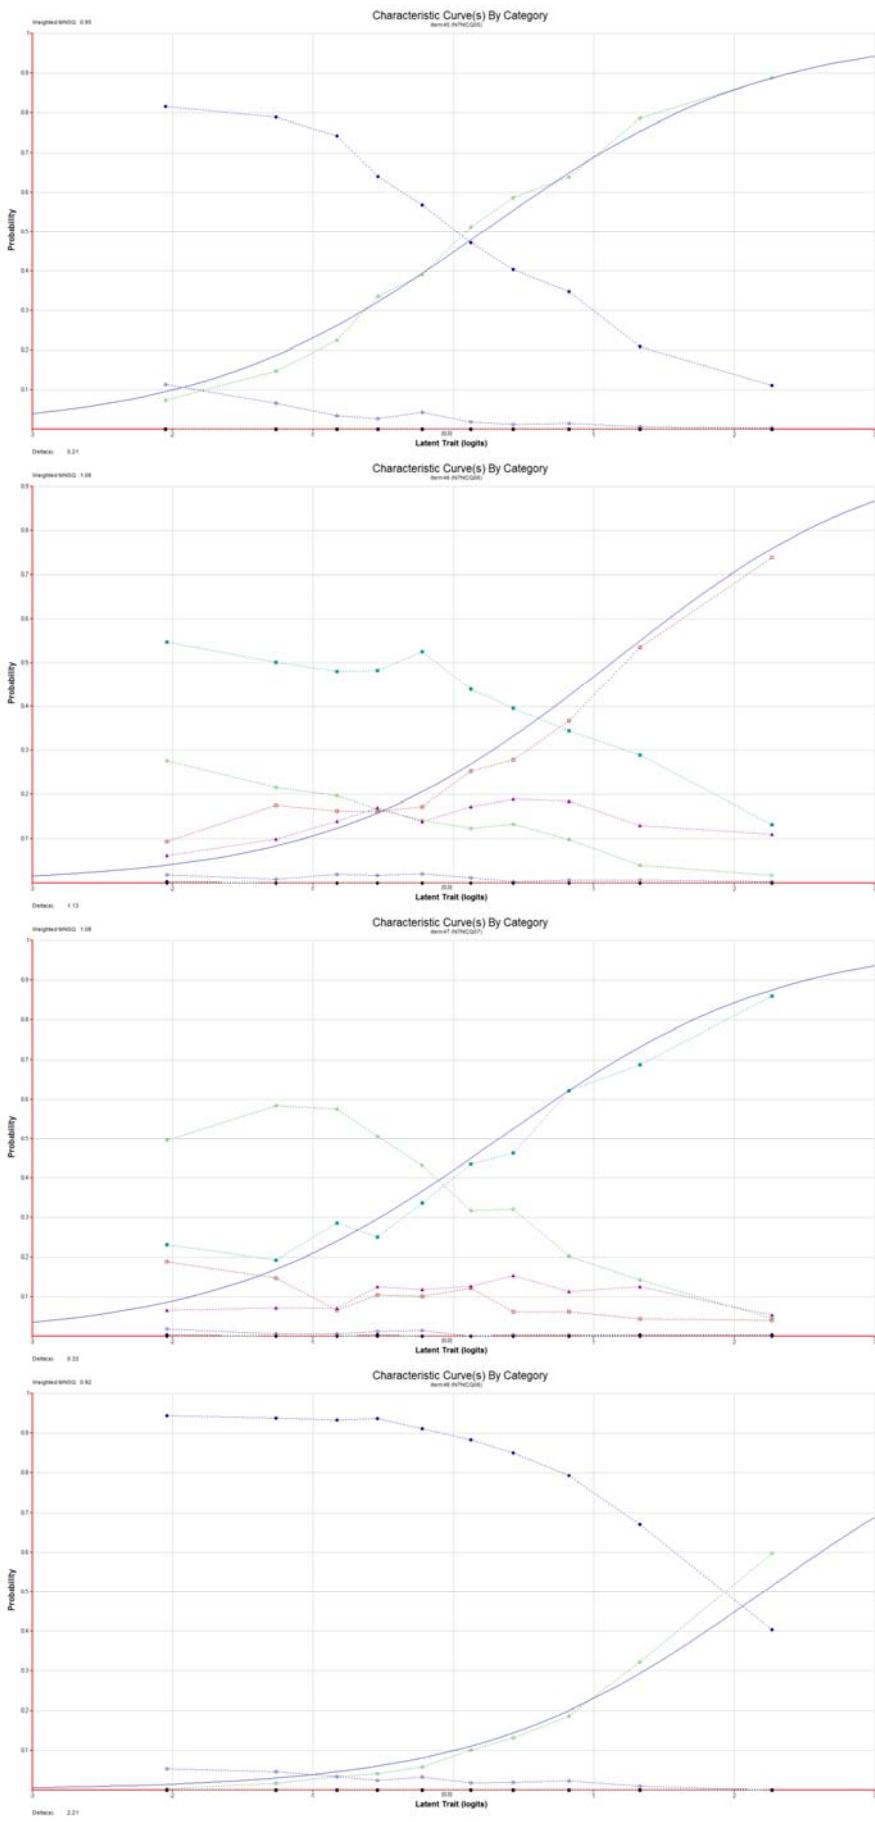

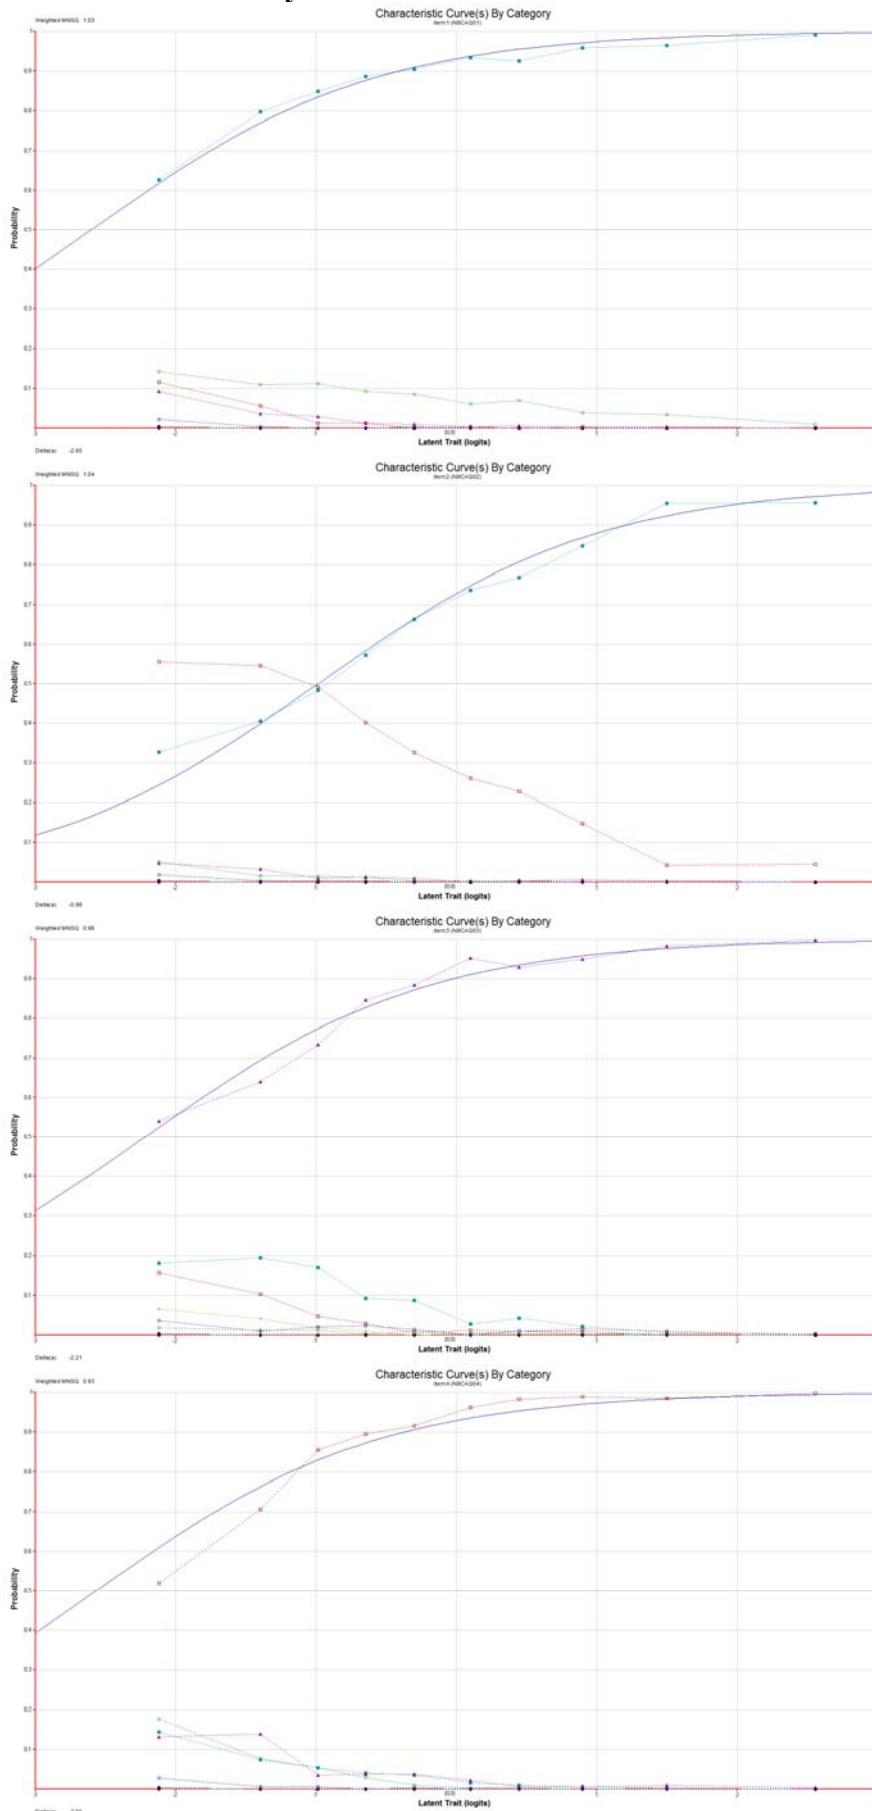

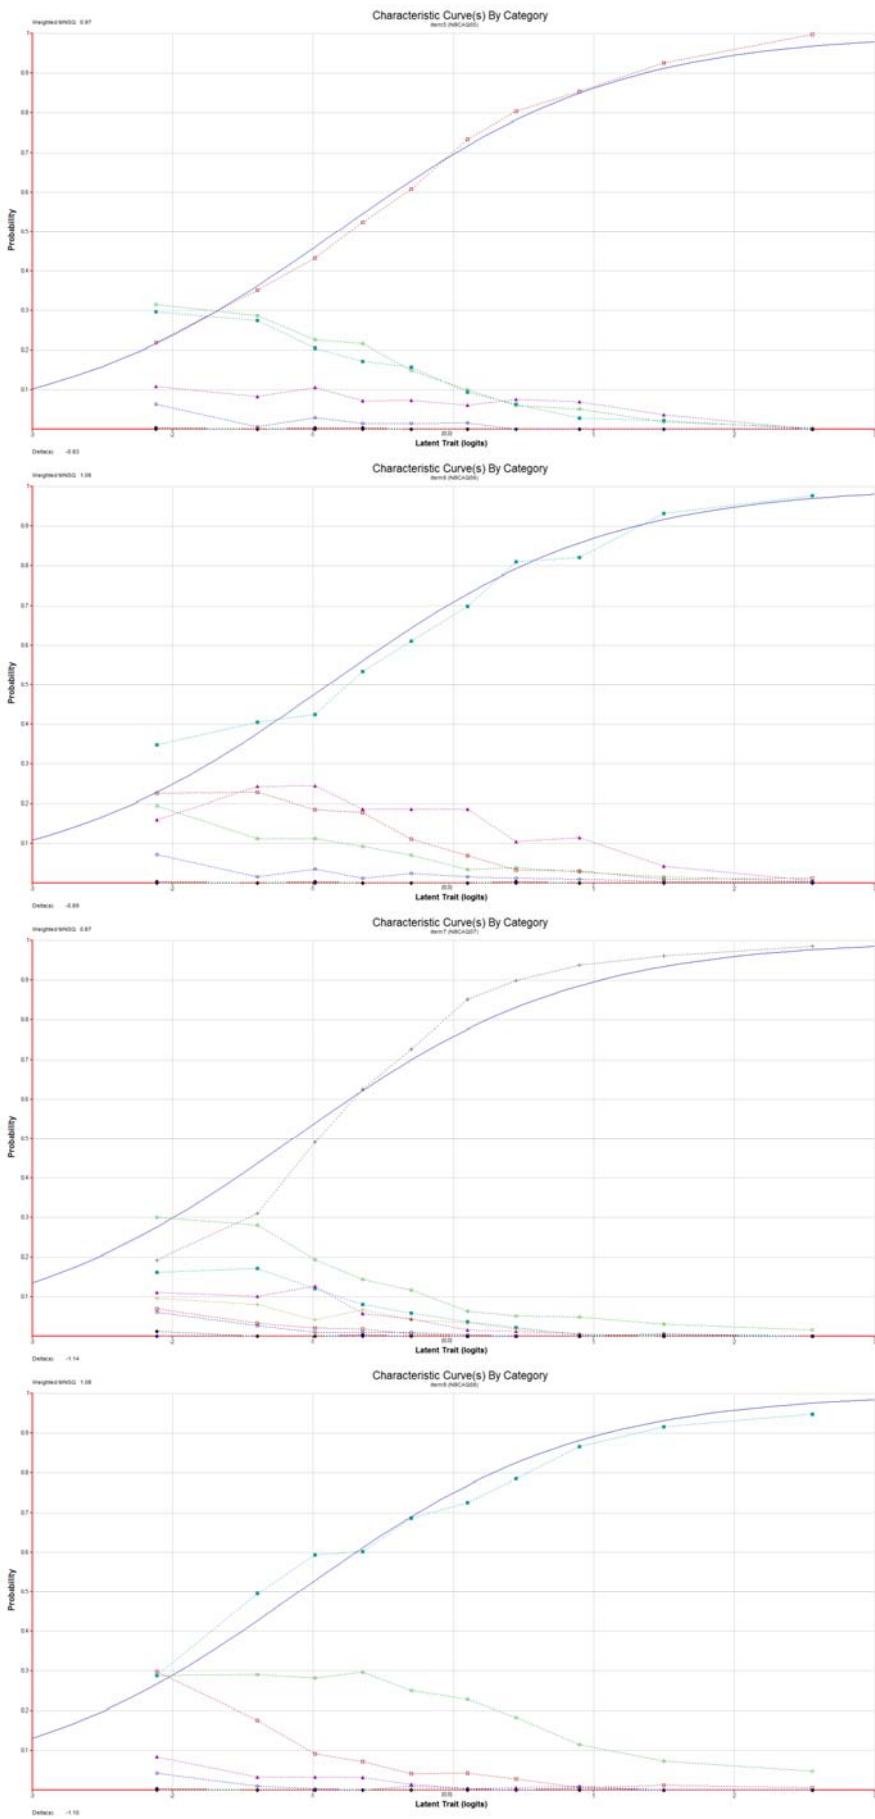

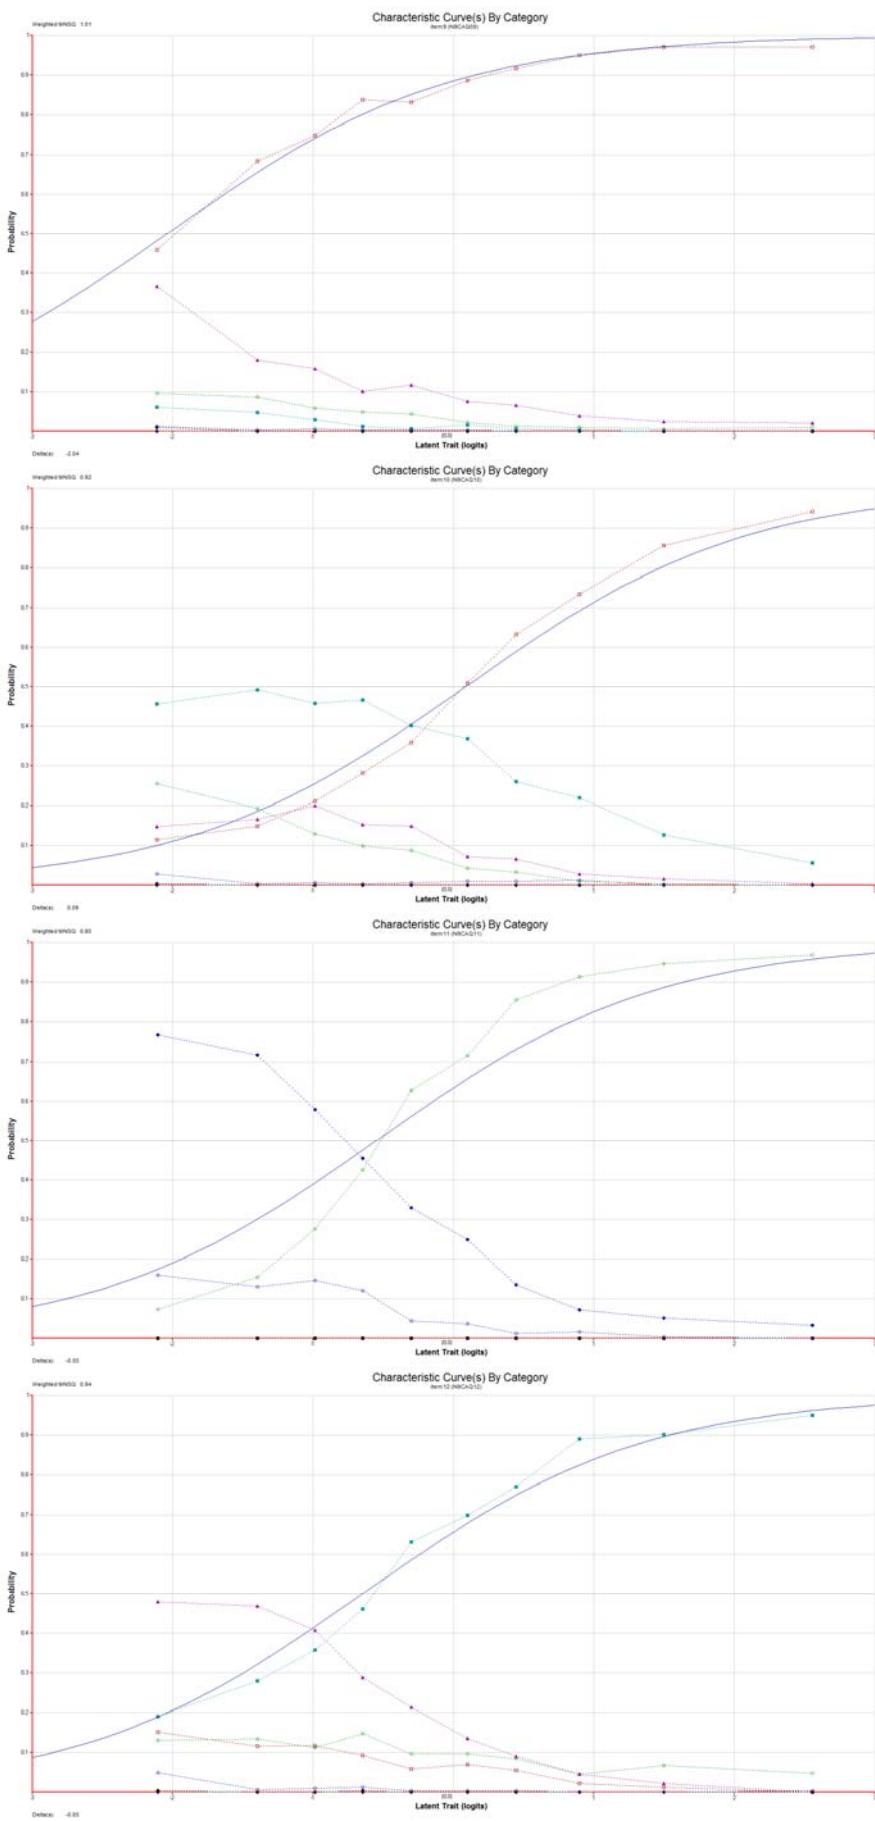

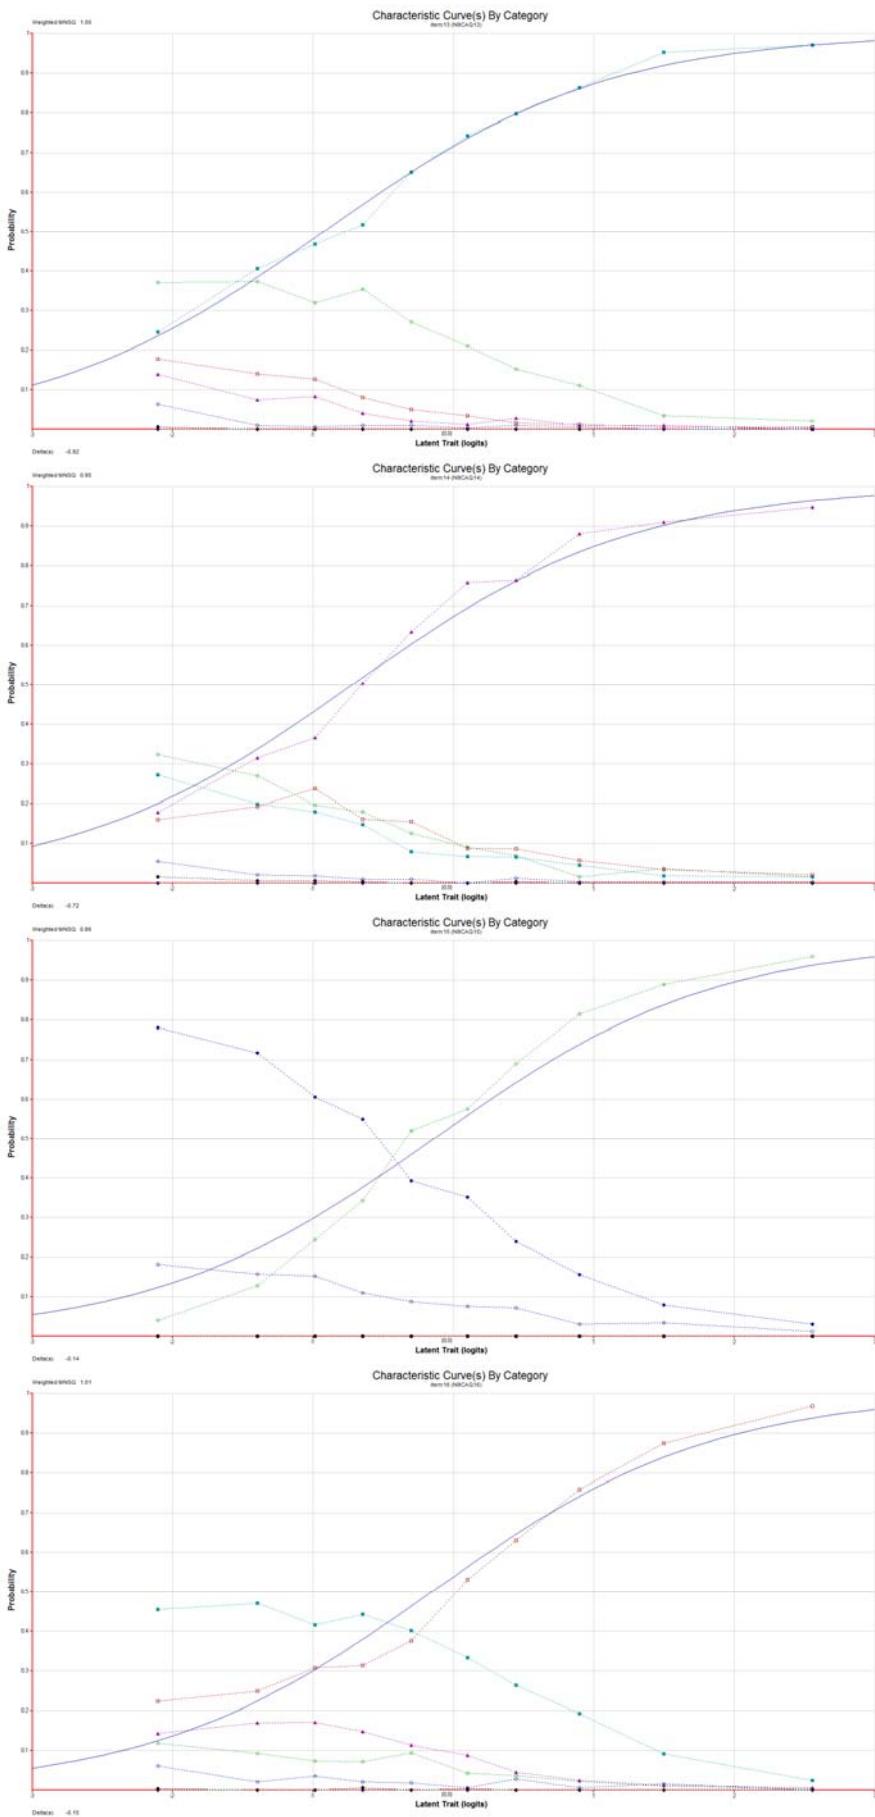

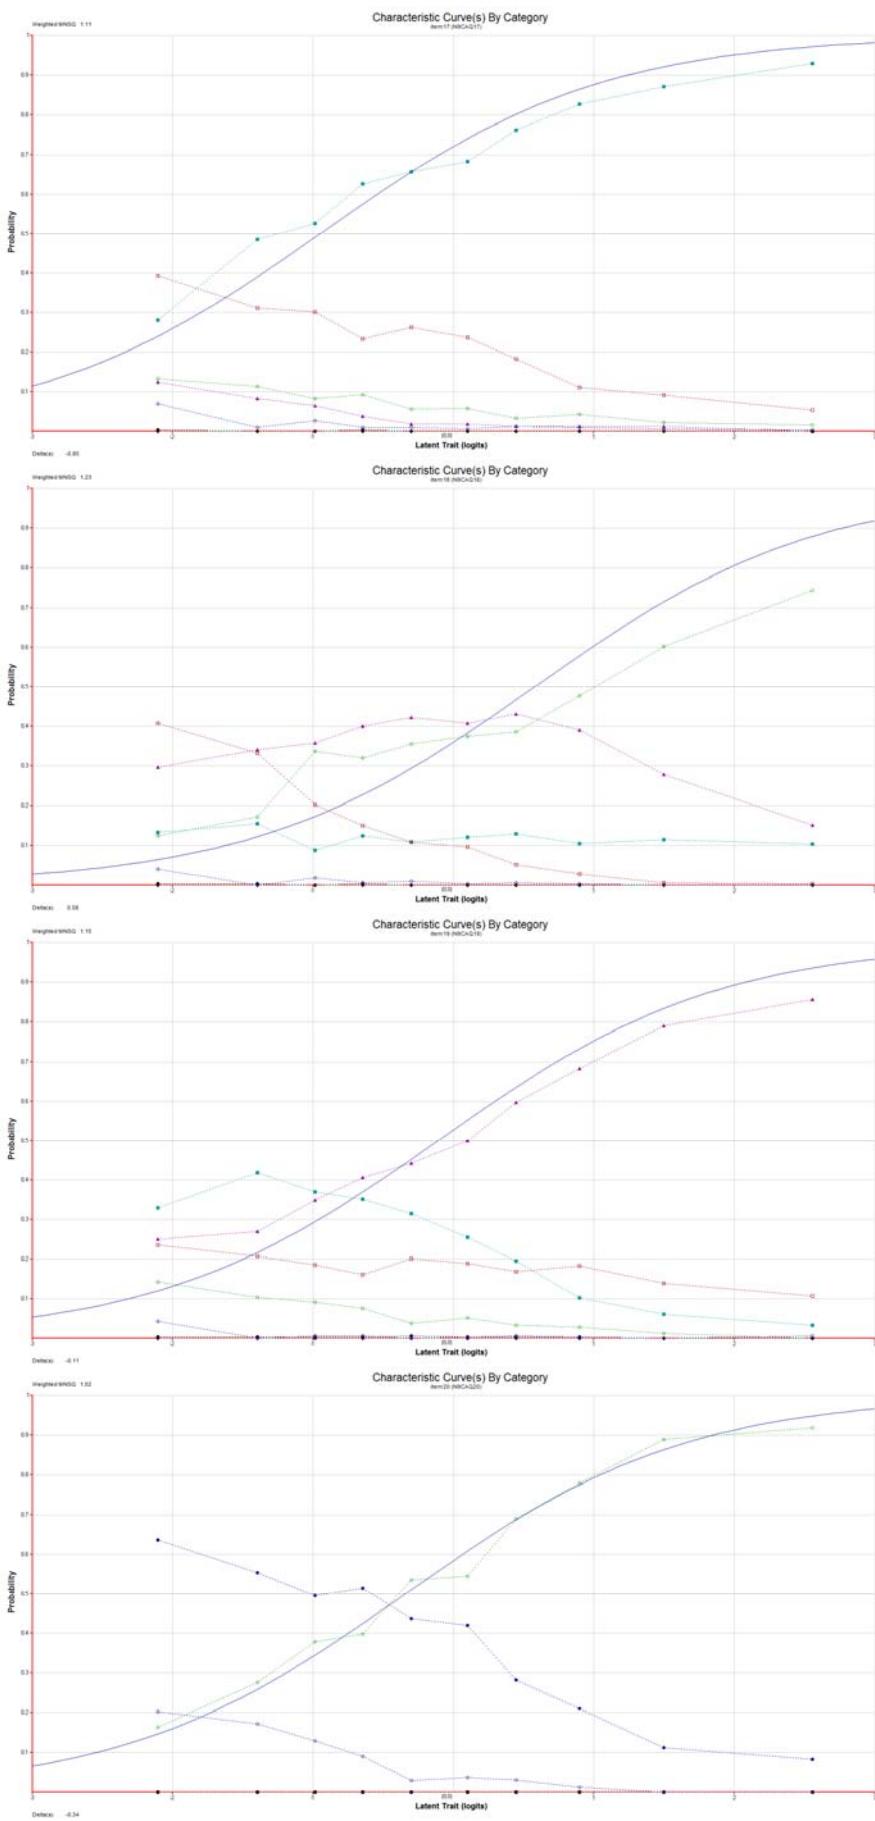

## D.16. Year 9 Numeracy

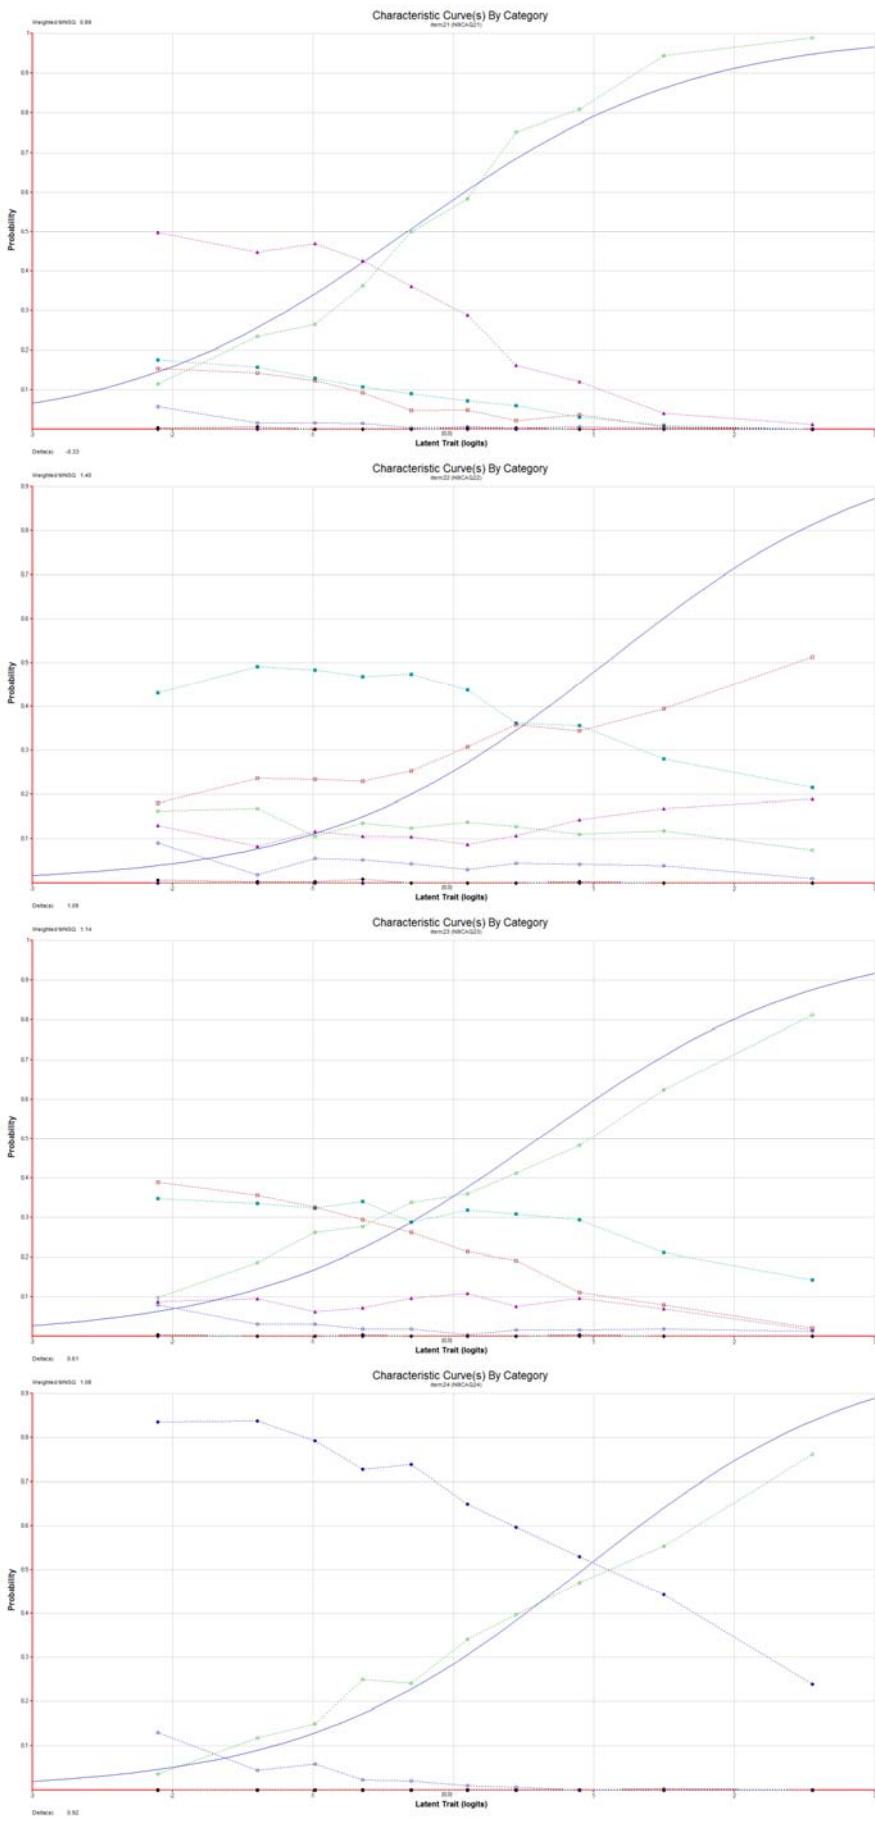

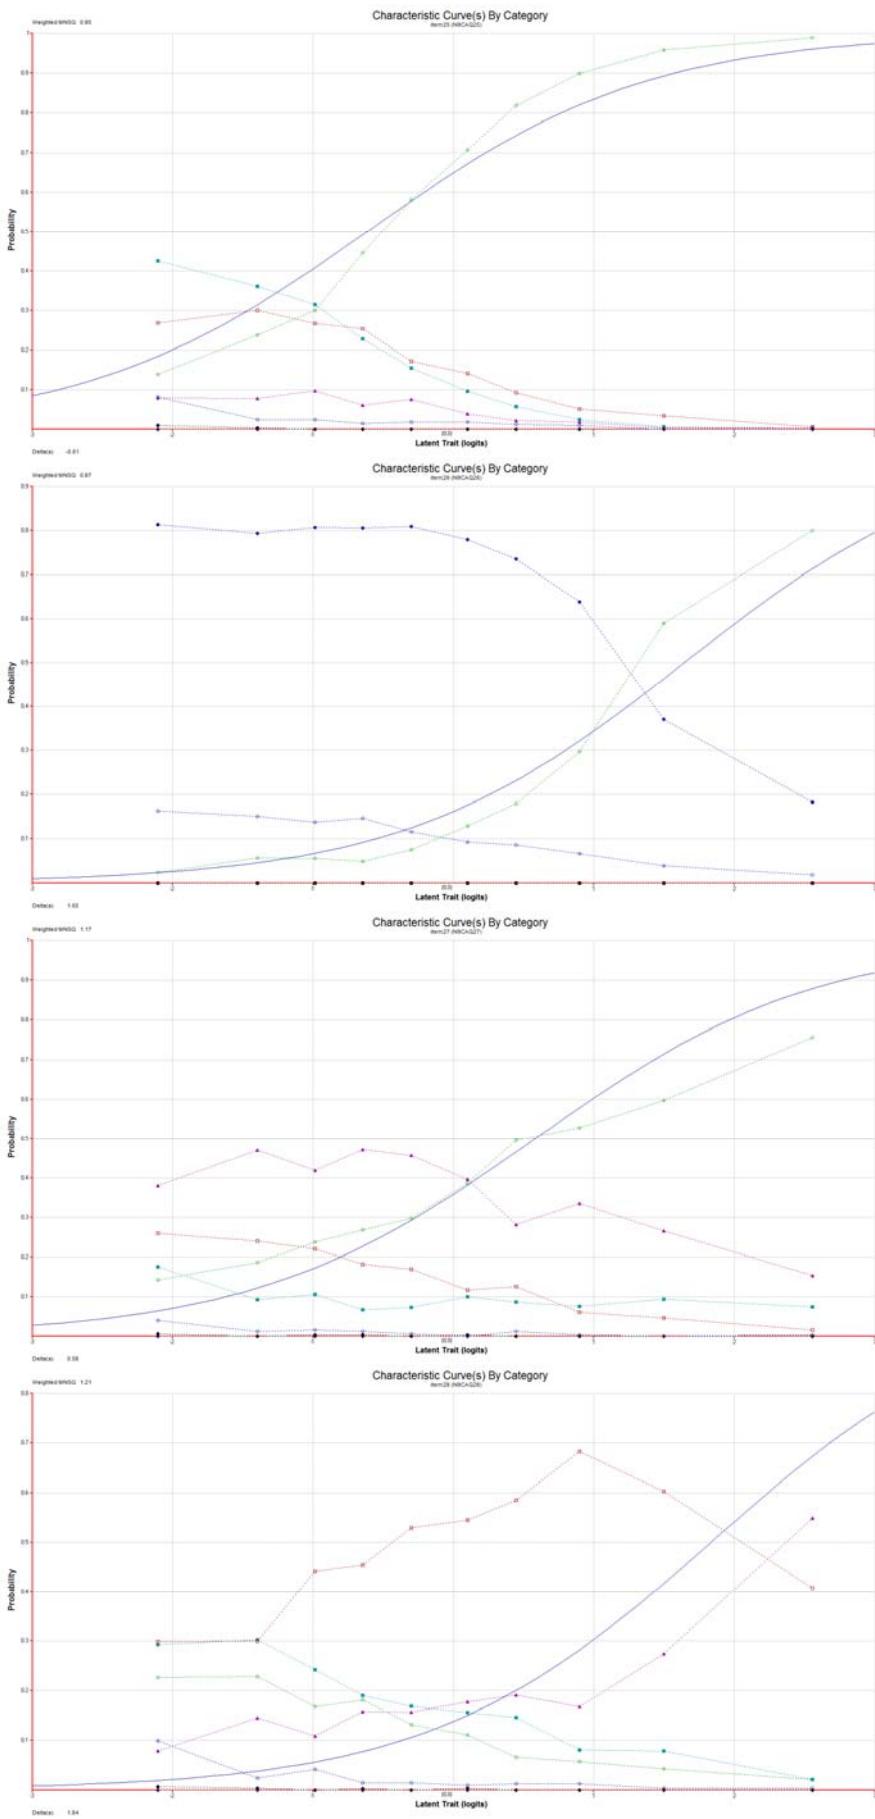

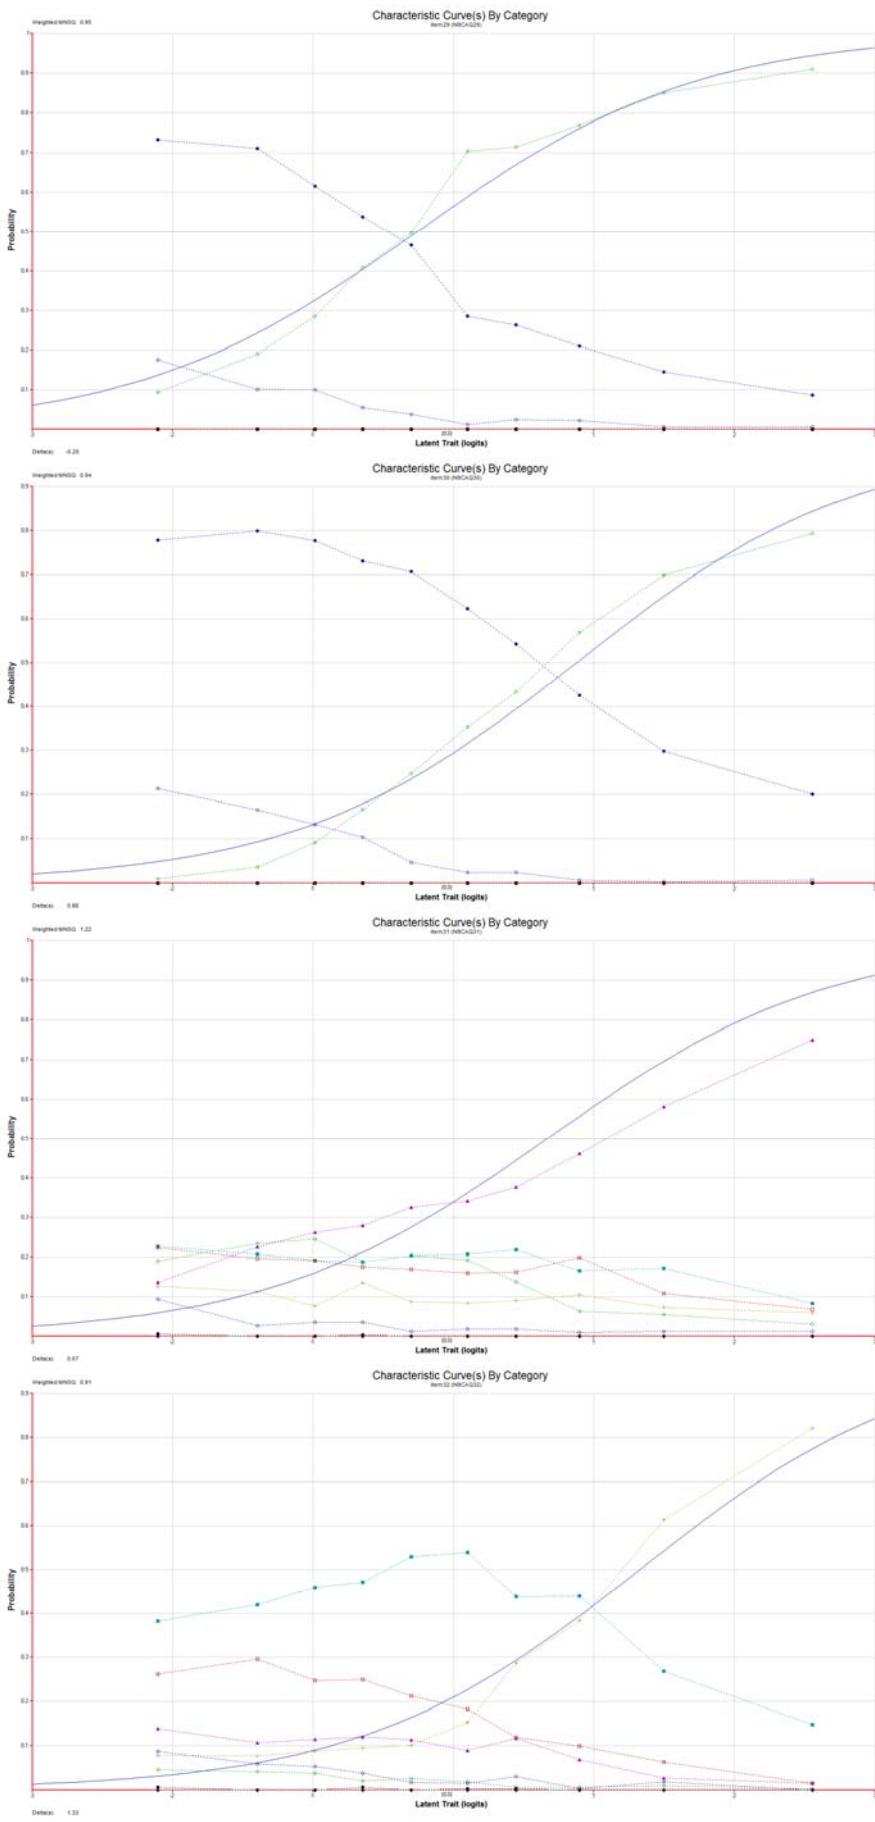

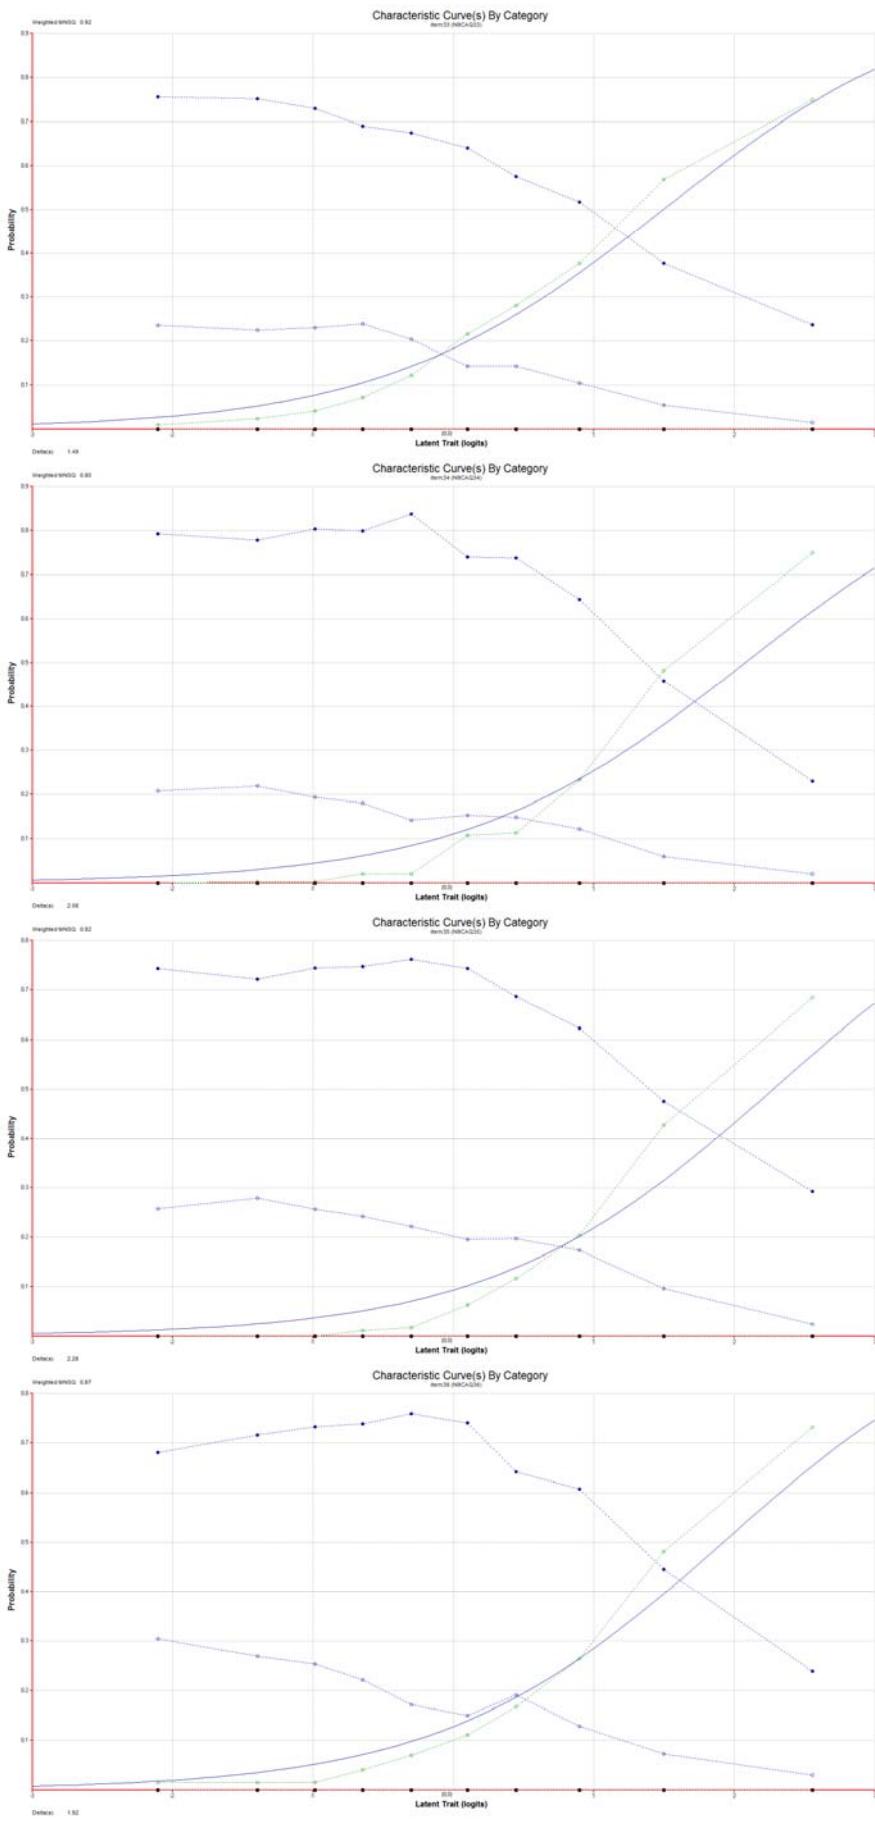

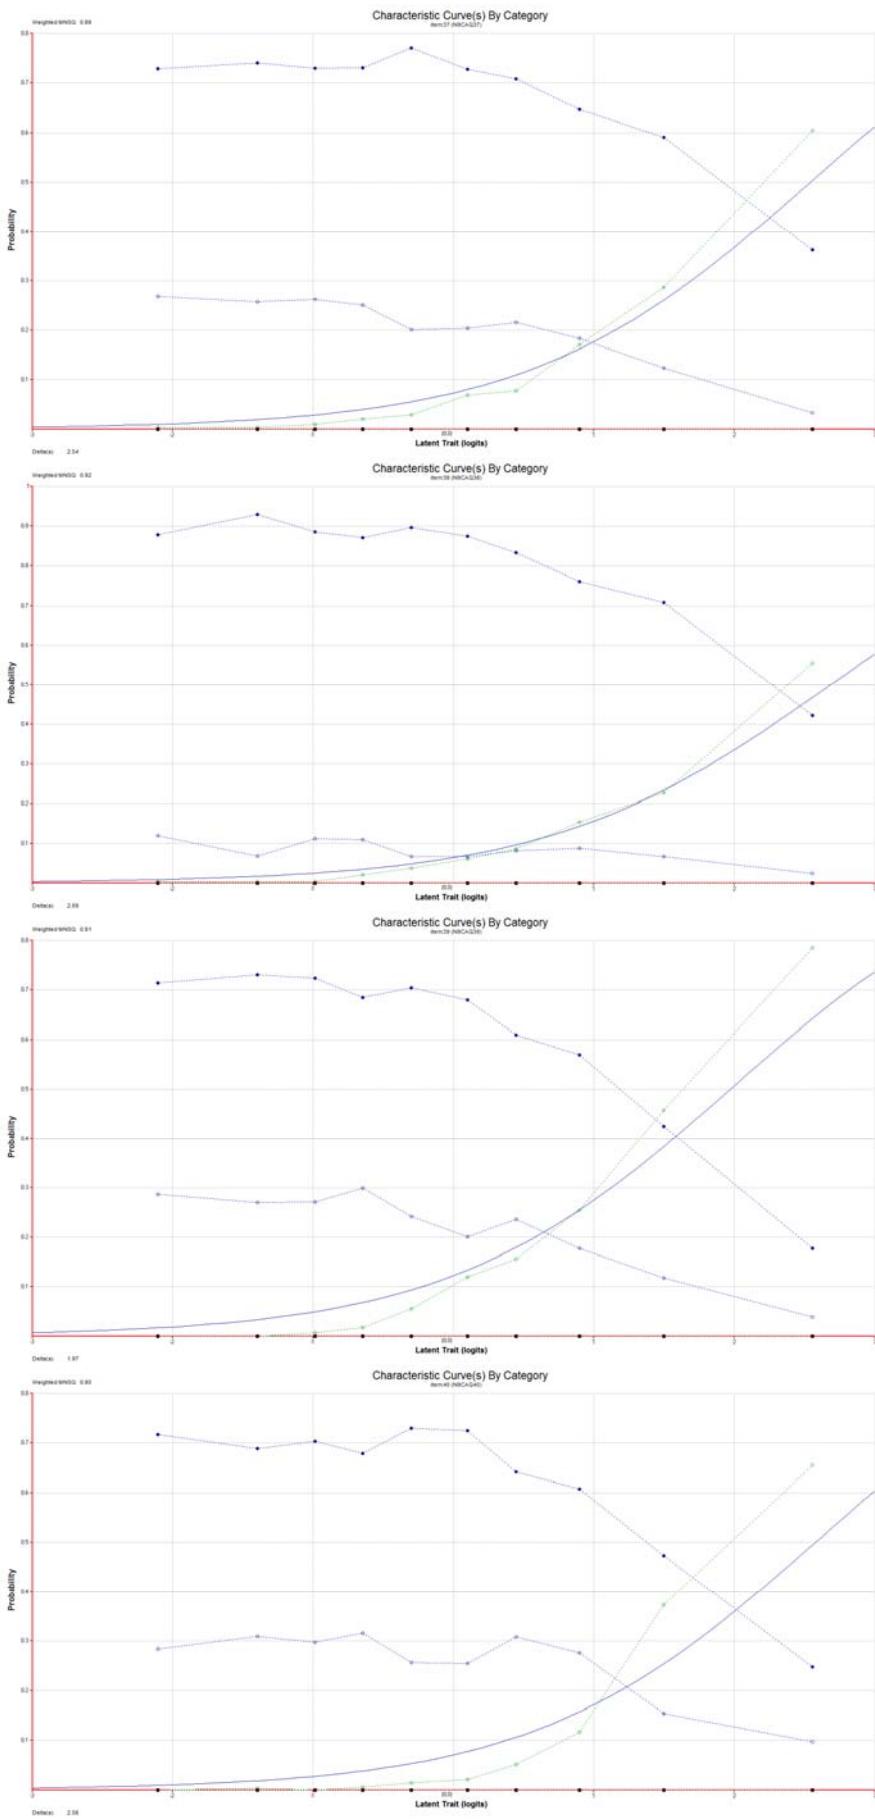

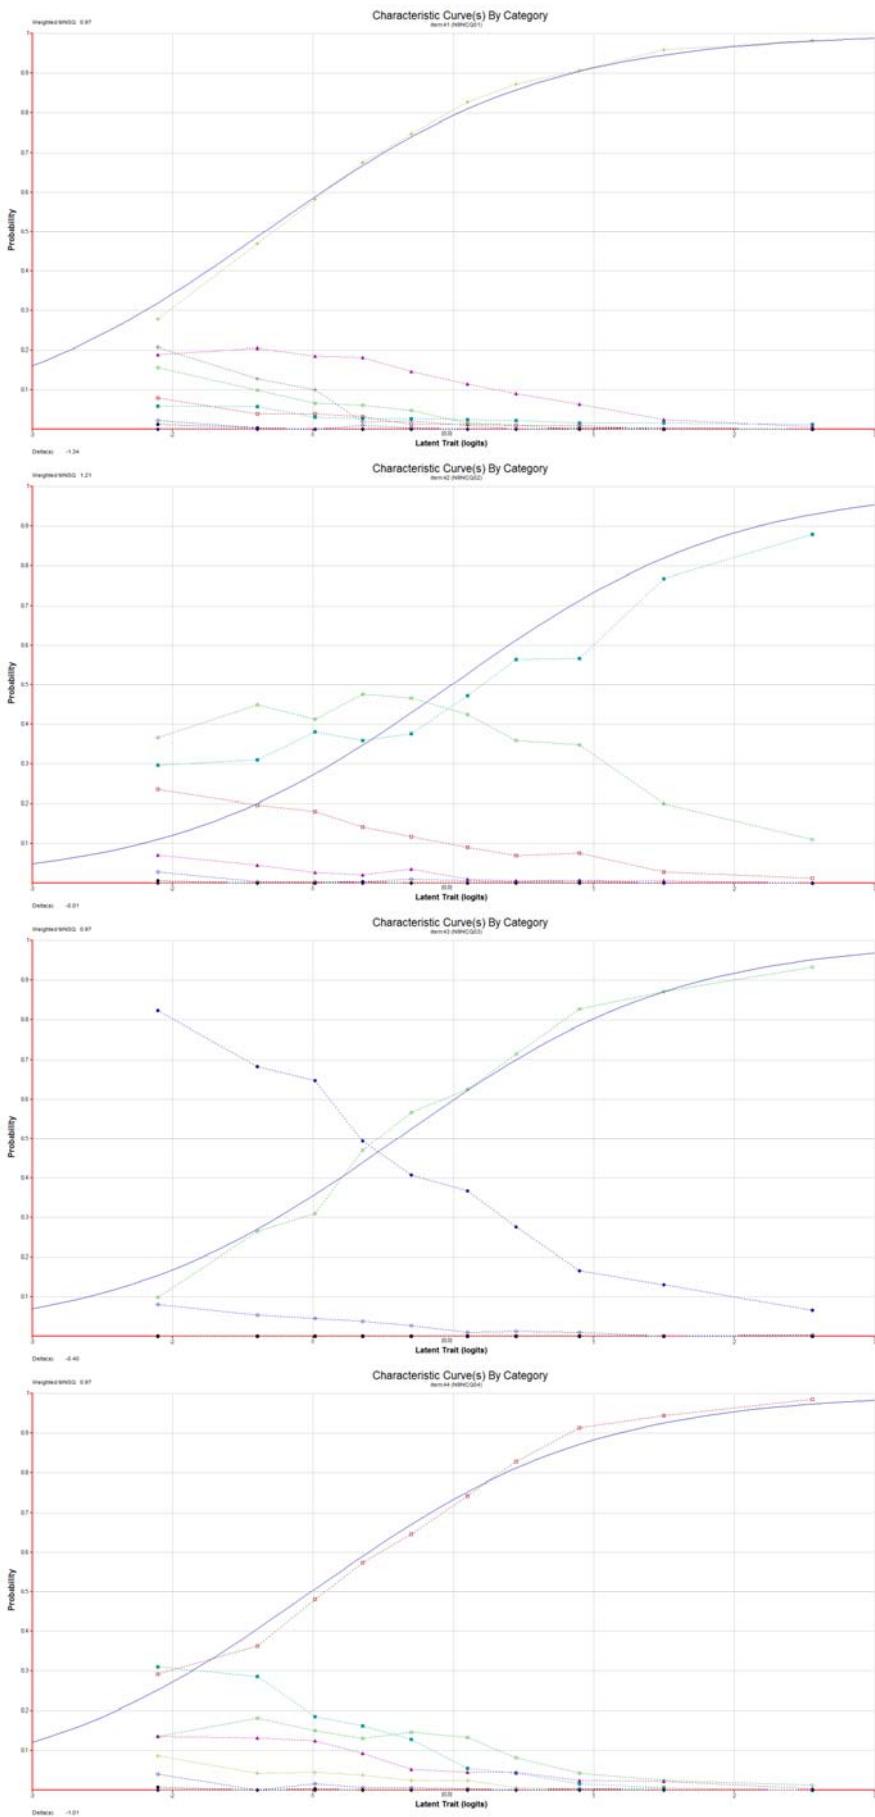

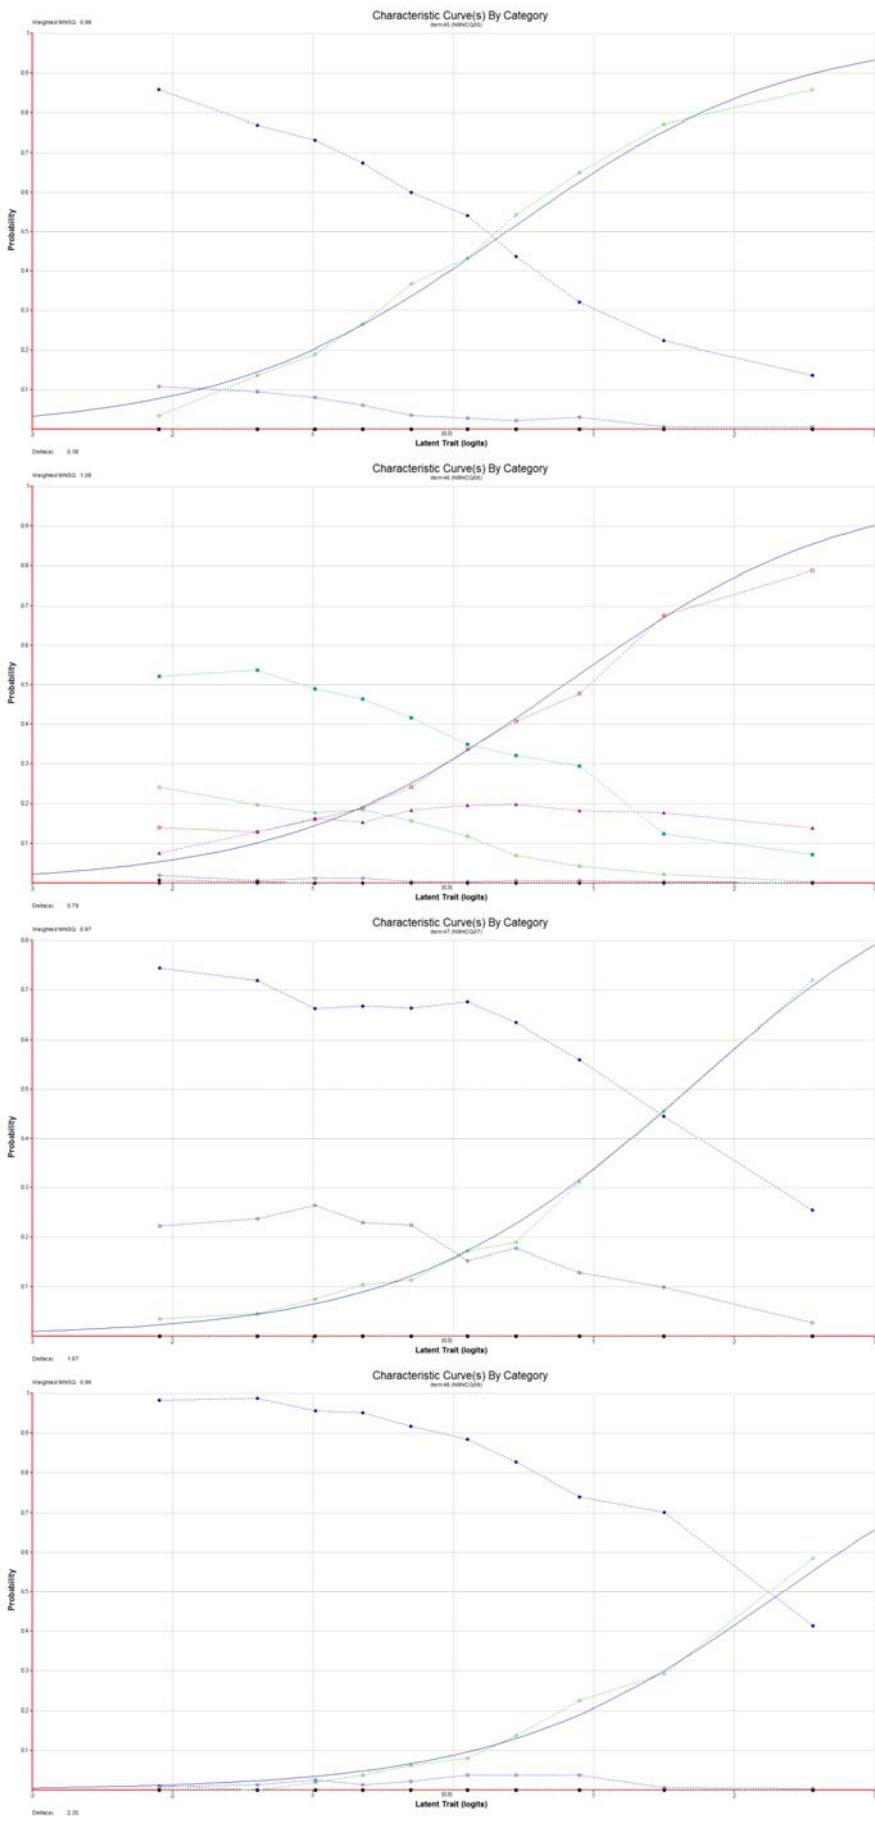

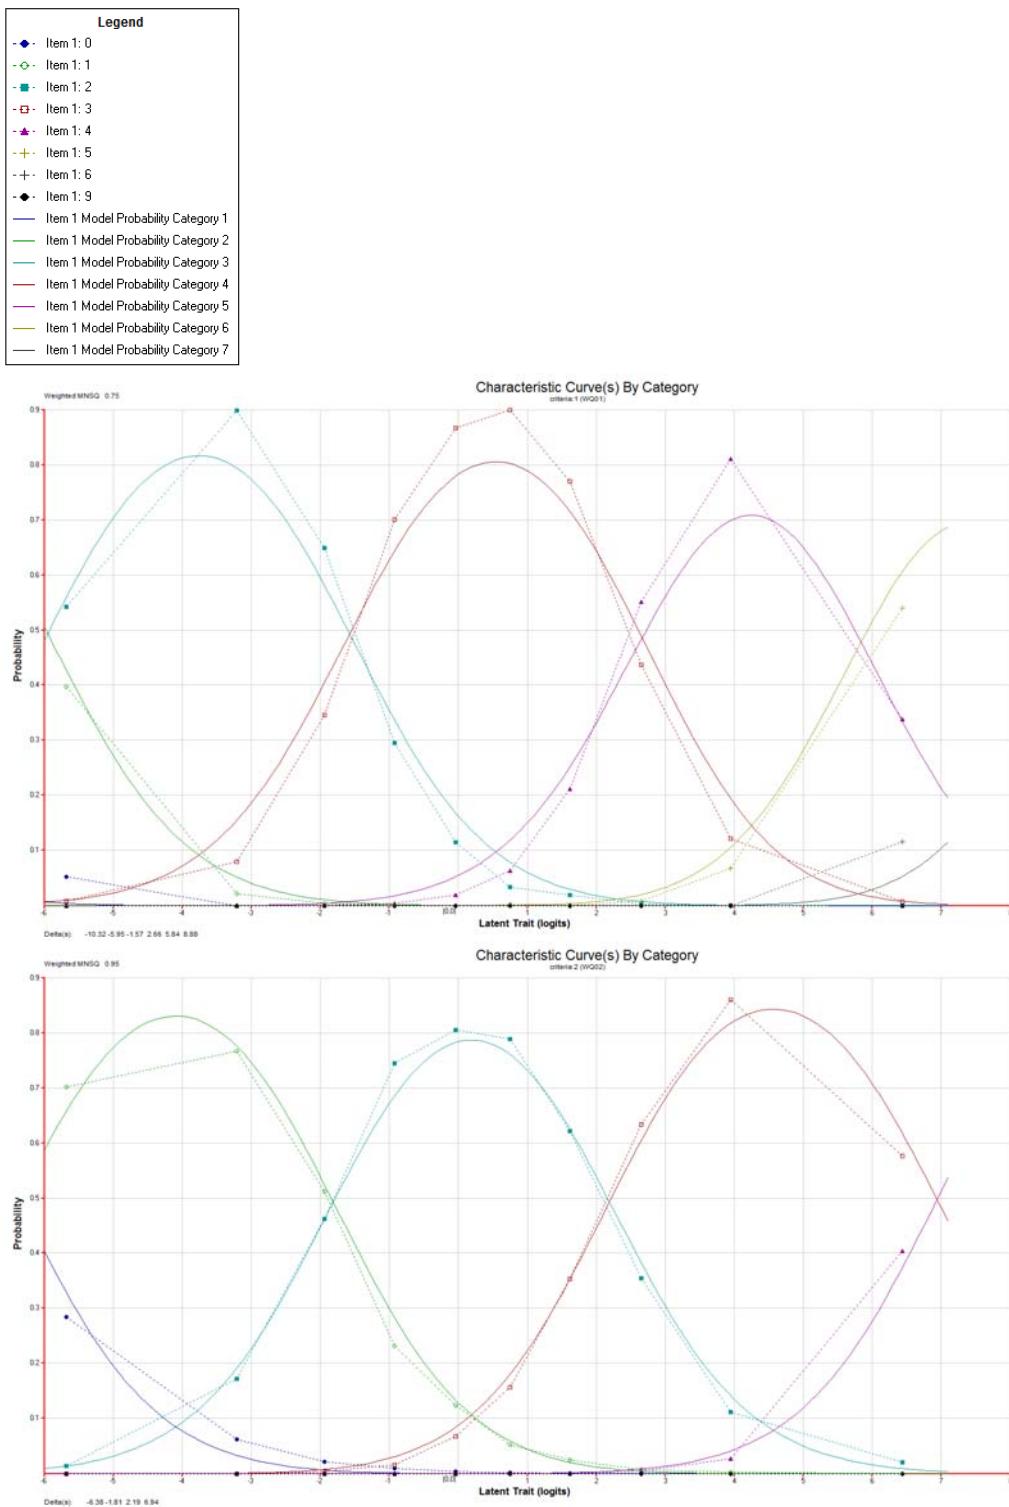

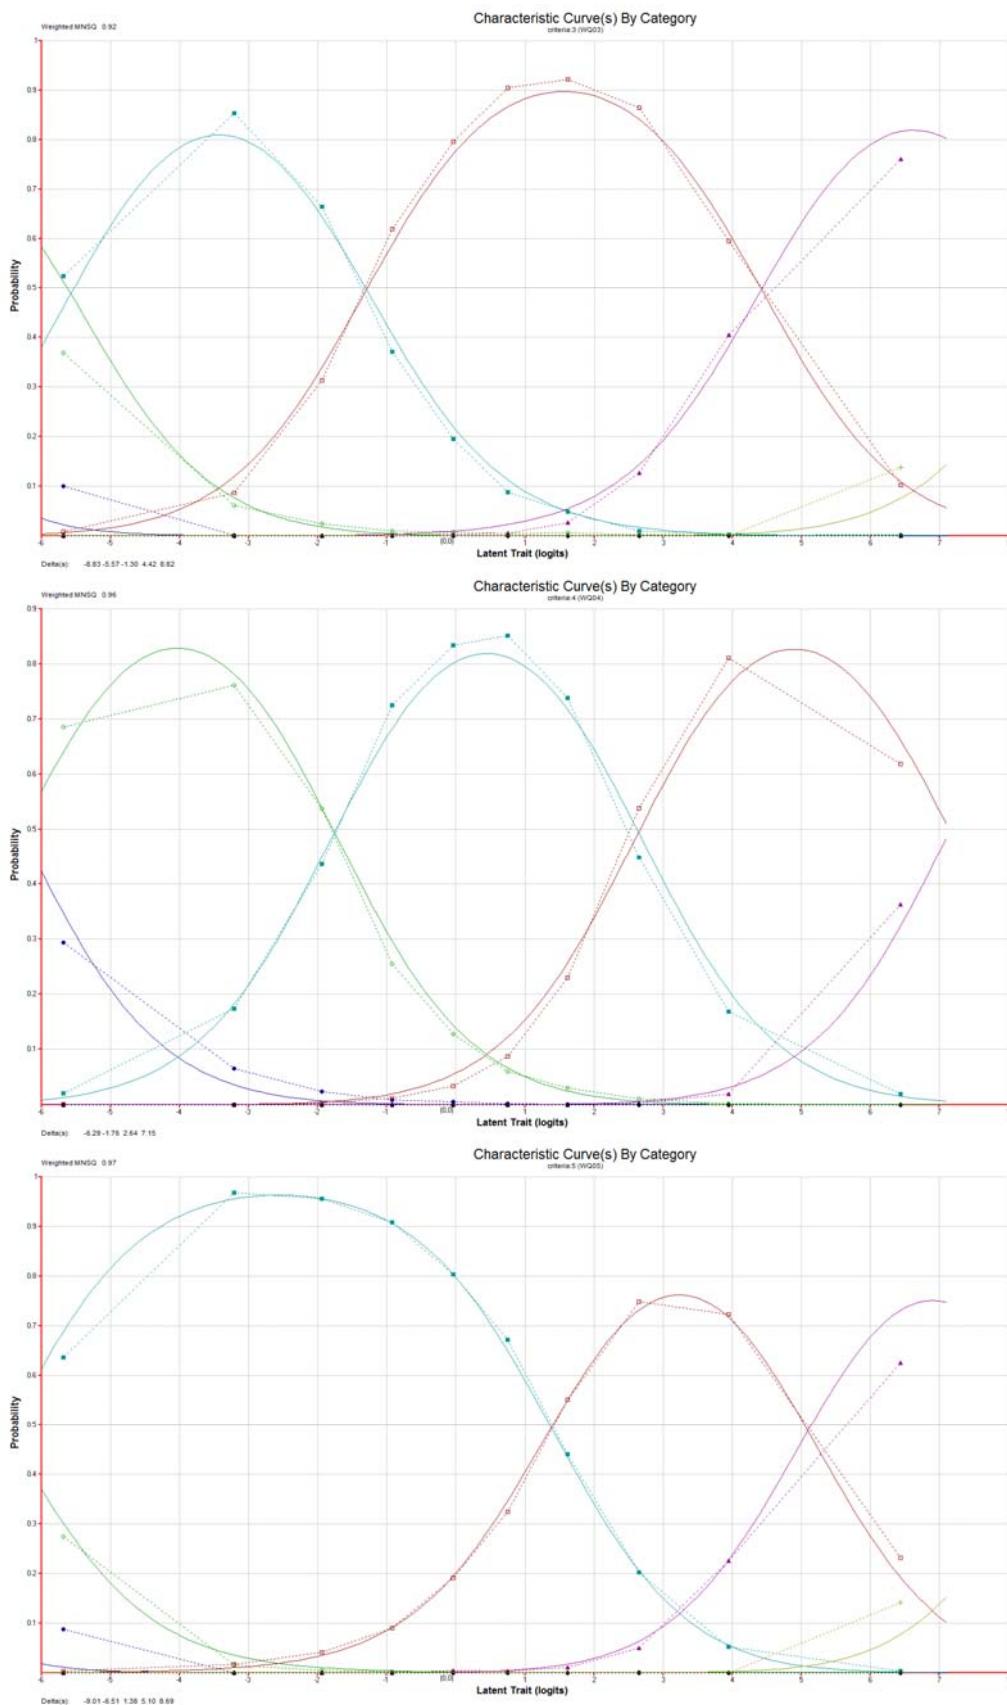

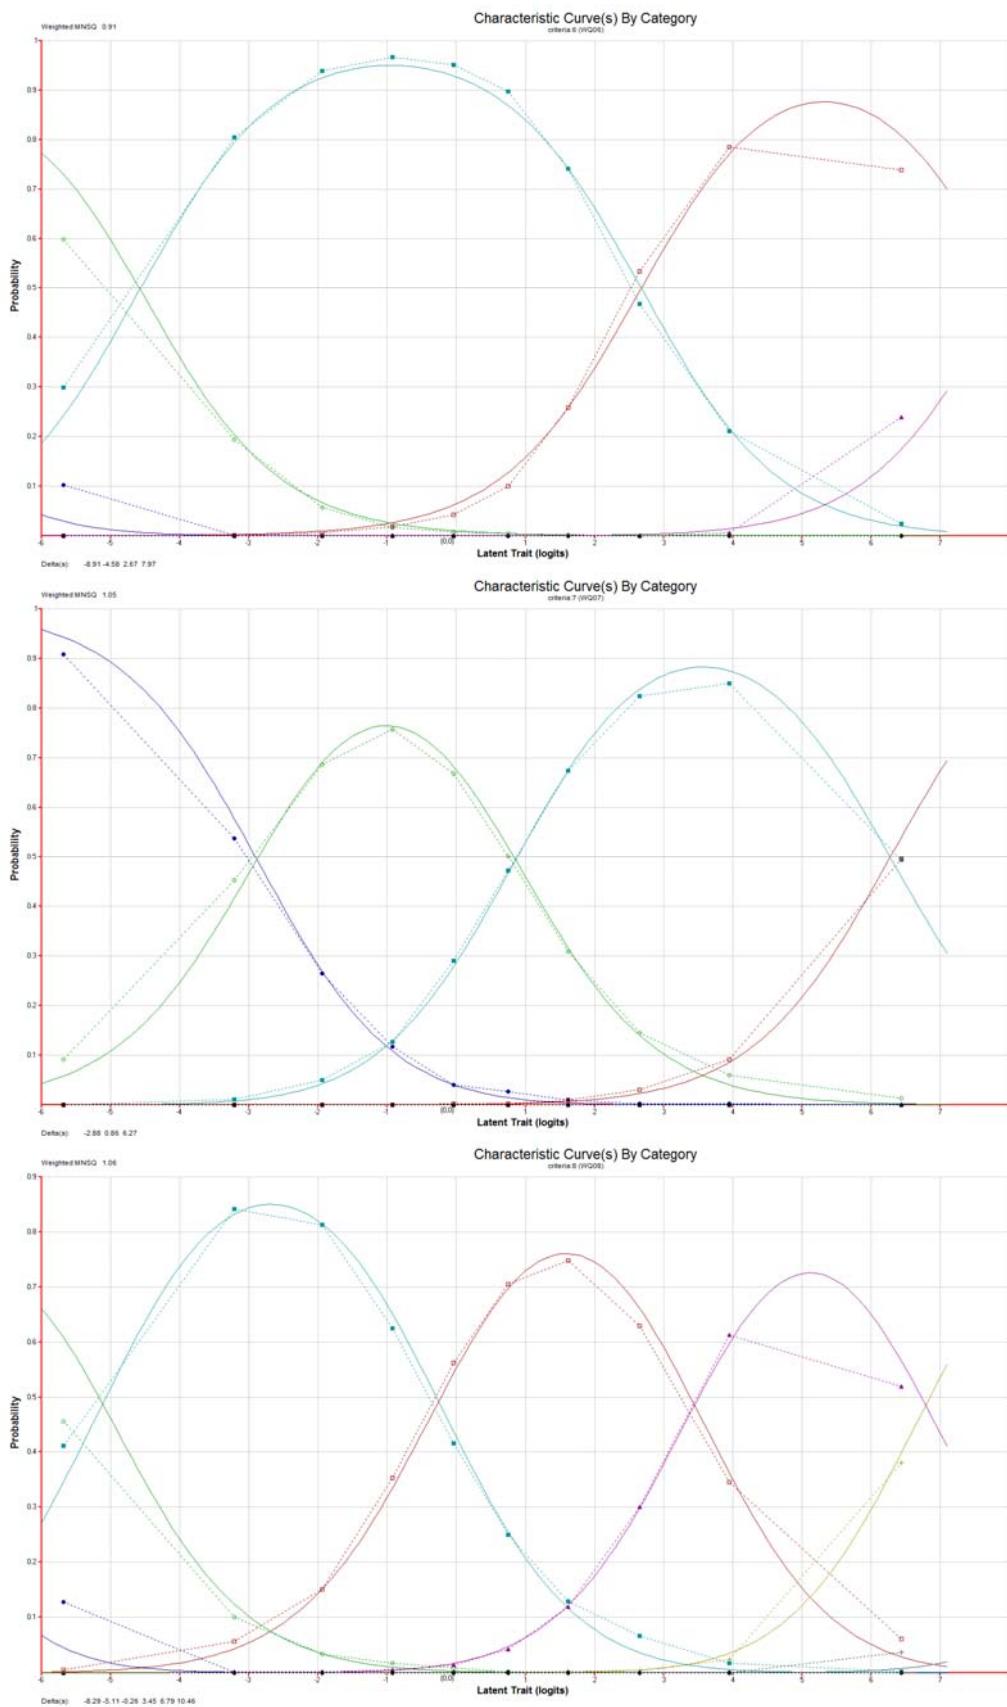

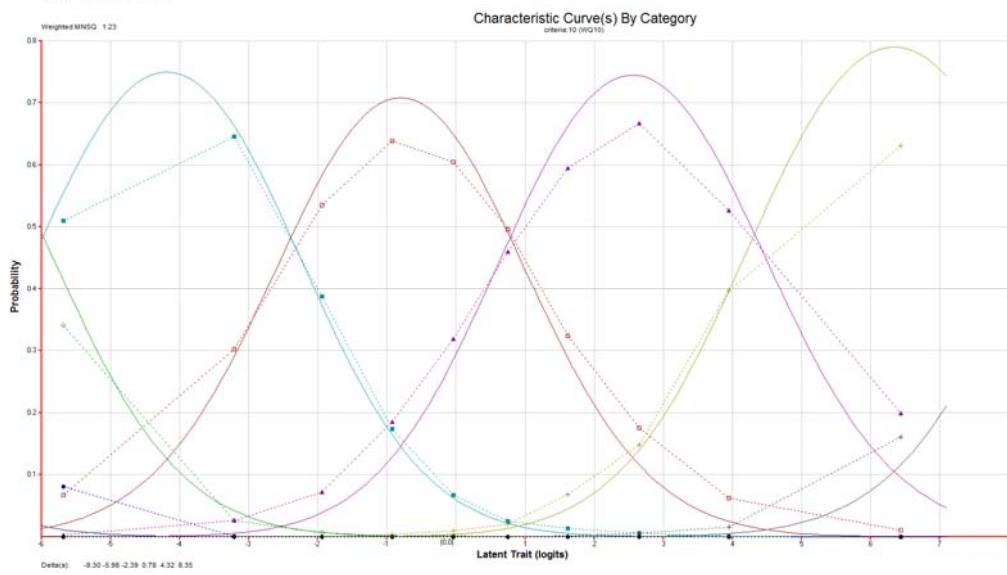

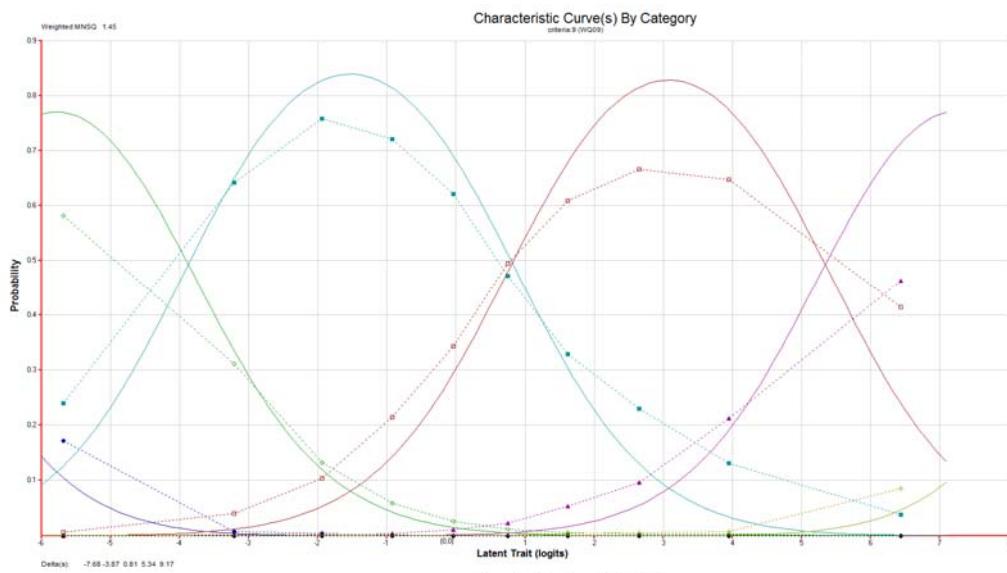

## D.17. Year 3, 5, 7, 9 Writing

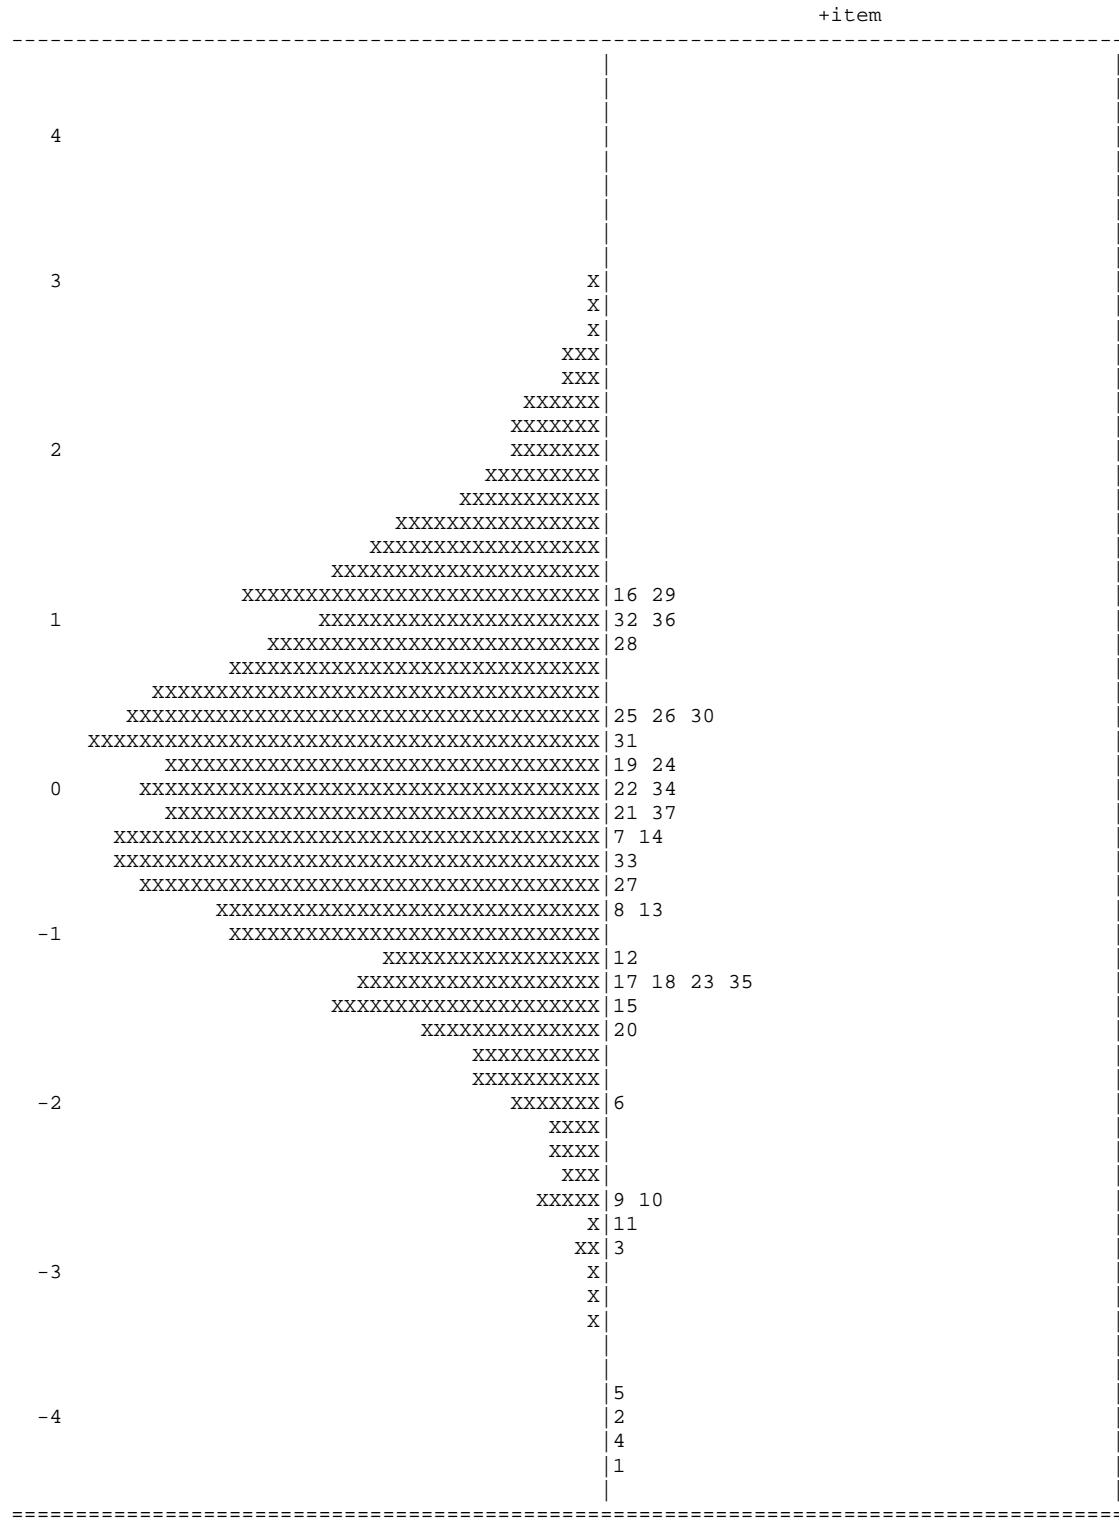

## APPENDIX E. VARIABLE MAPS

### E.1 Year 3 Reading Variable Map

## E.2 Year 5 Reading Variable Map

=====
NAPLAN 2017 Reading Year 5 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES  
=====
Terms in the Model (excl Step terms)

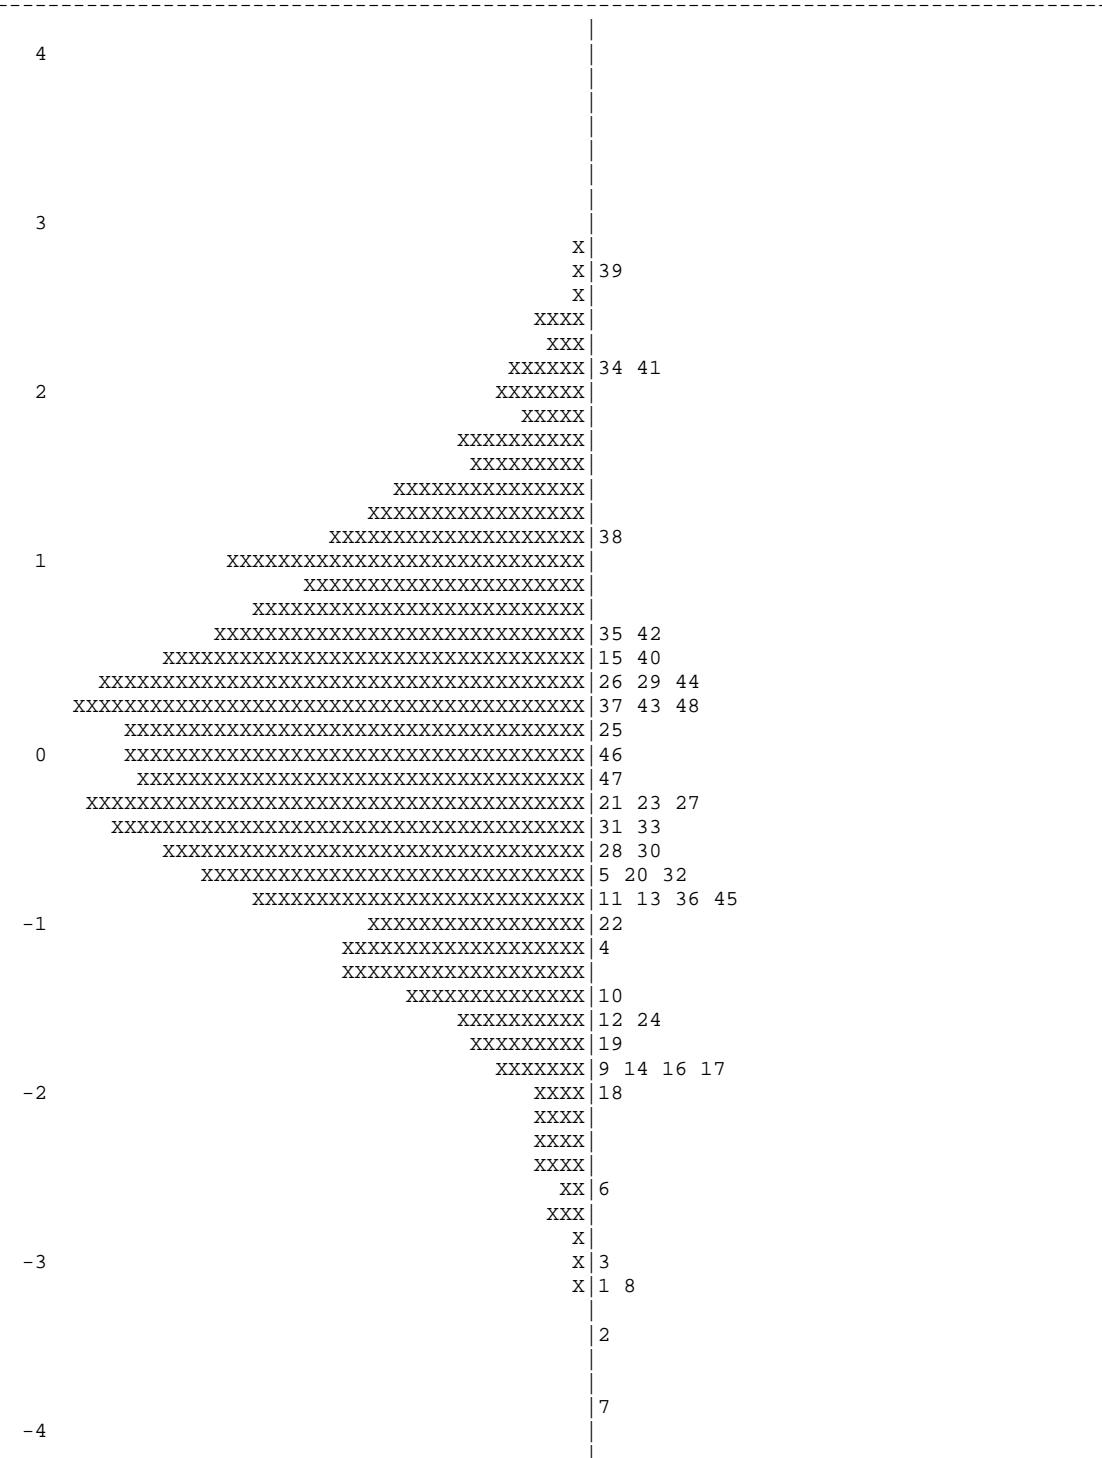

=====
Each 'X' represents 7.2 cases

### E.3 Year 7 Reading Variable Map

=====
NAPLAN 2017 Reading Year 7 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES  
=====

Terms in the Model (excl Step terms)

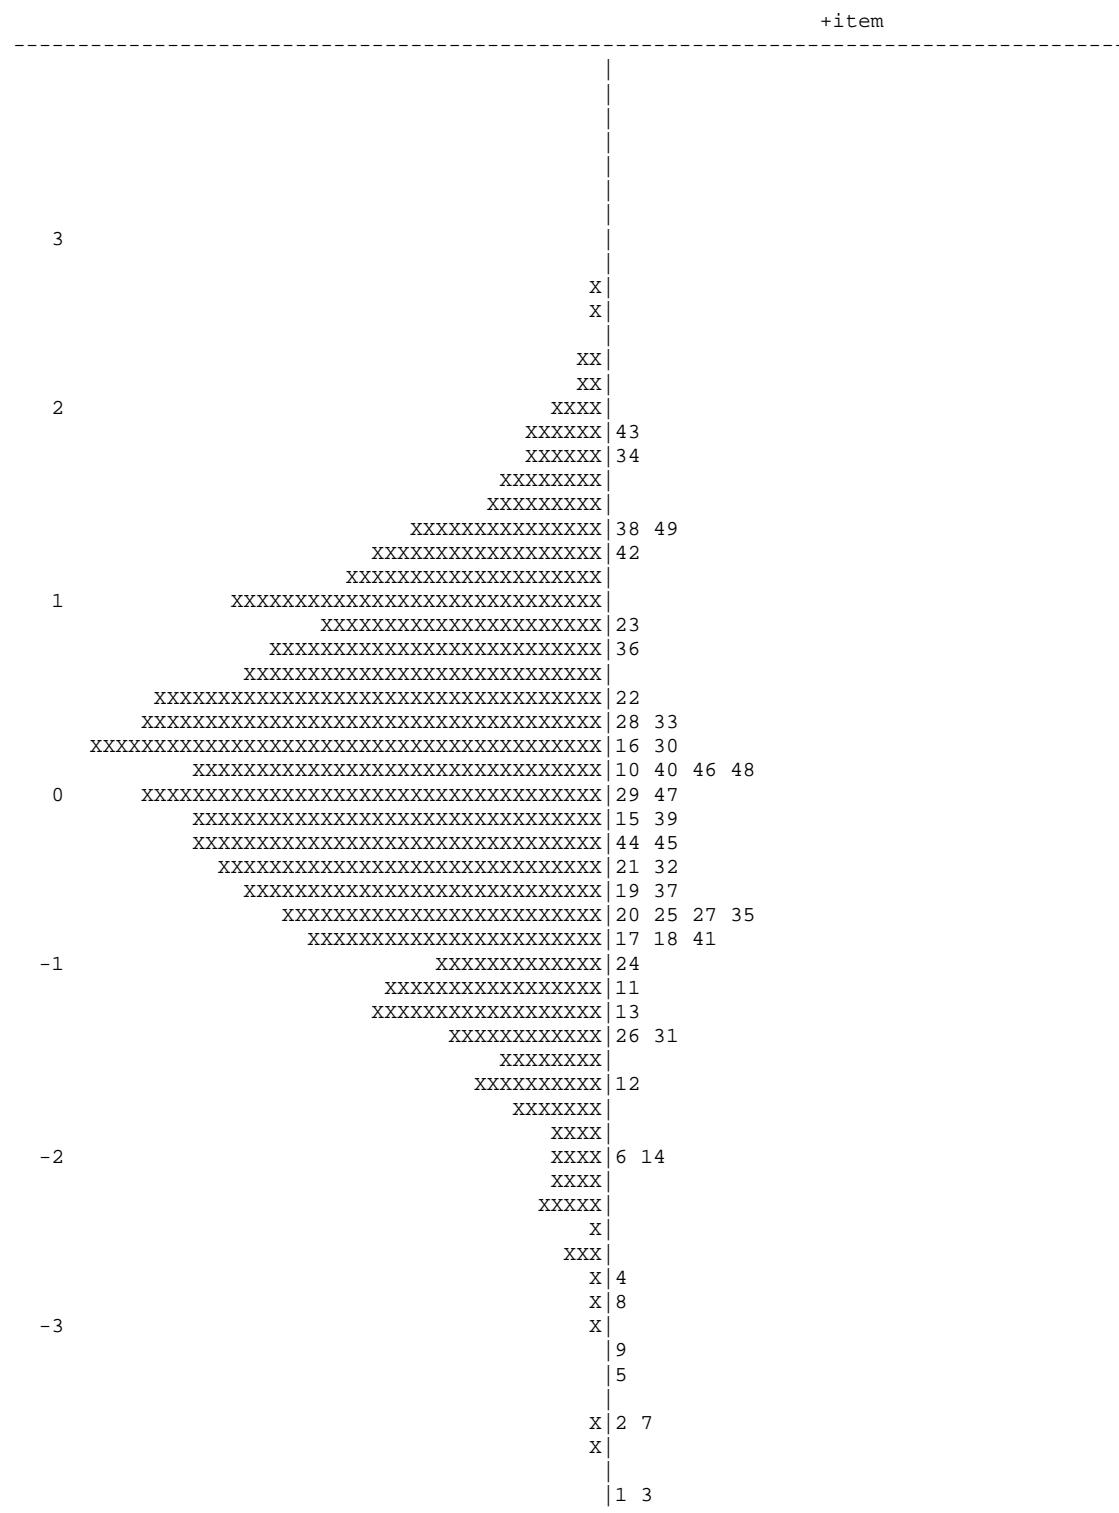

+item

=====  
Each 'X' represents 5.5 cases

## E.4 Year 9 Reading Variable Map

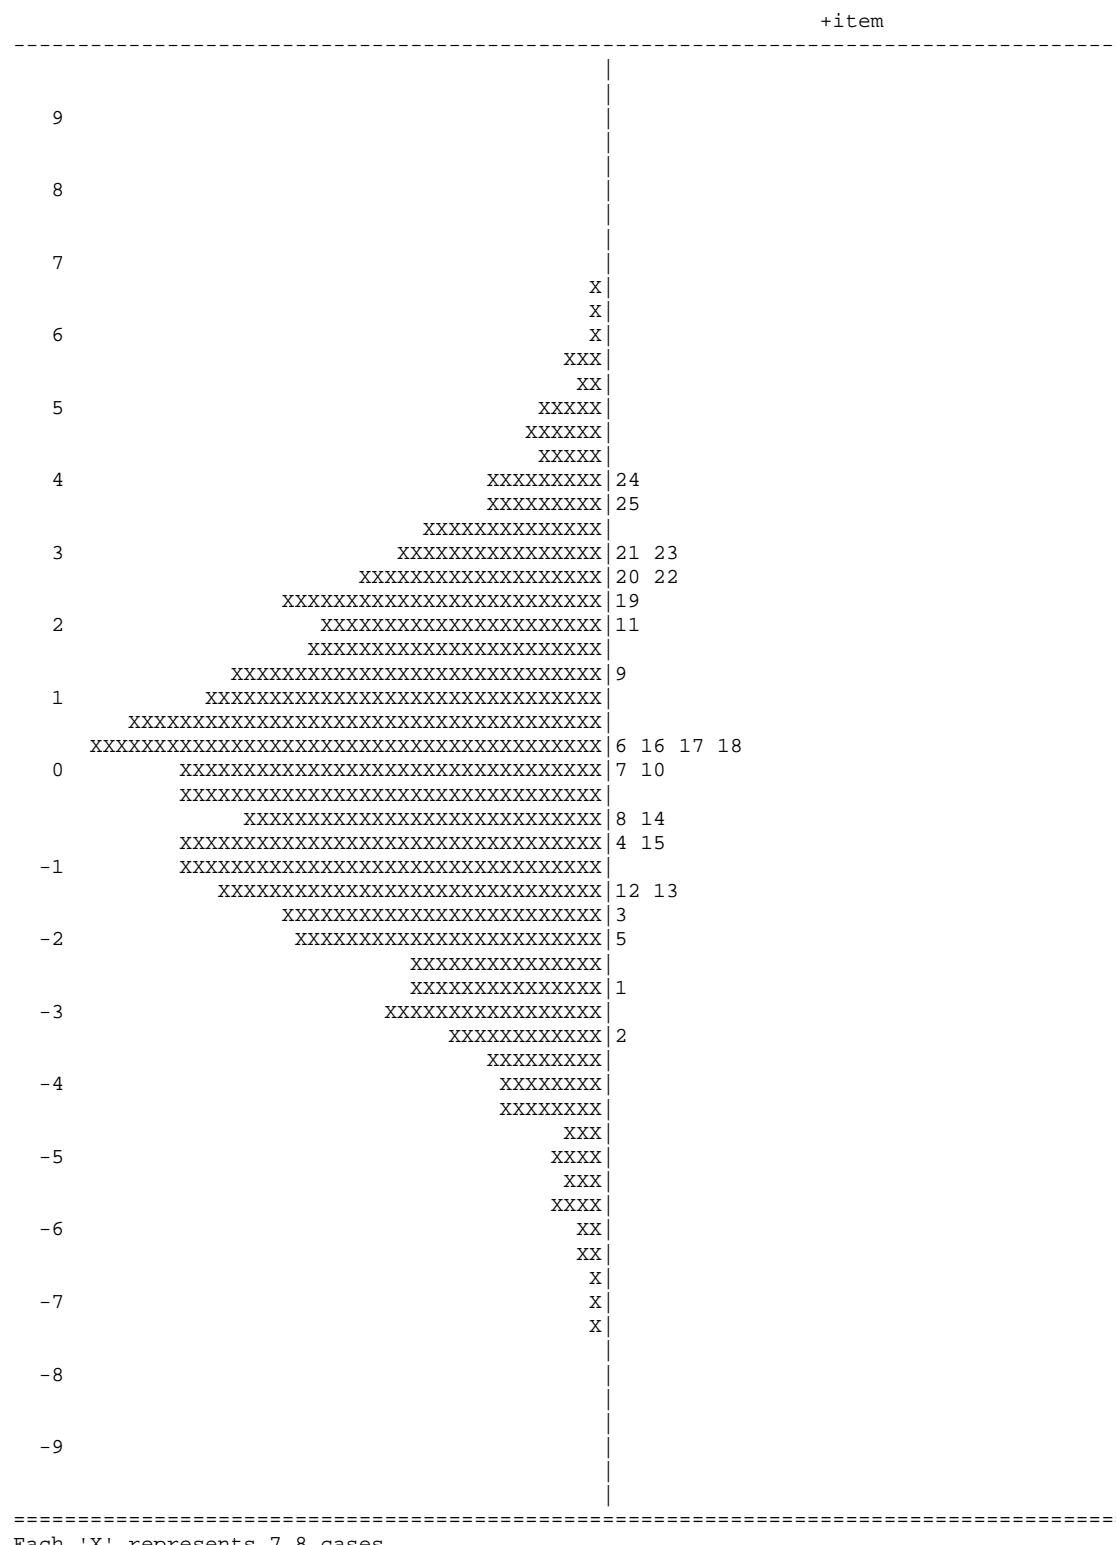

=====
NAPLAN 2017 Reading Year 9 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES  
=====
Terms in the Model (excl Step terms)

=====  
Each 'X' represents 5.8 cases

## E.5 Year 3 Spelling Variable Map

=====
NAPLAN 2017 Spelling Year 3 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES  
=====
Terms in the Model (excl Step terms)

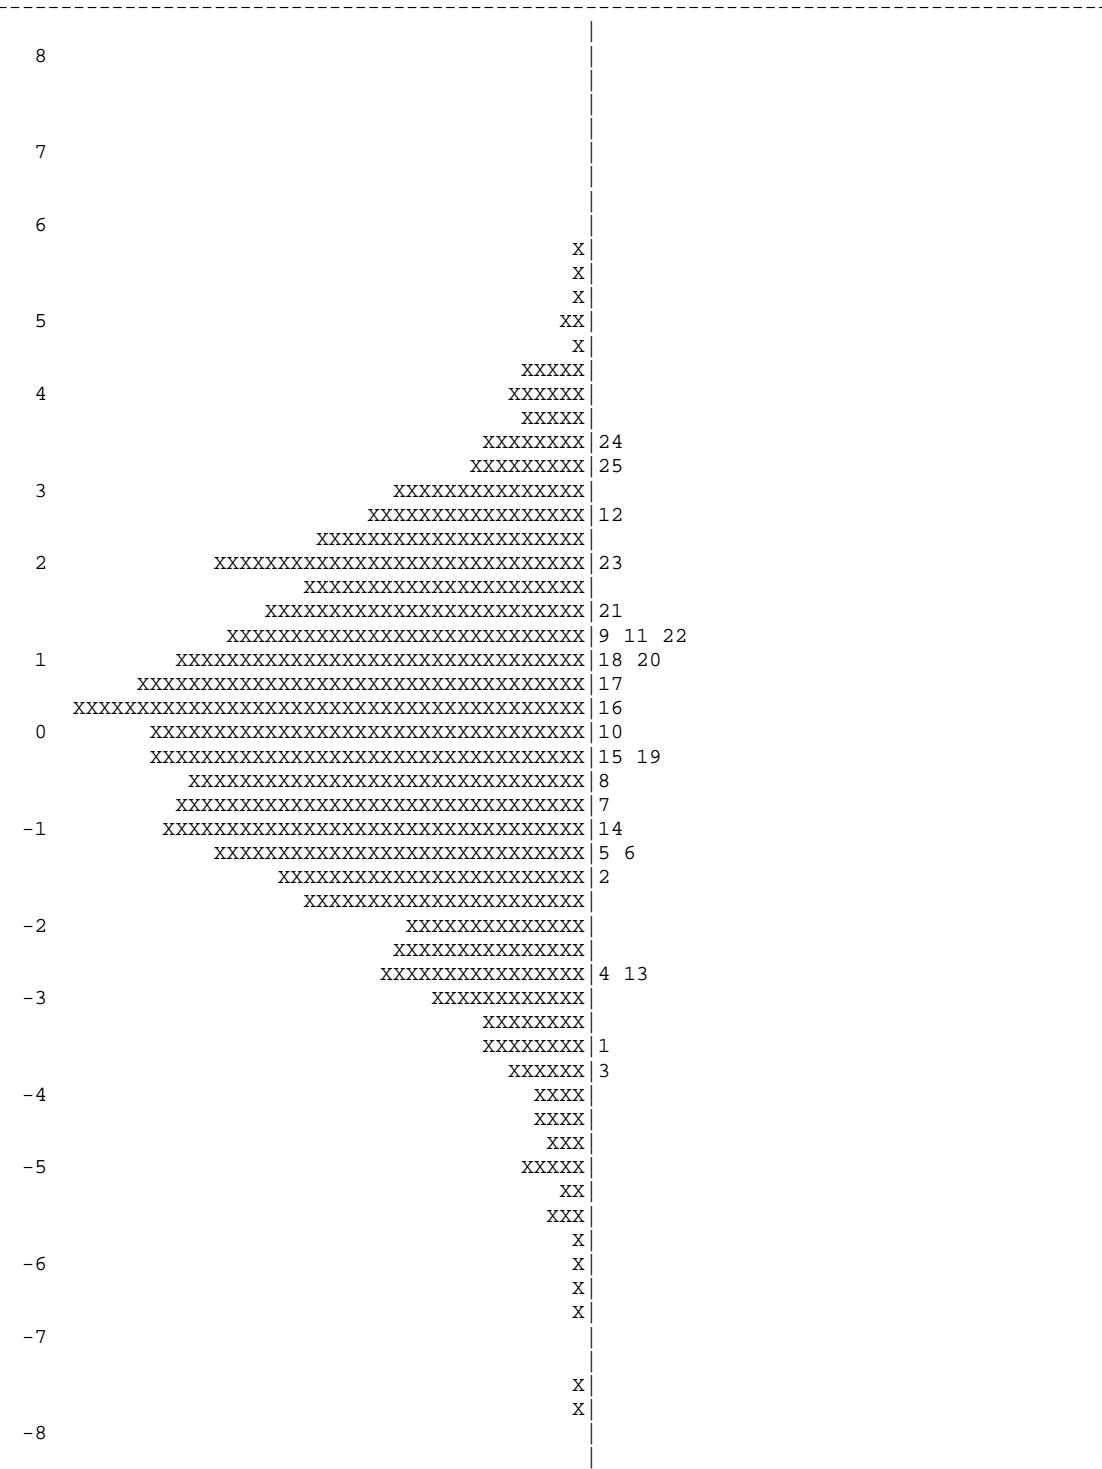

## E.6 Year 5 Spelling Variable Map

=====
NAPLAN 2017 Spelling Year 5 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES  
=====

Terms in the Model (excl Step terms)

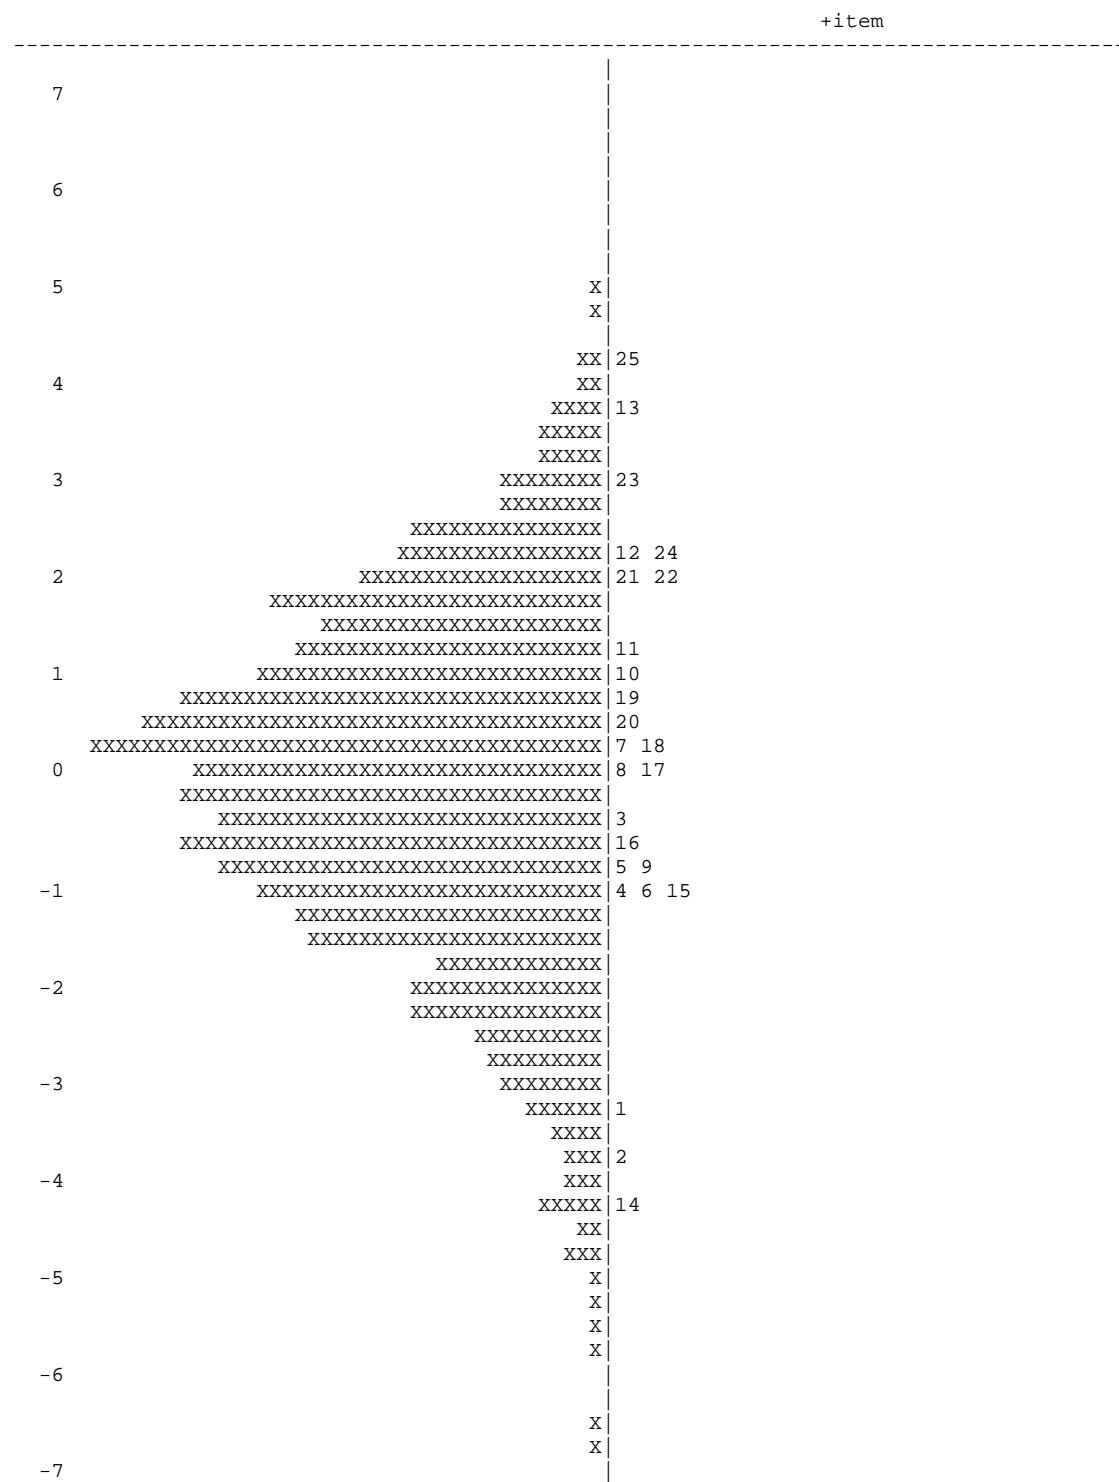

+item

=====  
Each 'X' represents 7.9 cases

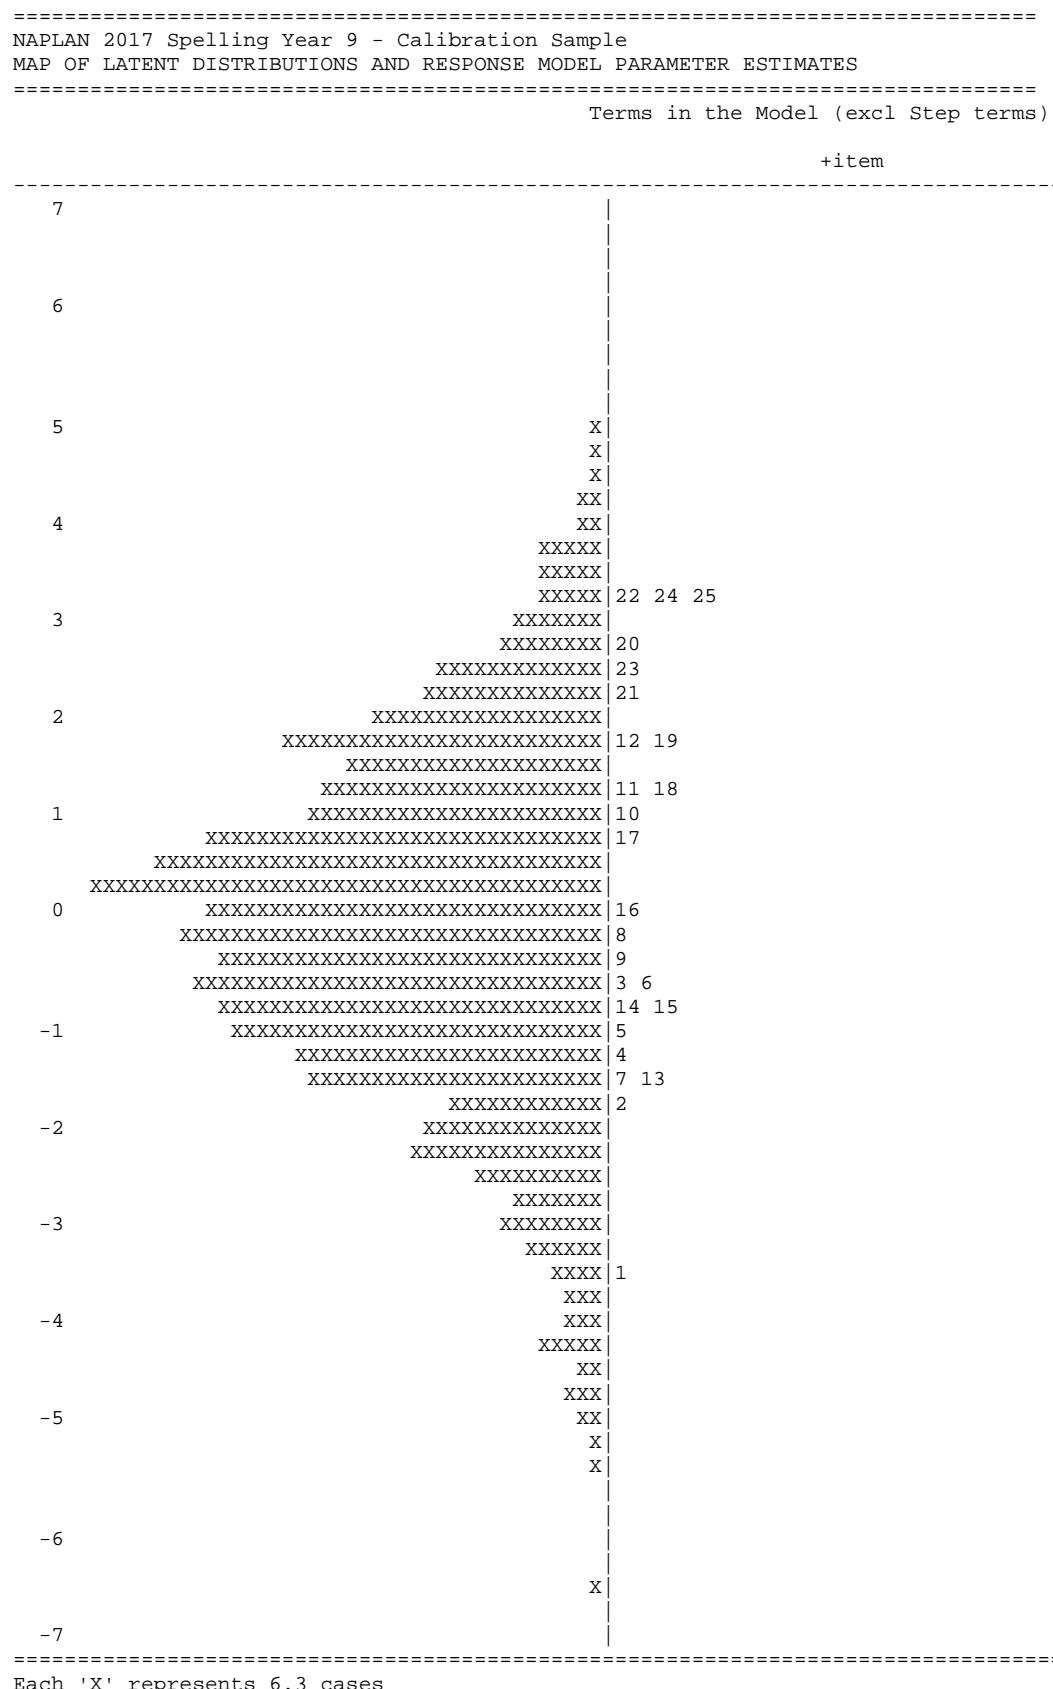

## E.7 Year 7 Spelling Variable Map

=====
NAPLAN 2017 Spelling Year 7 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES  
=====
Terms in the Model (excl Step terms)

=====  
Each 'X' represents 6.2 cases

## E.8 Year 9 Spelling Variable Map

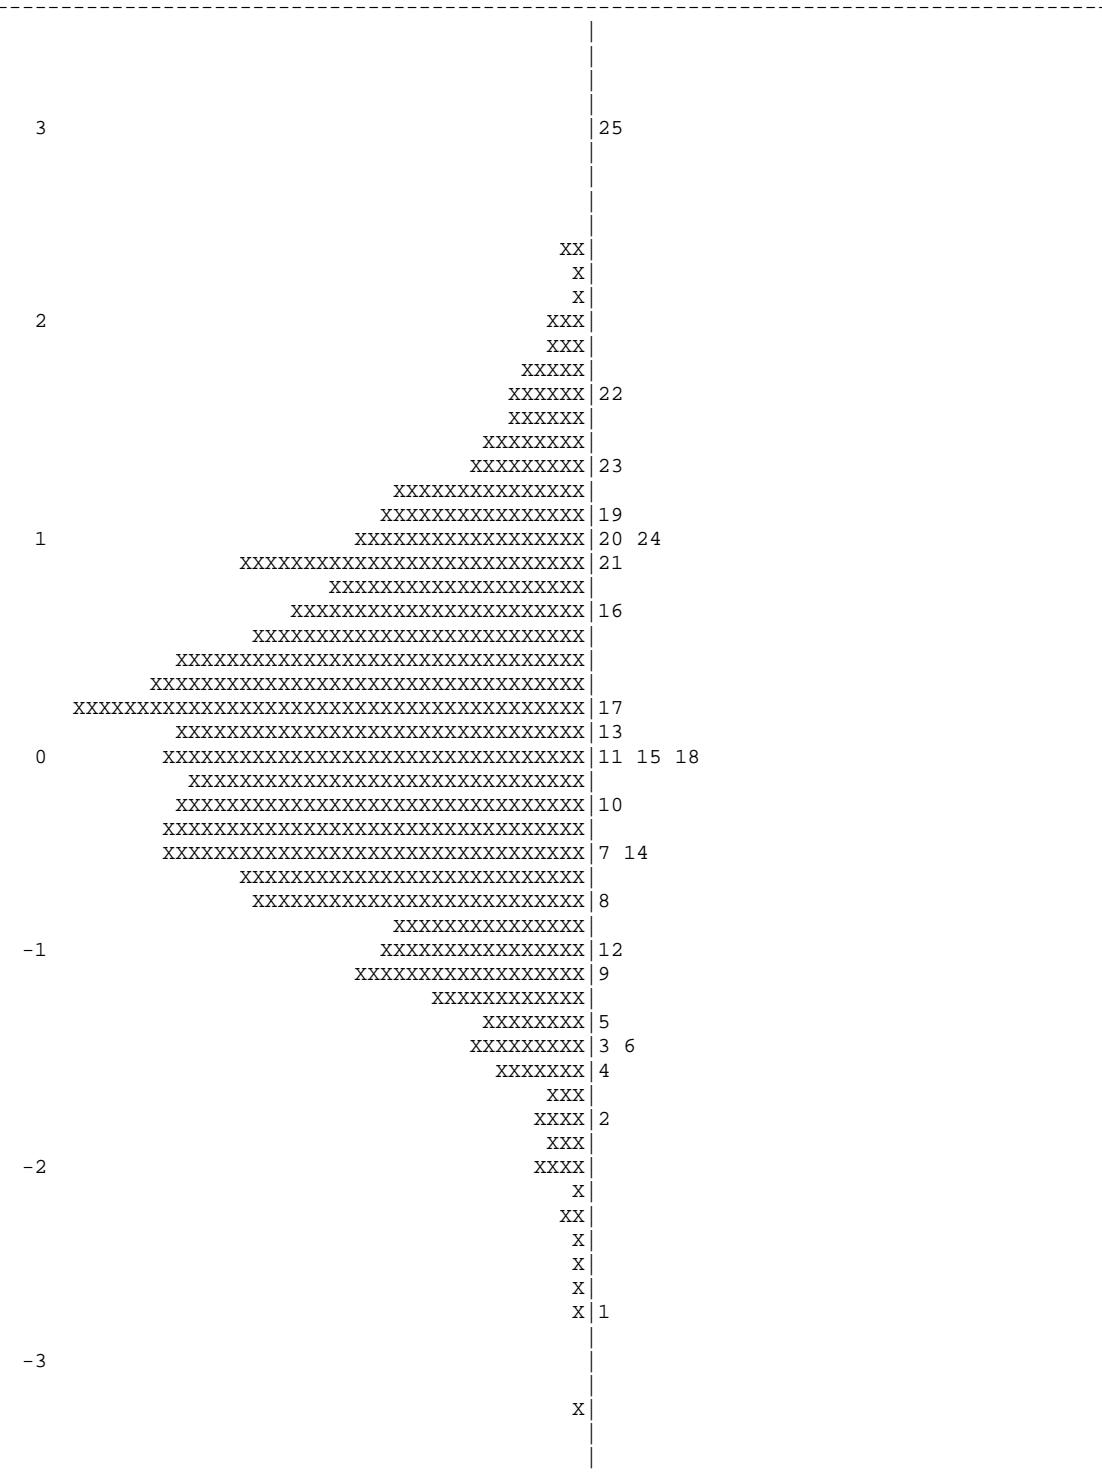

## E.9 Year 3 Grammar and Punctuation Variable Map

=====
NAPLAN 2017 Grammar Punctuation Year 3 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES
=====

Terms in the Model (excl Step terms)

+item

=====
Each 'X' represents 7.8 cases
=====

## E.10 Year 5 Grammar and Punctuation Variable Map

=====
NAPLAN 2017 Grammar Punctuation Year 5 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES
=====

Terms in the Model (excl Step terms)

+item

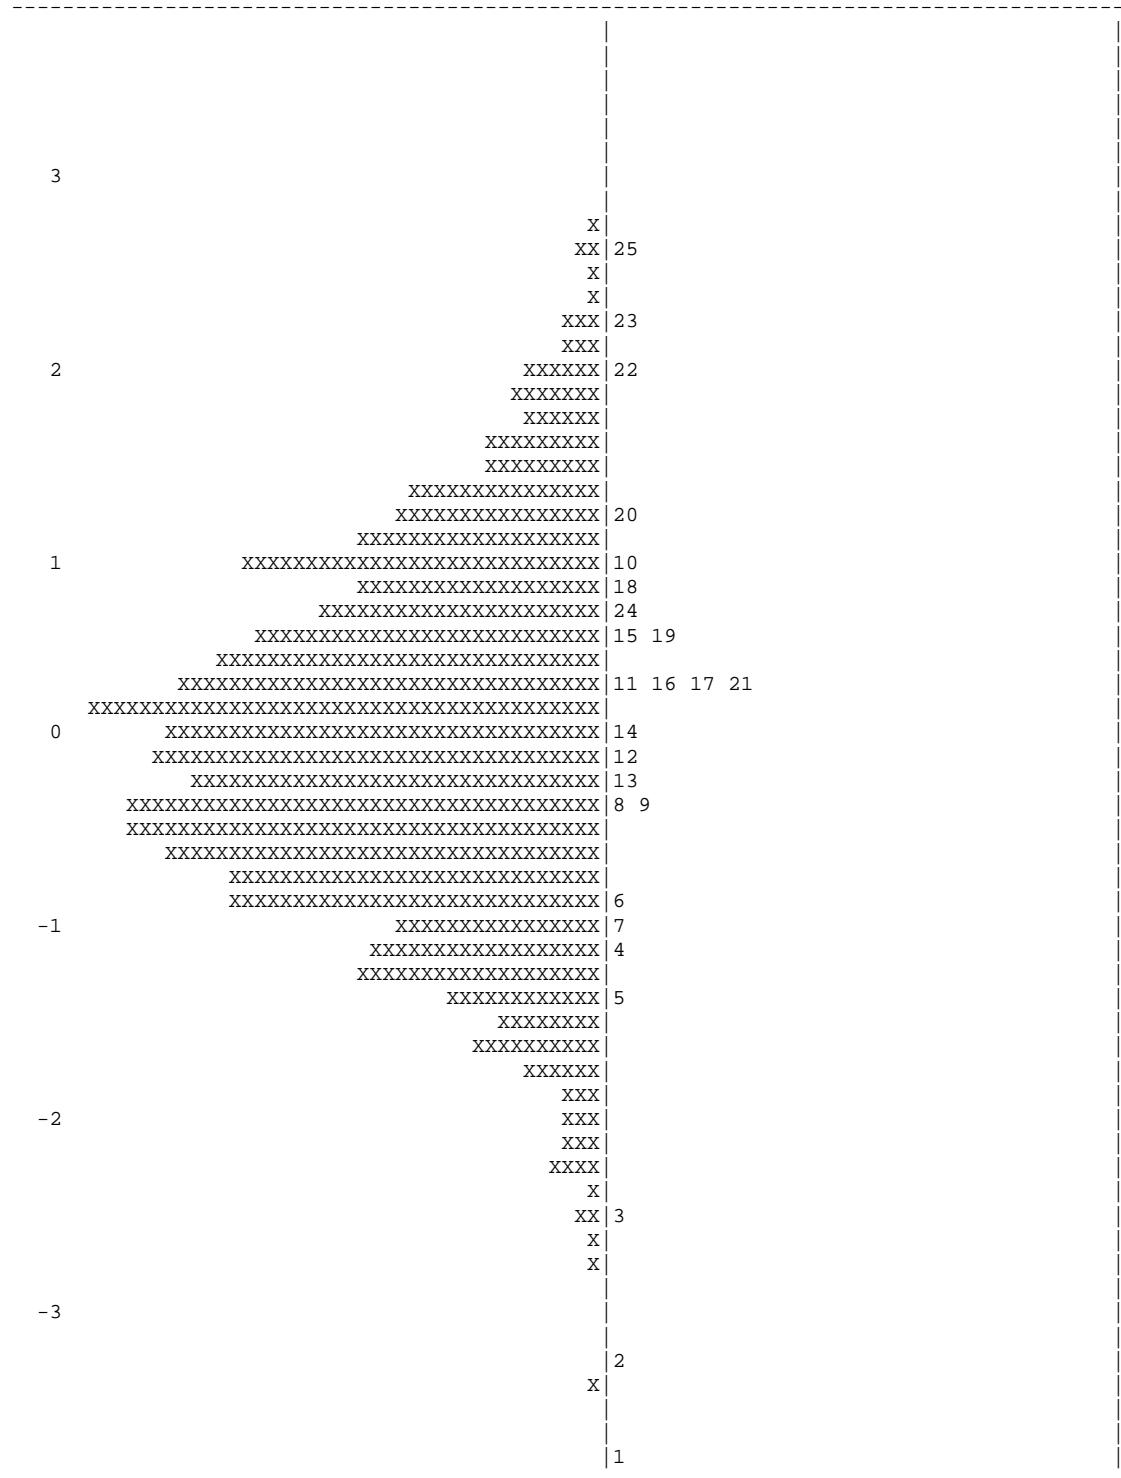

=====
Each 'X' represents 7.3 cases
=====

## E.11 Year 7 Grammar and Punctuation Variable Map

=====
NAPLAN 2017 Grammar Punctuation Year 7 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES
=====

Terms in the Model (excl Step terms)

+item

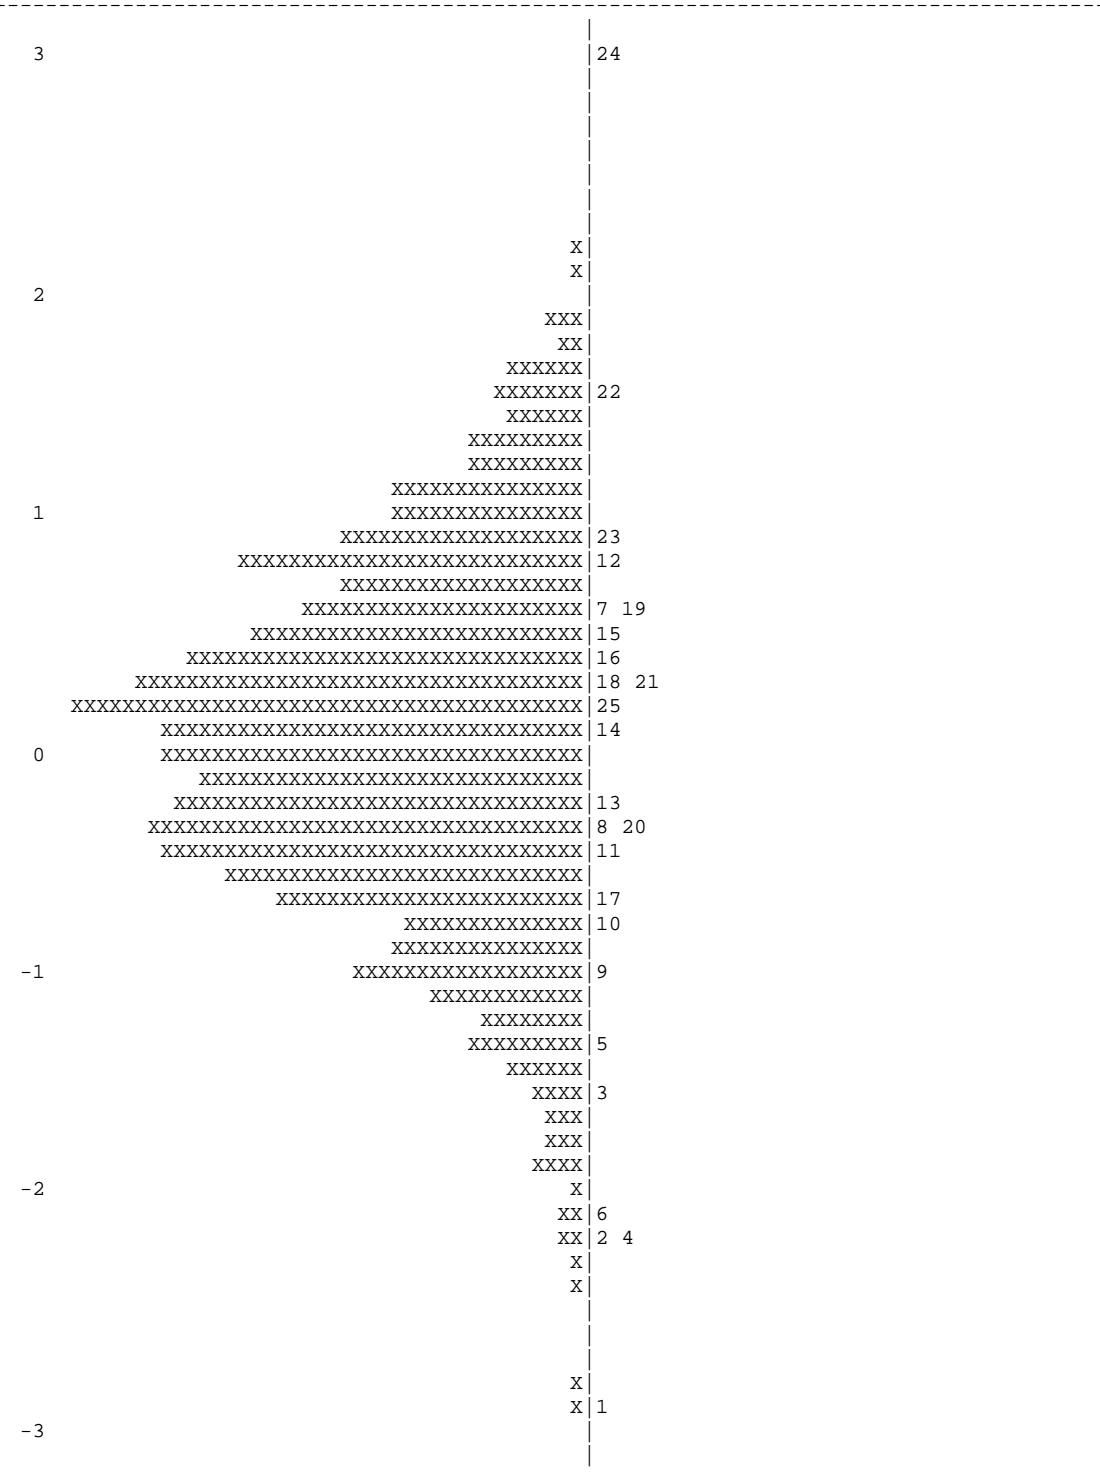

=====
Each 'X' represents 5.7 cases
=====

## E.12 Year 9 Grammar and Punctuation Variable Map

=====
NAPLAN 2017 Grammar Punctuation Year 9 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES
=====

Terms in the Model (excl Step terms)

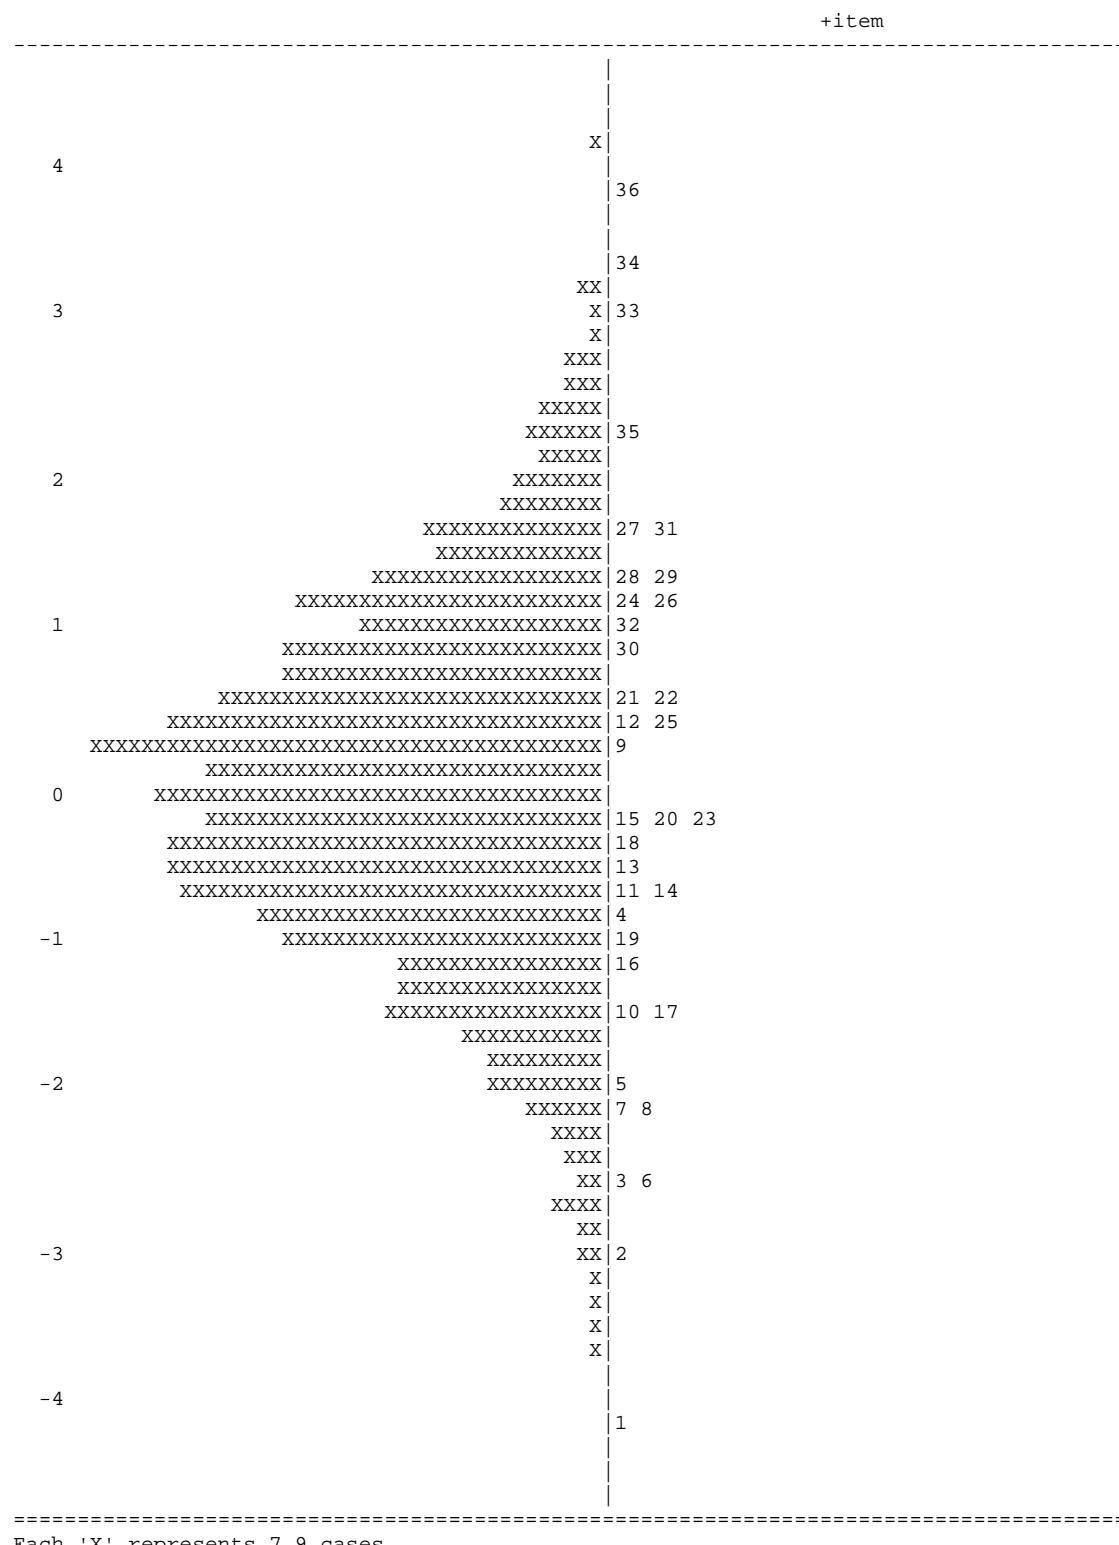

+item

=====
Each 'X' represents 5.9 cases

## E.13 Year 3 Numeracy Variable Map

=====
NAPLAN 2017 Numeracy Year 3 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES  
=====
Terms in the Model (excl Step terms)

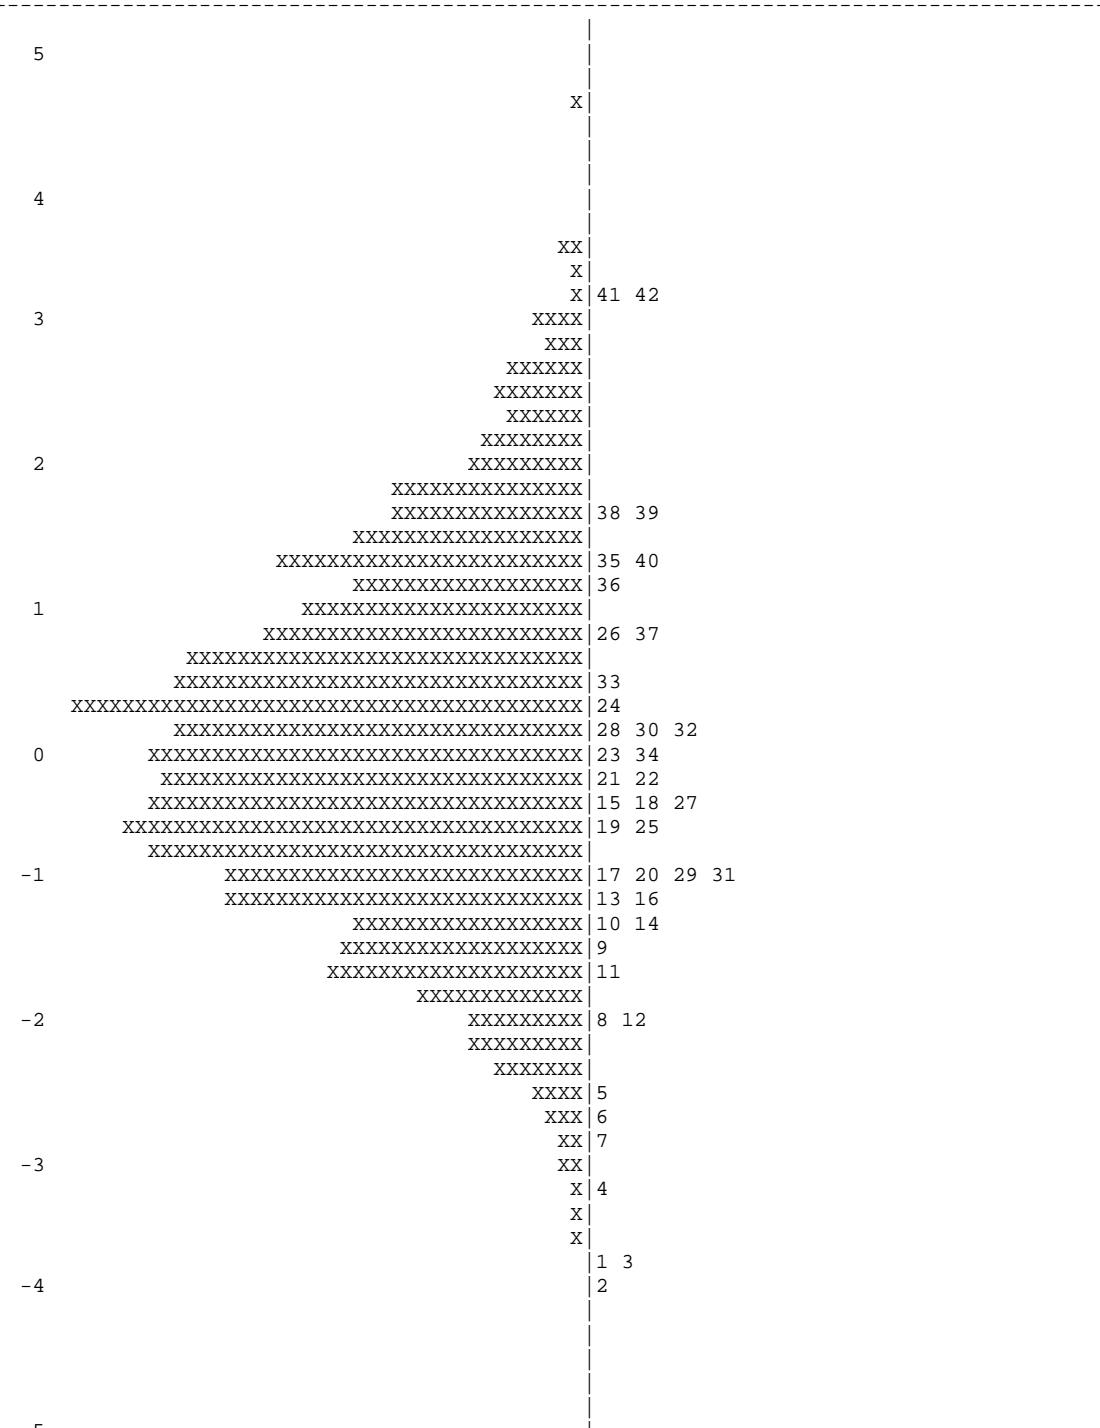

=====  
Each 'X' represents 7.9 cases

## E.14 Year 5 Numeracy Variable Map

=====
NAPLAN 2017 Numeracy Year 5 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES  
=====

Terms in the Model (excl Step terms)

+item

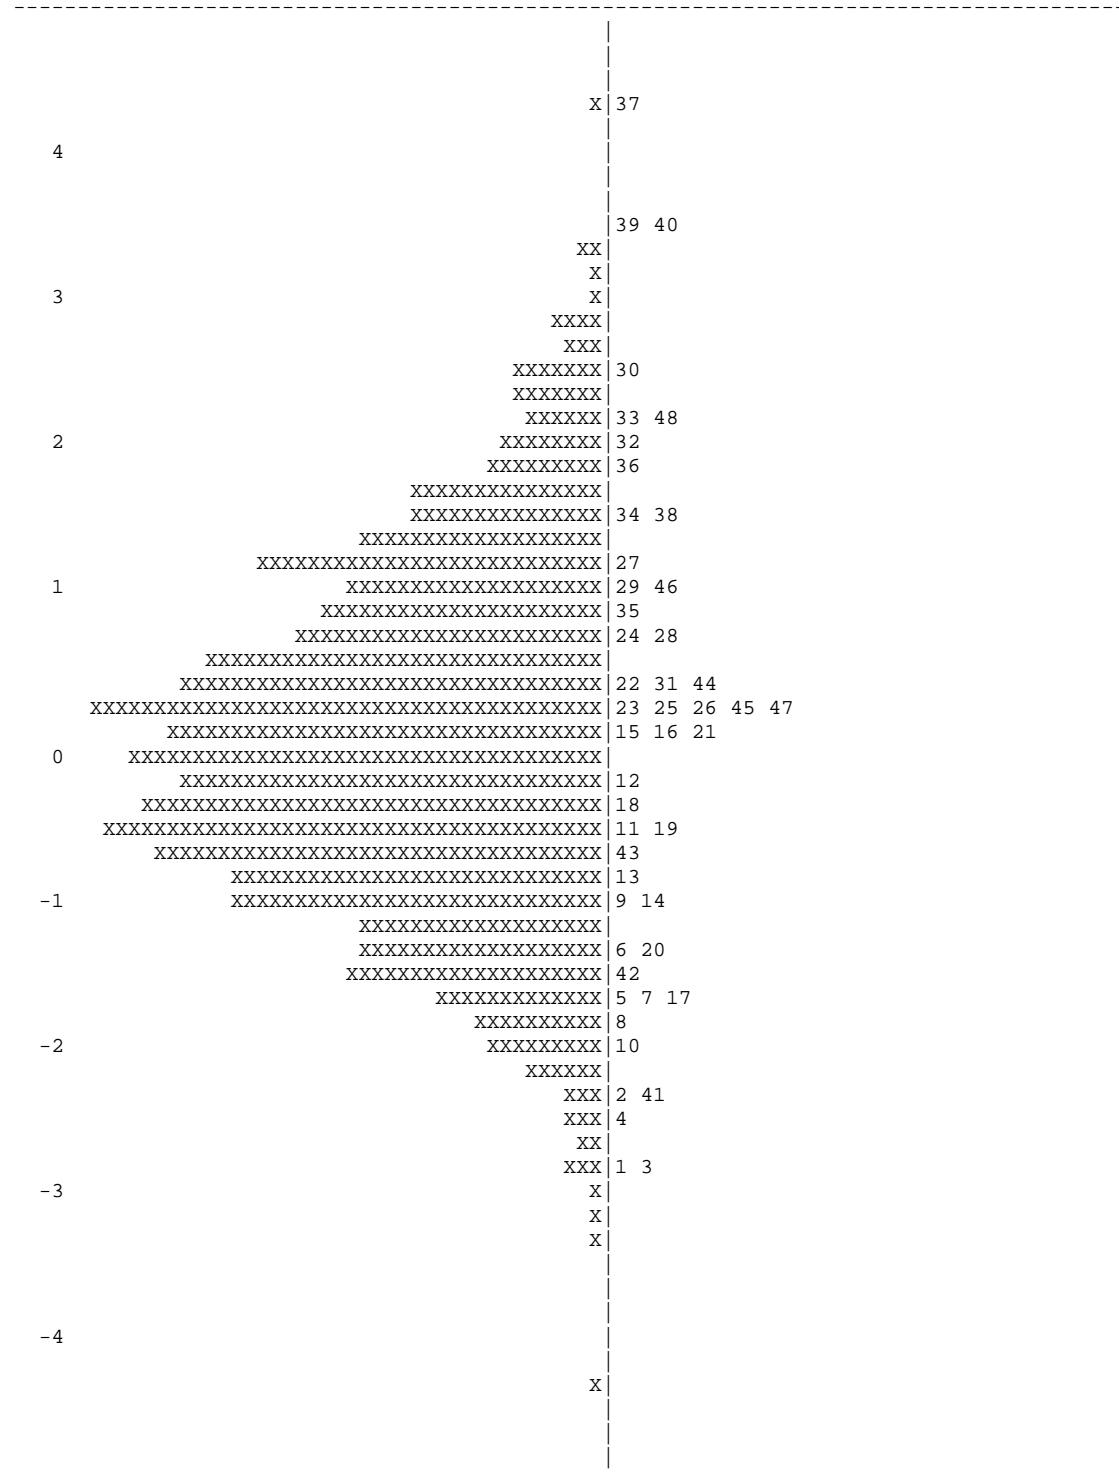

=====  
Each 'X' represents 7.8 cases

## E.15 Year 7 Numeracy Variable Map

=====
NAPLAN 2017 Numeracy Year 7 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES  
=====

Terms in the Model (excl Step terms)

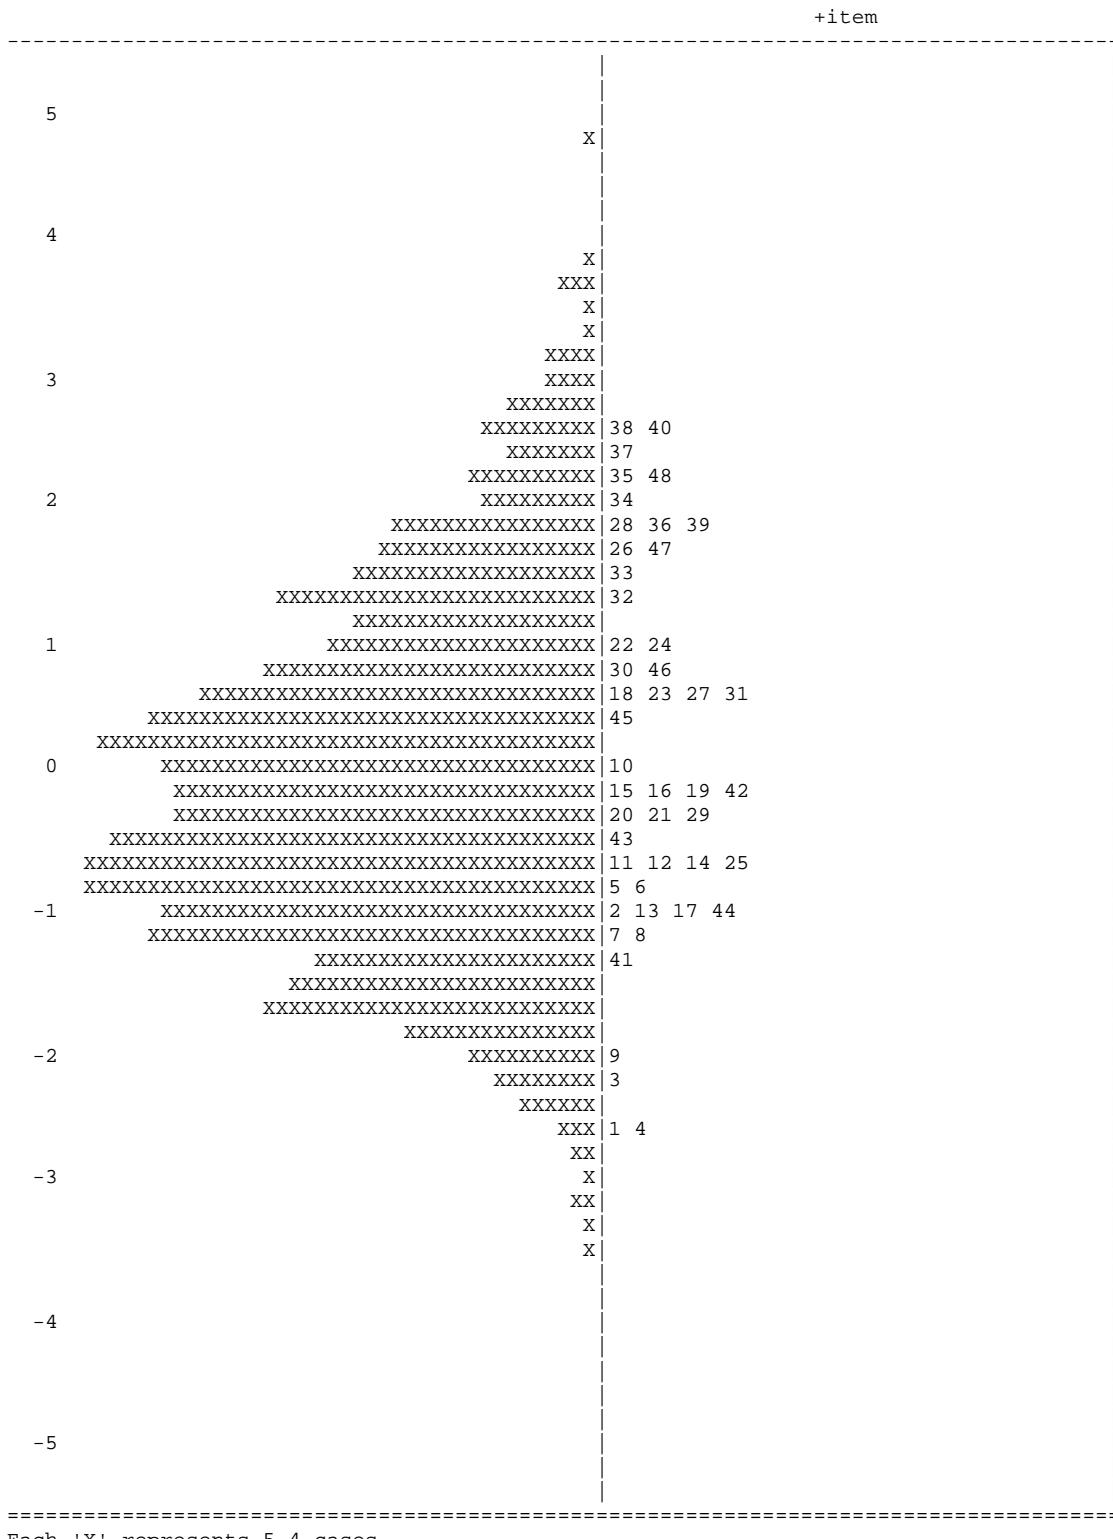

+item

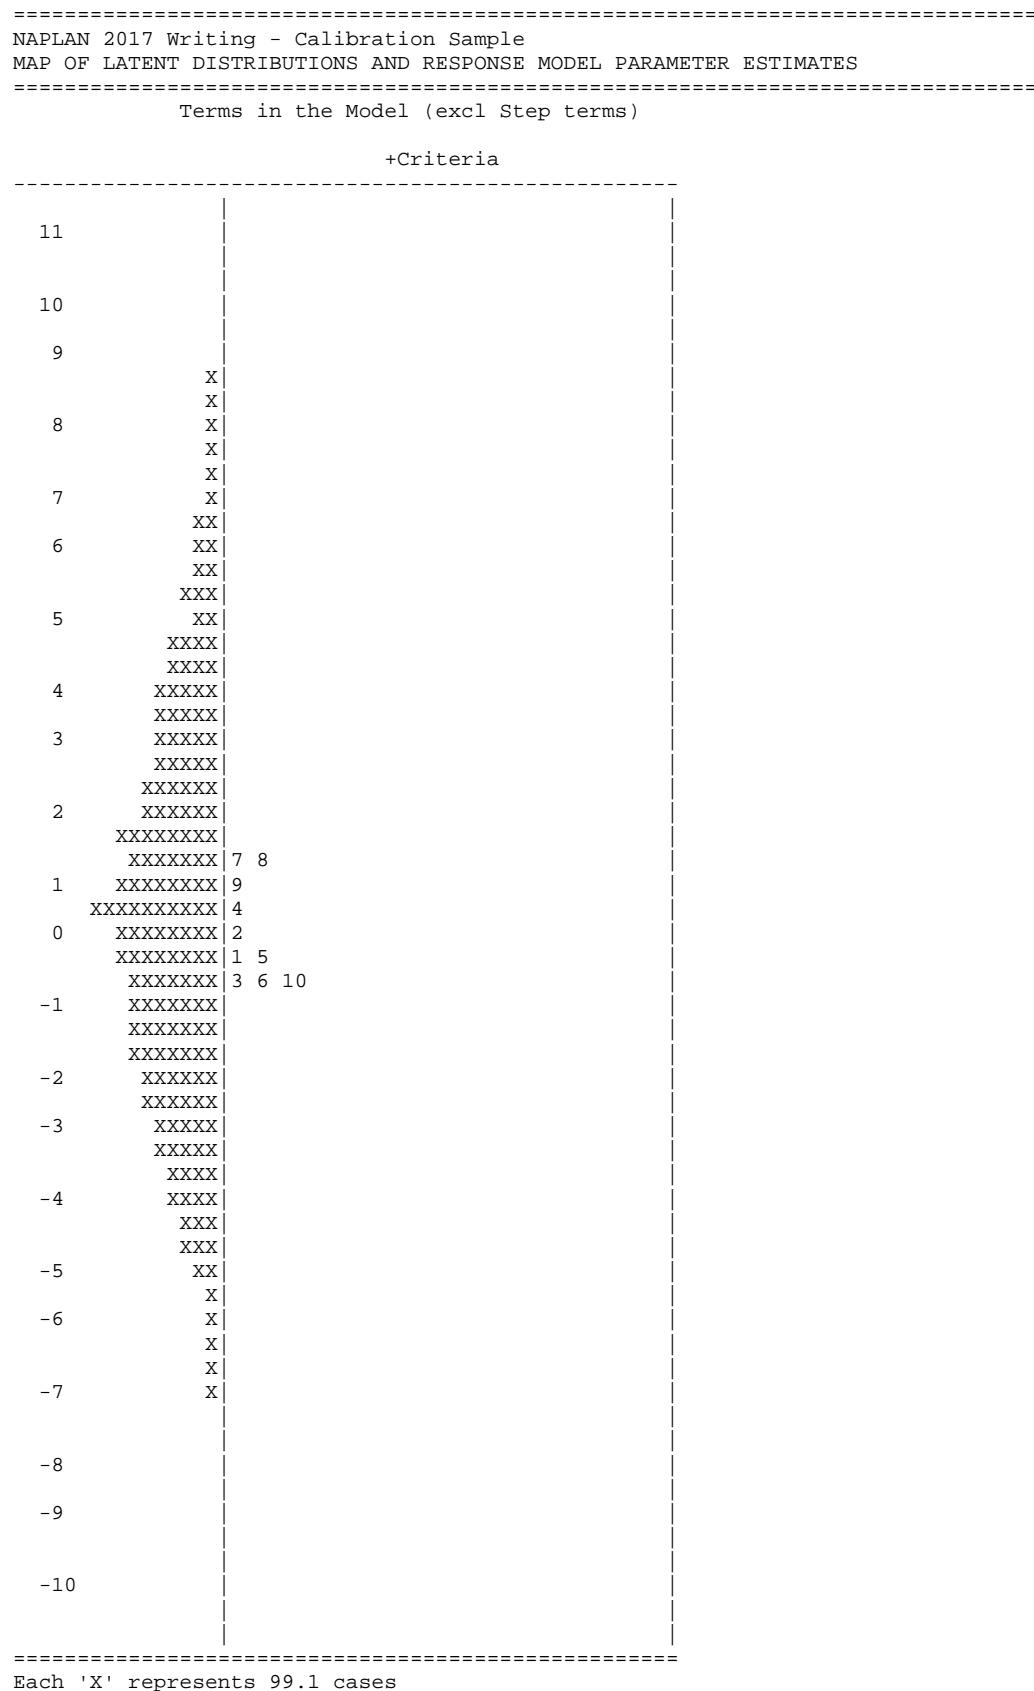

=====
Each 'X' represents 5.7 cases

## E.16 Year 9 Numeracy Variable Map

=====
NAPLAN 2017 Numeracy Year 9 - Calibration Sample  
MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES  
=====
Terms in the Model (excl Step terms)

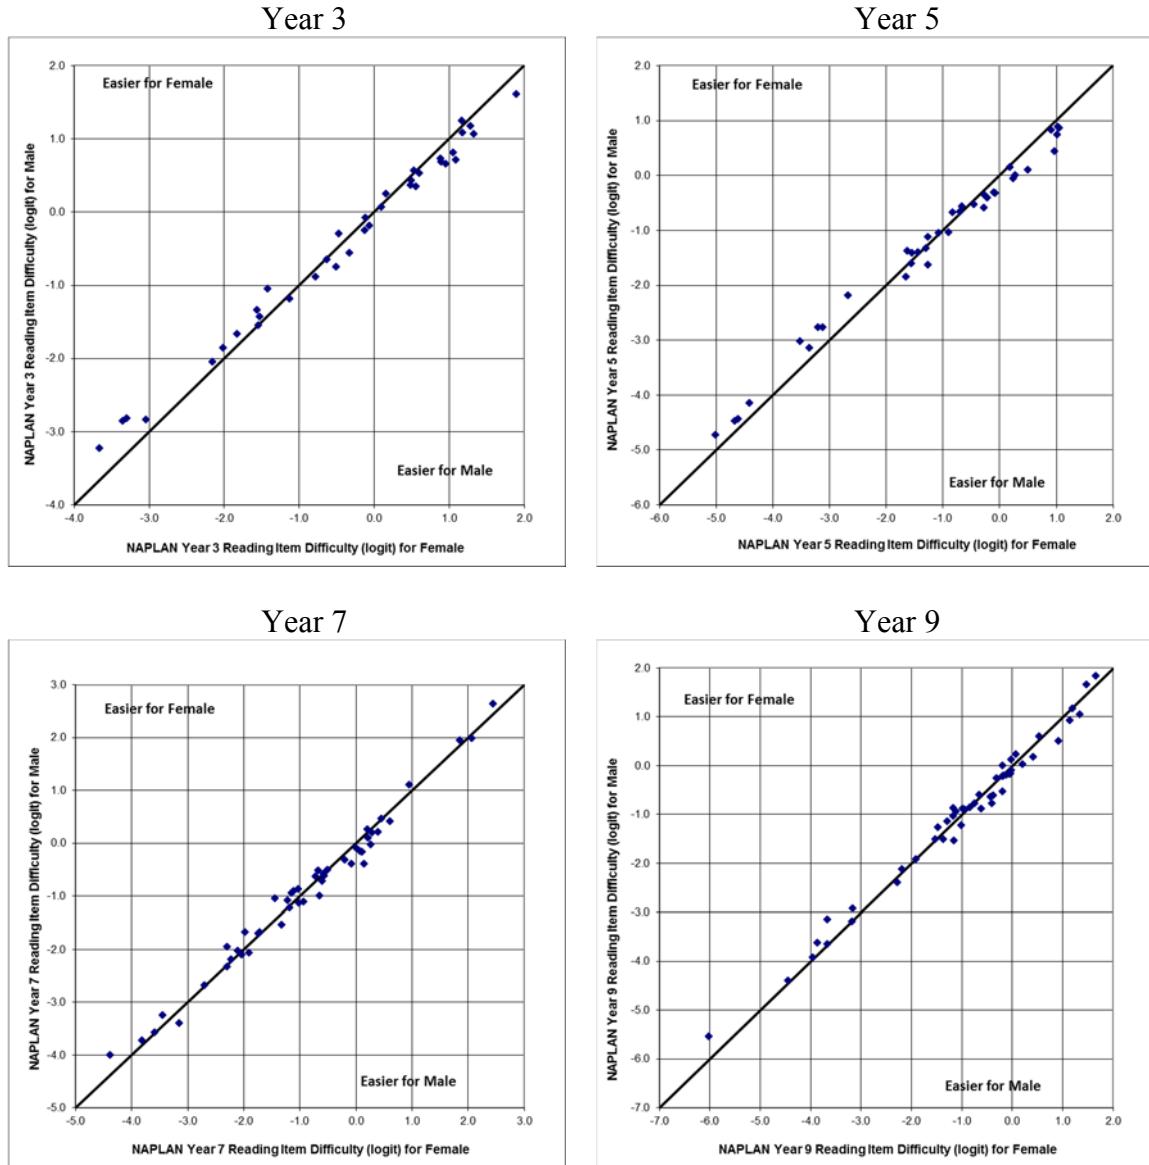

## E.17 Year 3, 5, 7, 9 Writing Variable Map

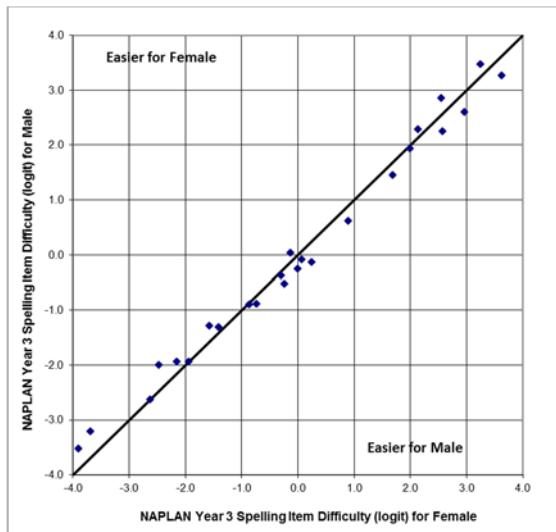

## APPENDIX F. GENDER DIF ANALYSIS

### F.1 Comparison of Male and Female Students in Reading (2017)

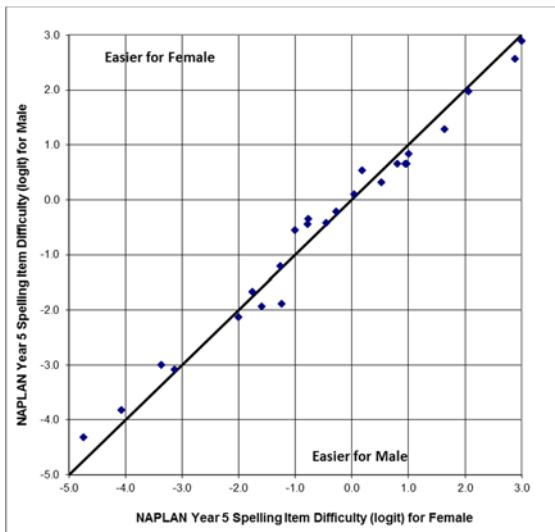

## F.2 Comparison of Male and Female Students in Spelling (2017)

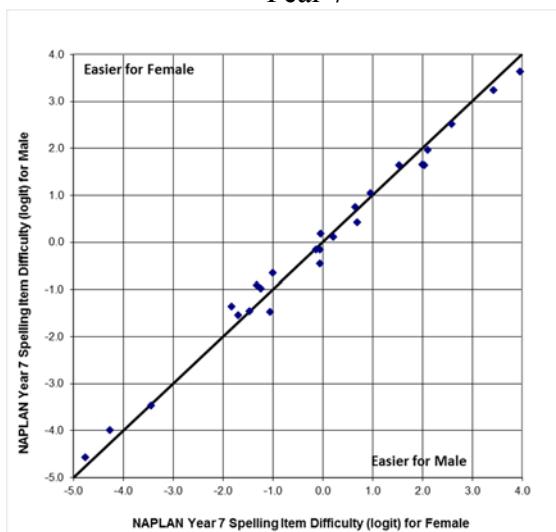

Year 3

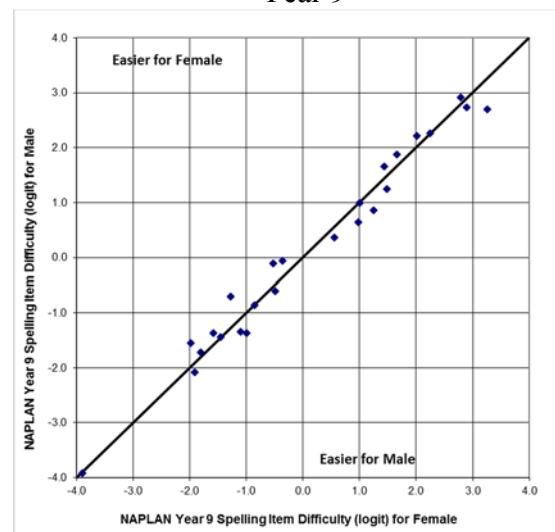

Year 5

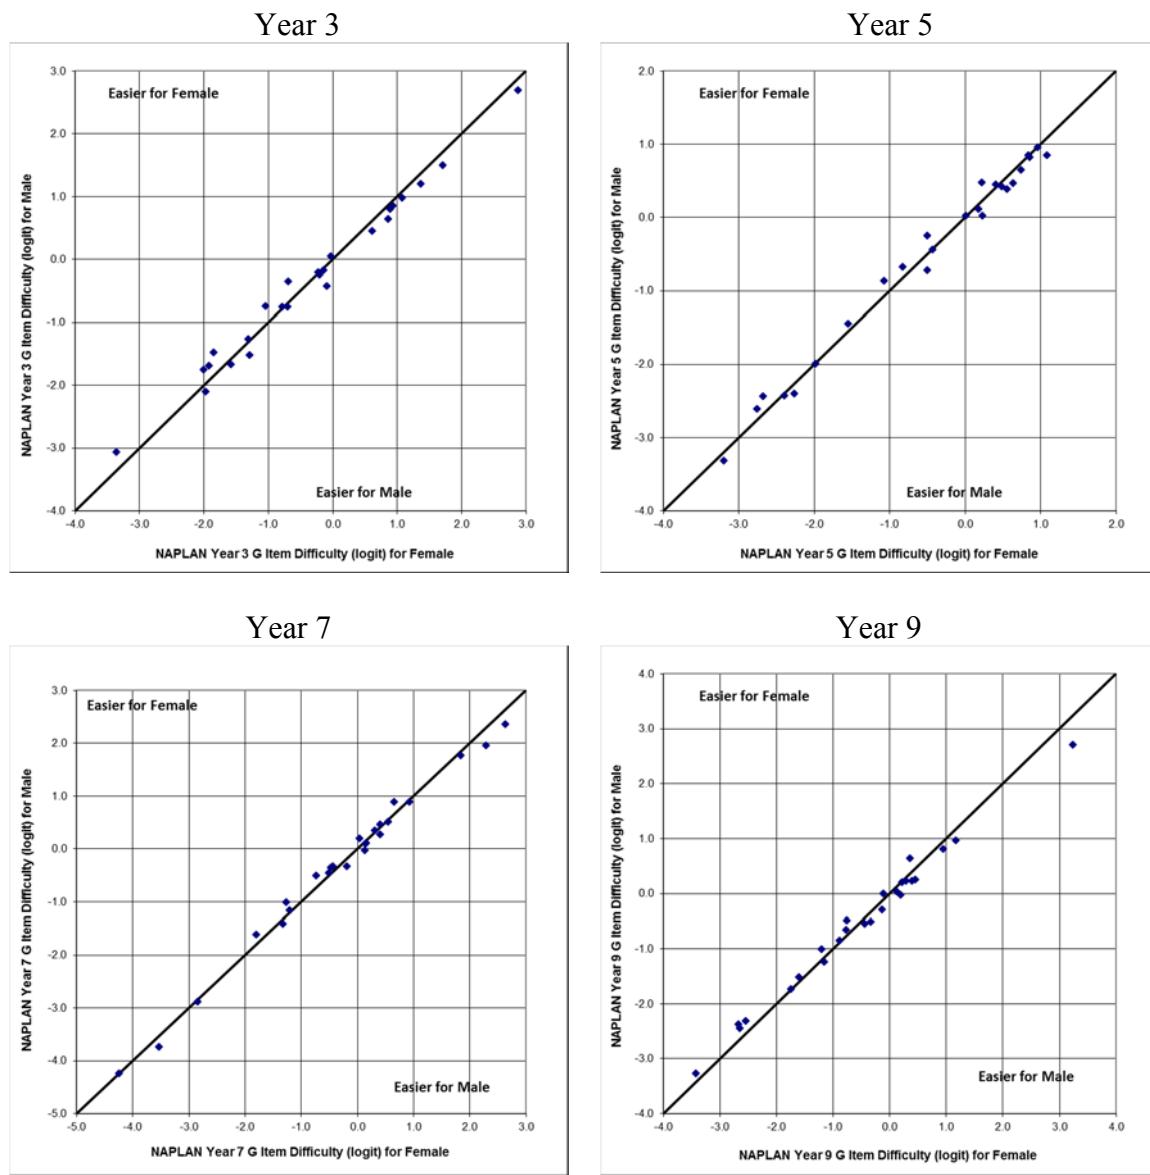

Year 7

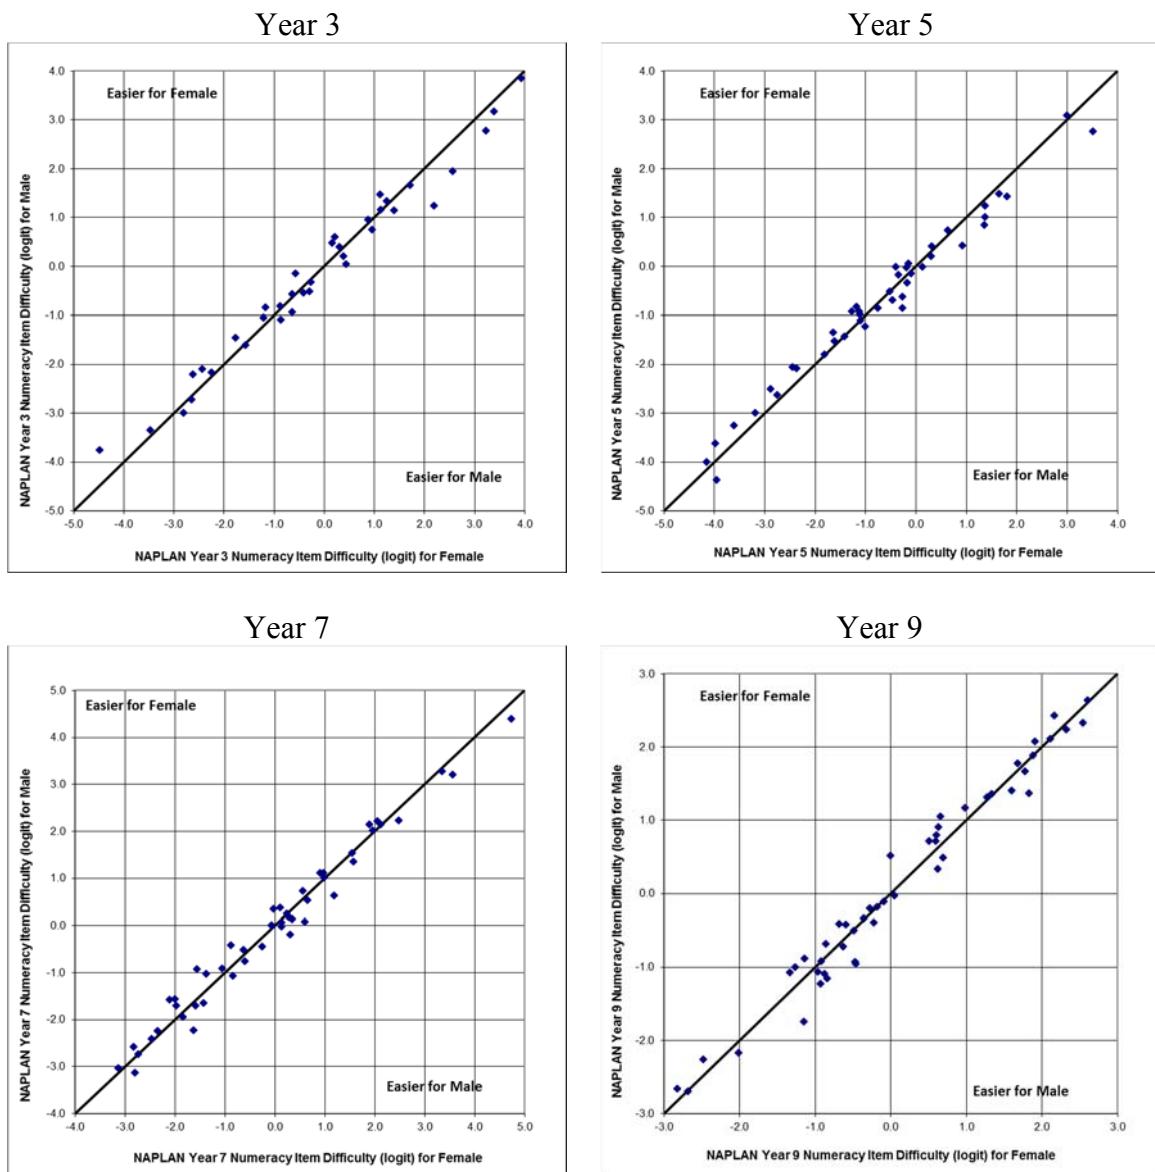

Year 9

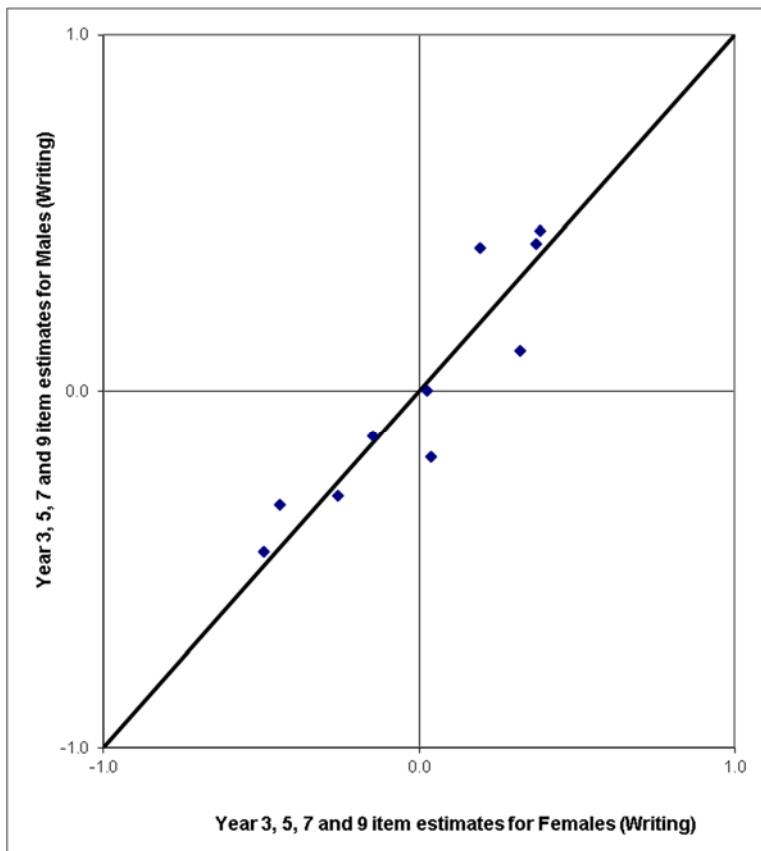

### F.3 Comparison of Male and Female Students in Grammar and Punctuation (2017)

#### F.4 Comparison of Male and Female Students in Numeracy (2017)

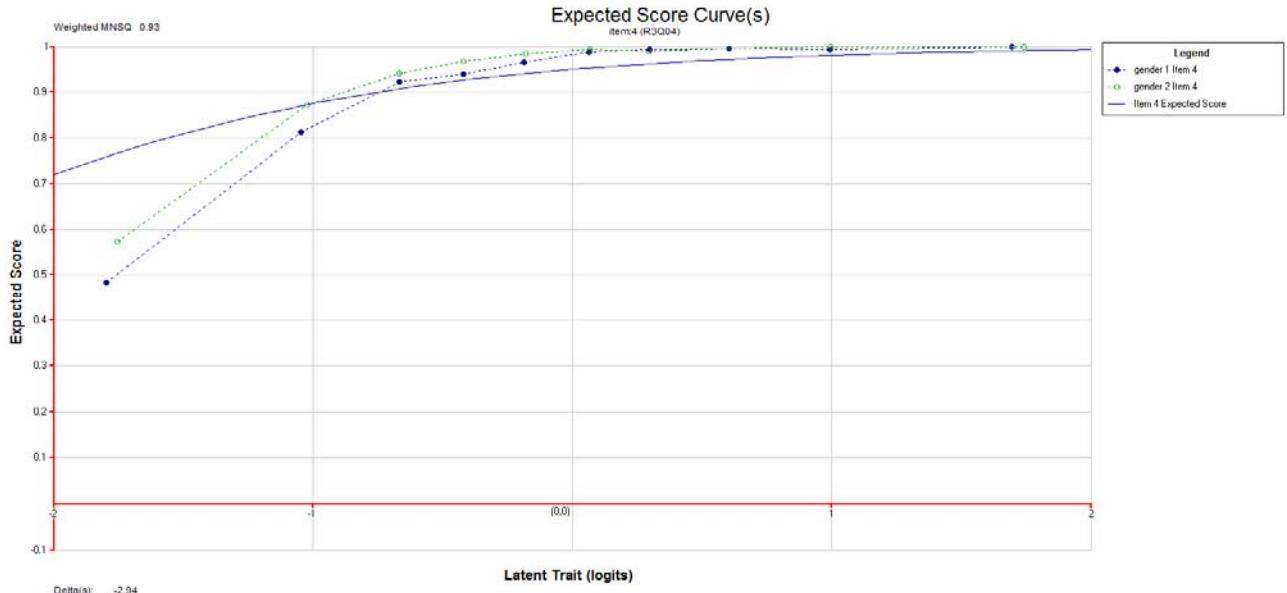

### F.5 Comparison of Male and Female Students in Writing (2017)

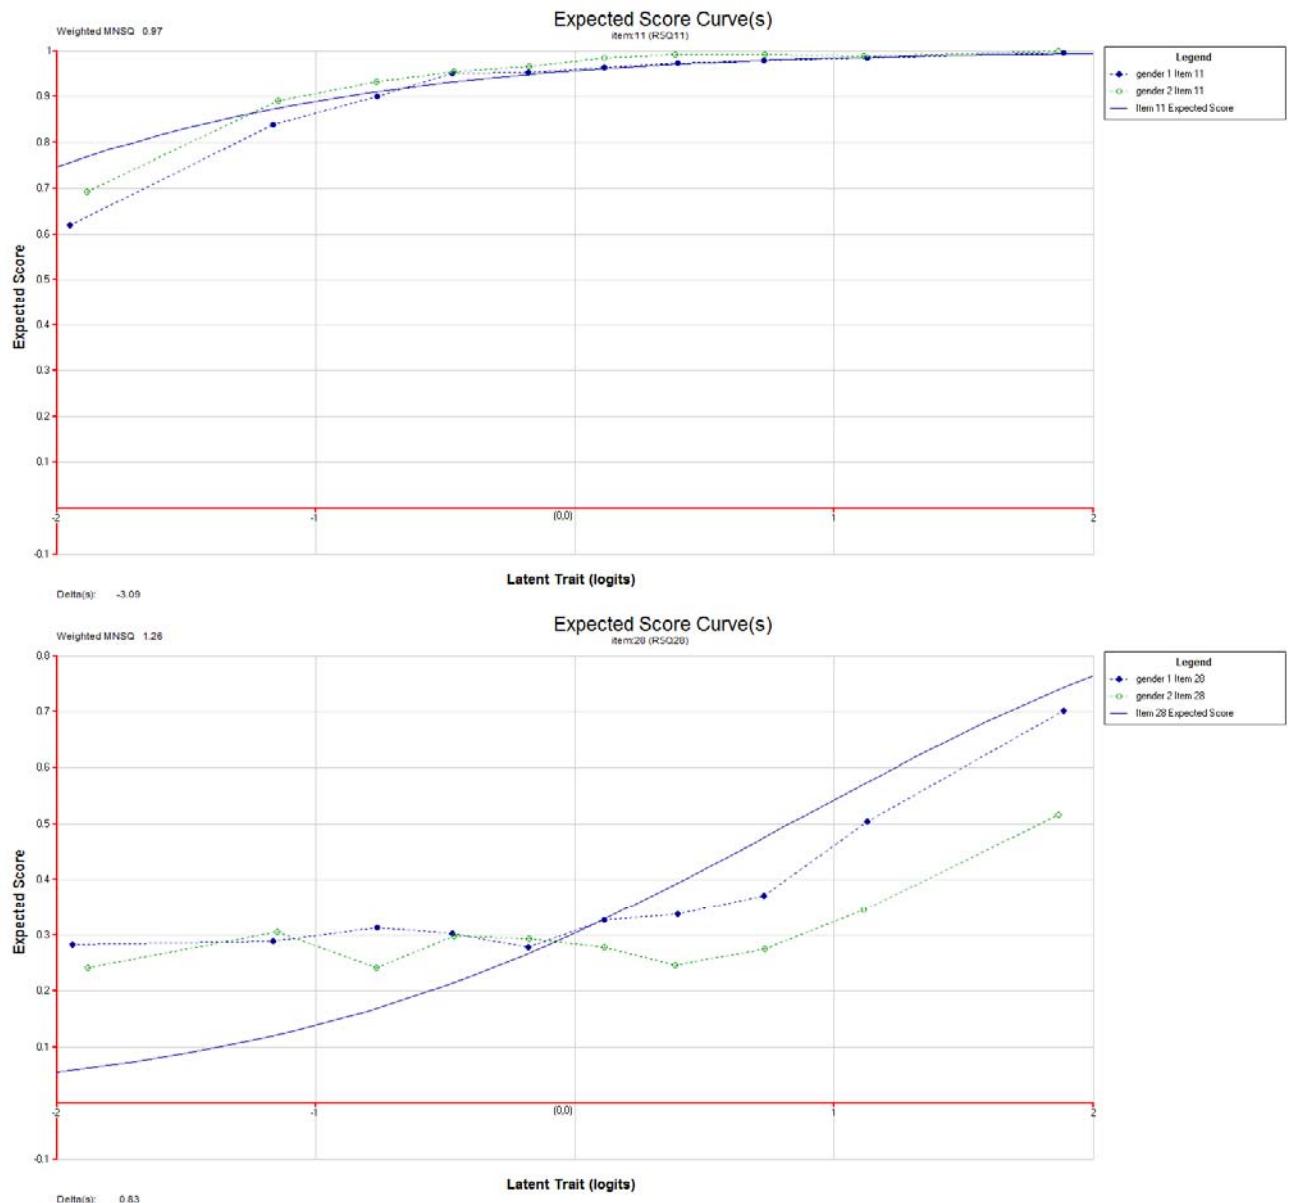

## F.6 Item DIF Plots for Items Showing Gender DIF<sup>1</sup>

### F.6.1. Year 3 Reading

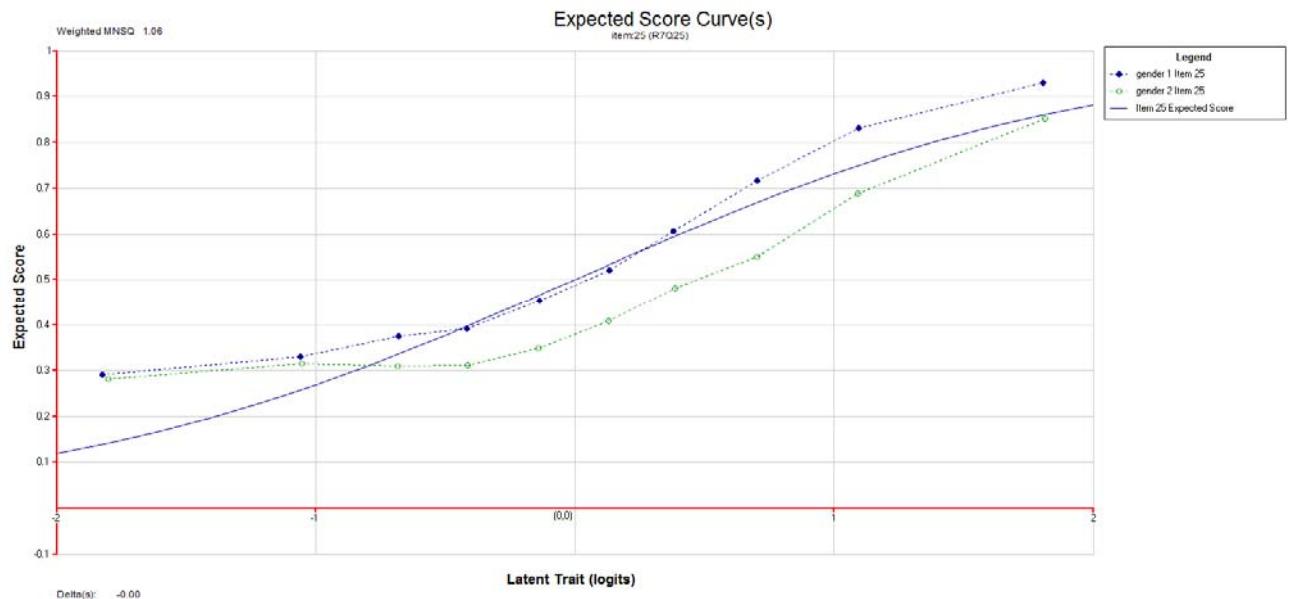

<sup>1</sup> 'gender 1' indicates 'Male' and 'gender 2' indicates 'Female'.

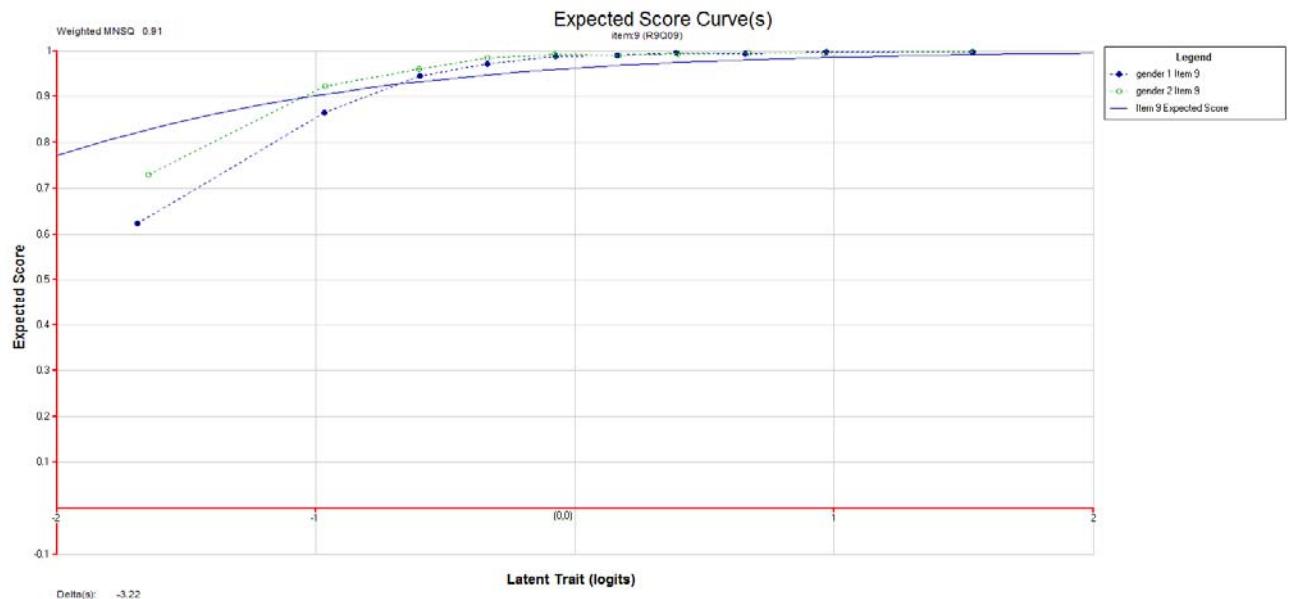

### F.6.2. Year 5 Reading

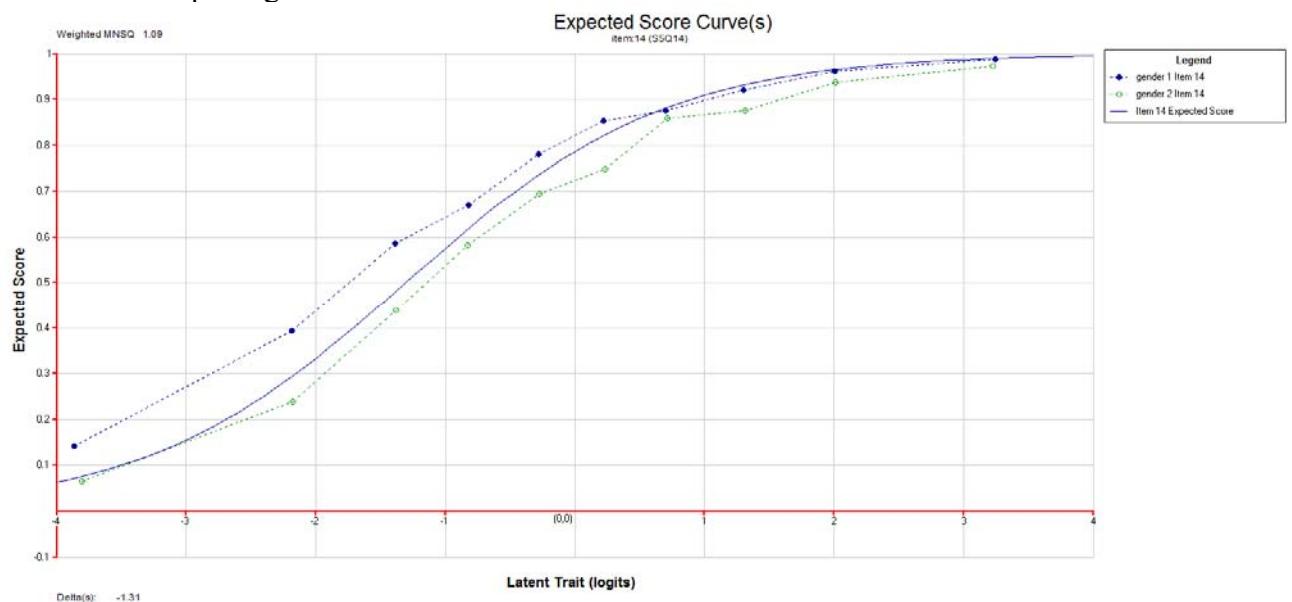

### F.6.3. Year 7 Reading

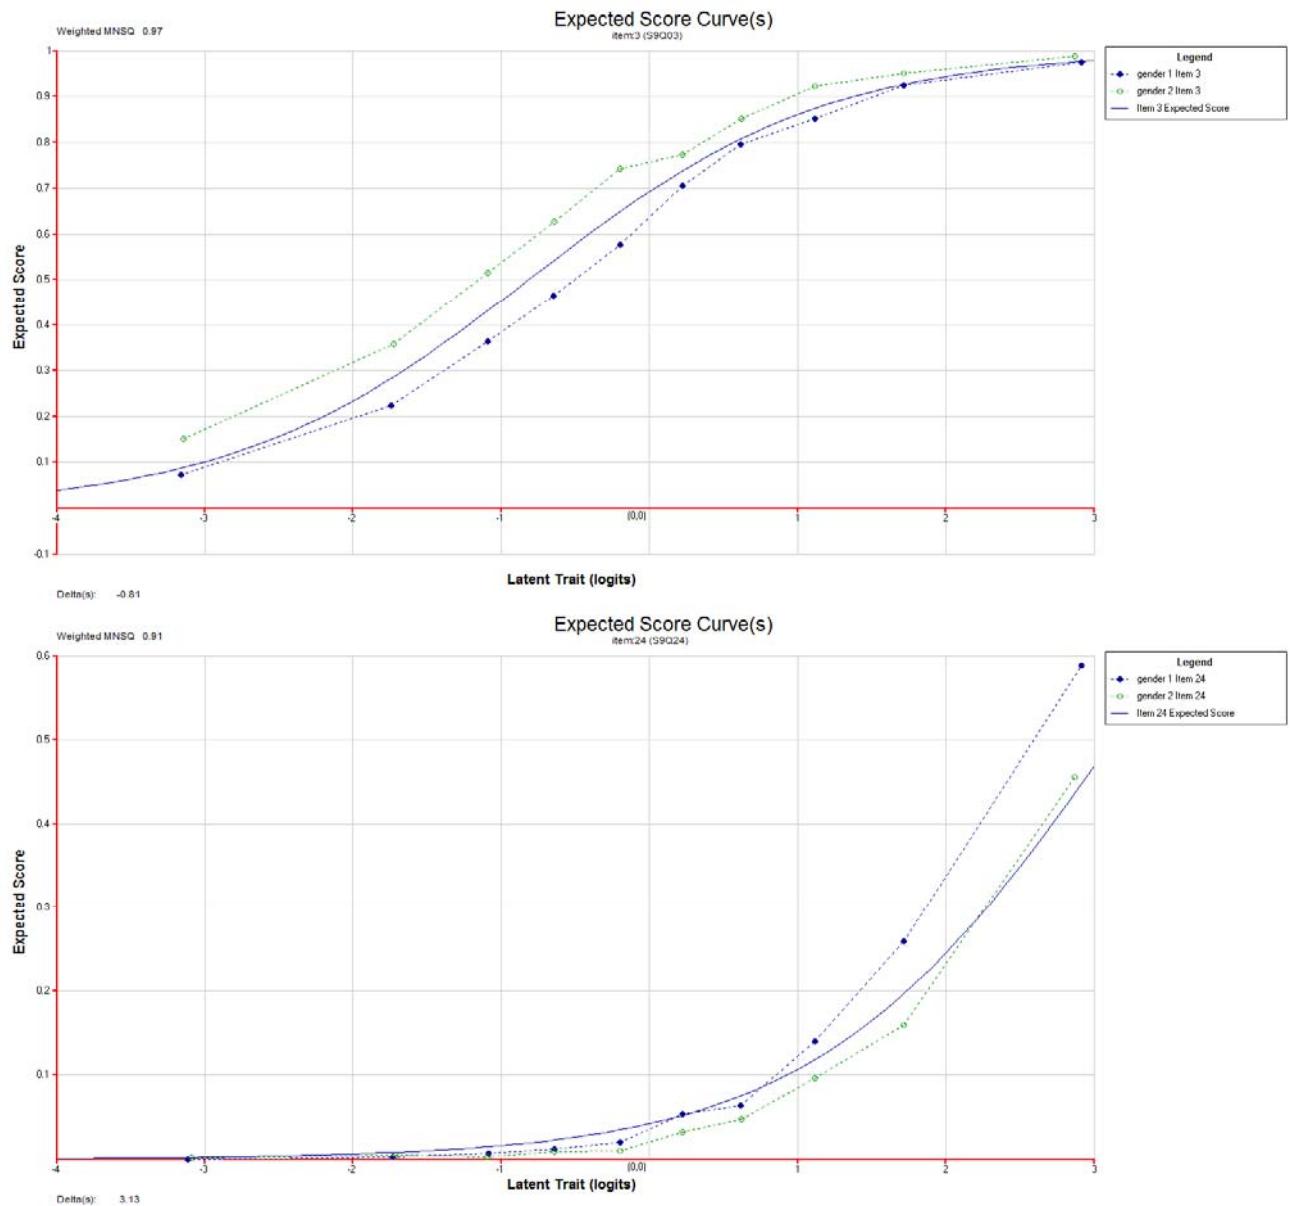

#### F.6.4. Year 9 Reading

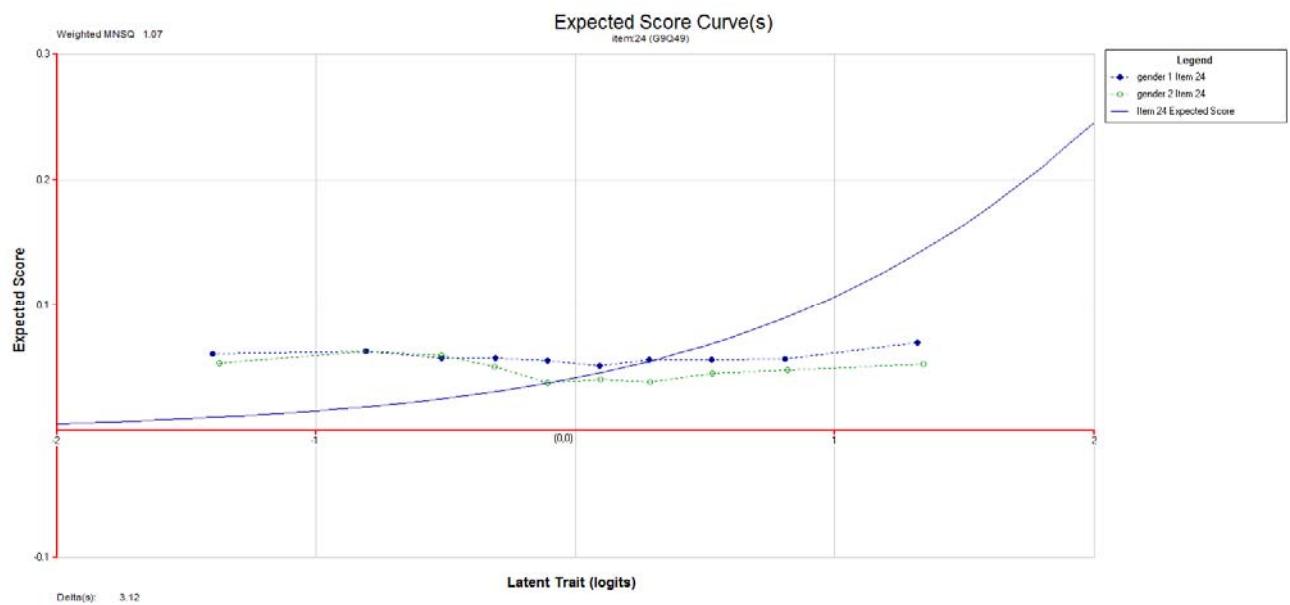

### F.6.5. Year 5 Spelling

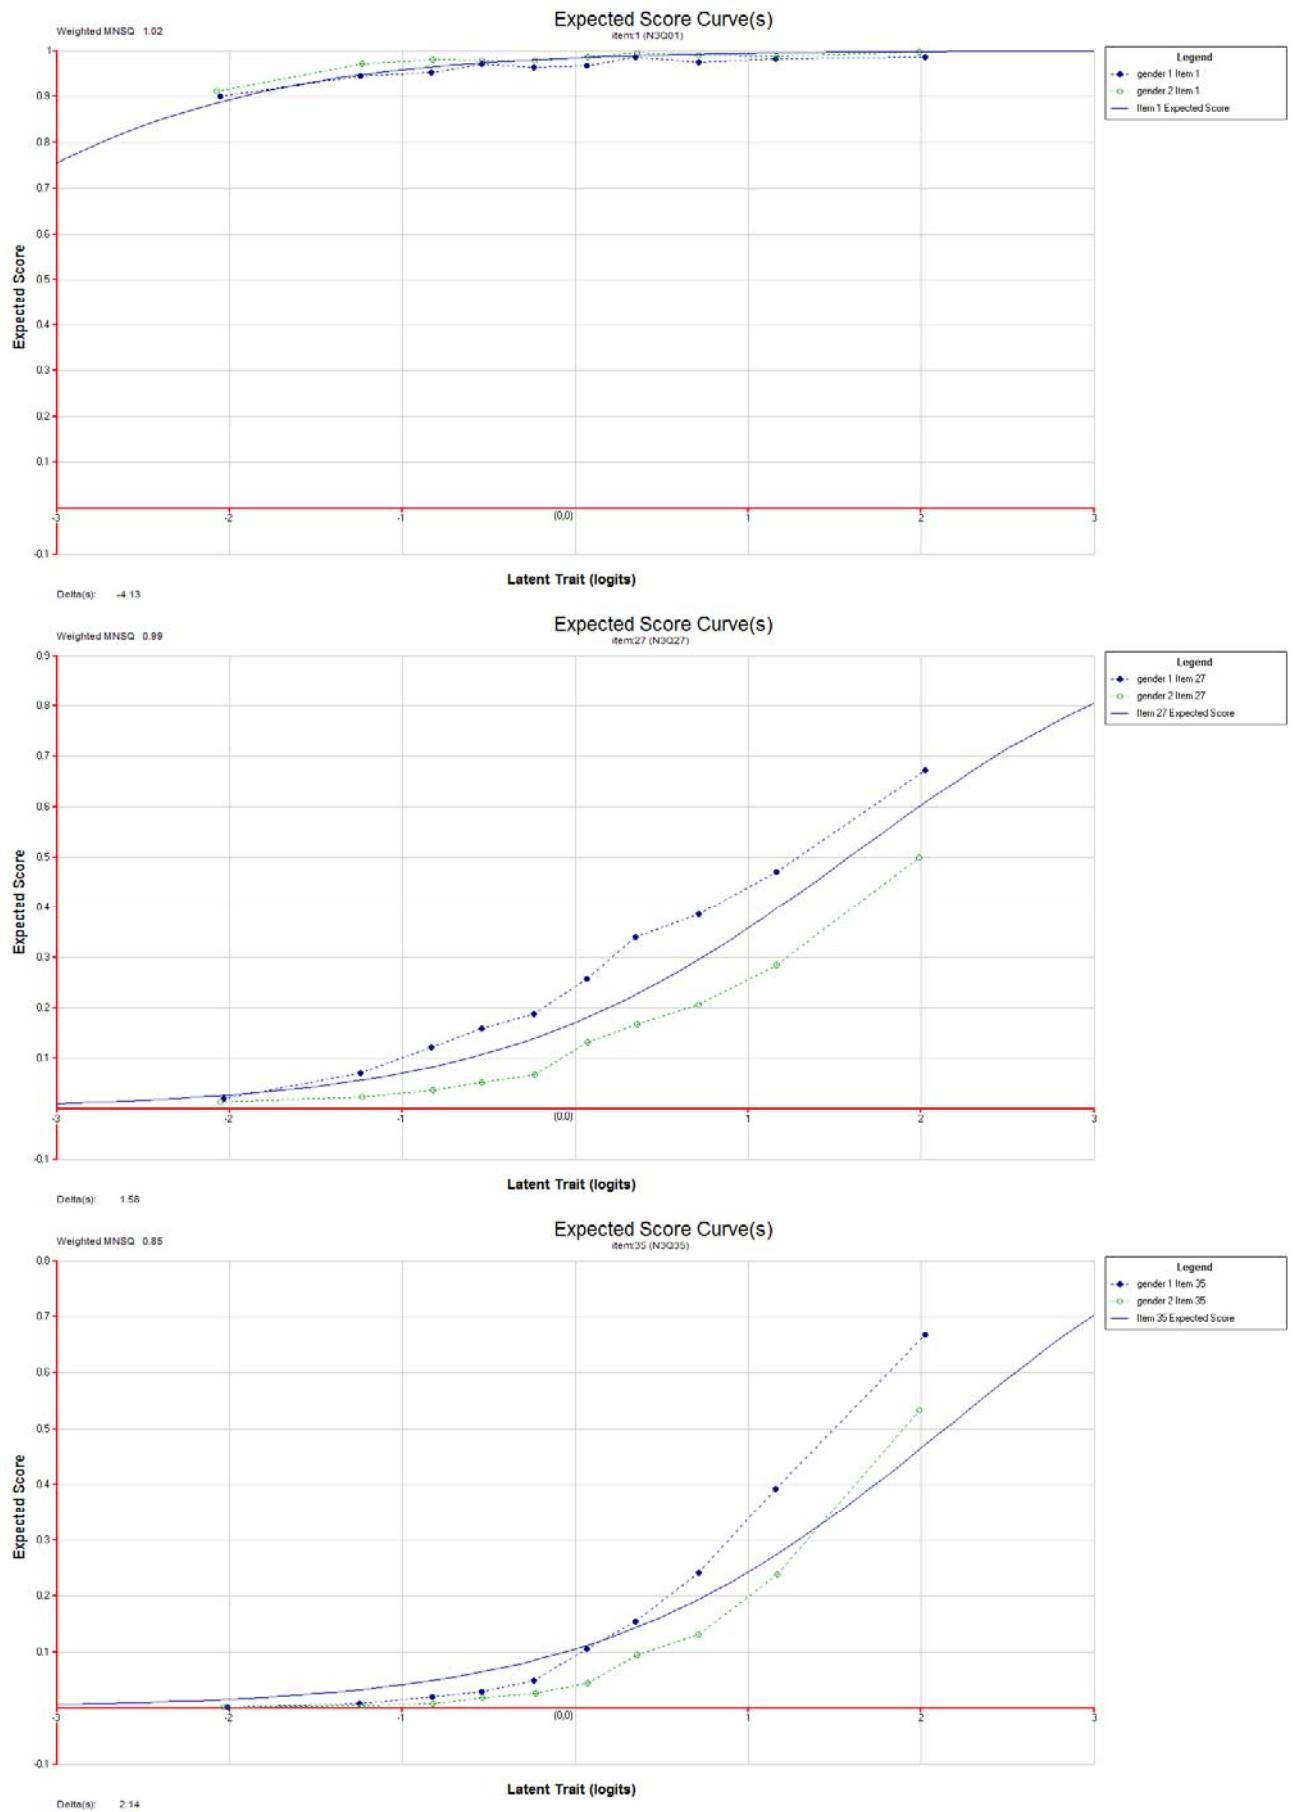

### F.6.6. Year 9 Spelling

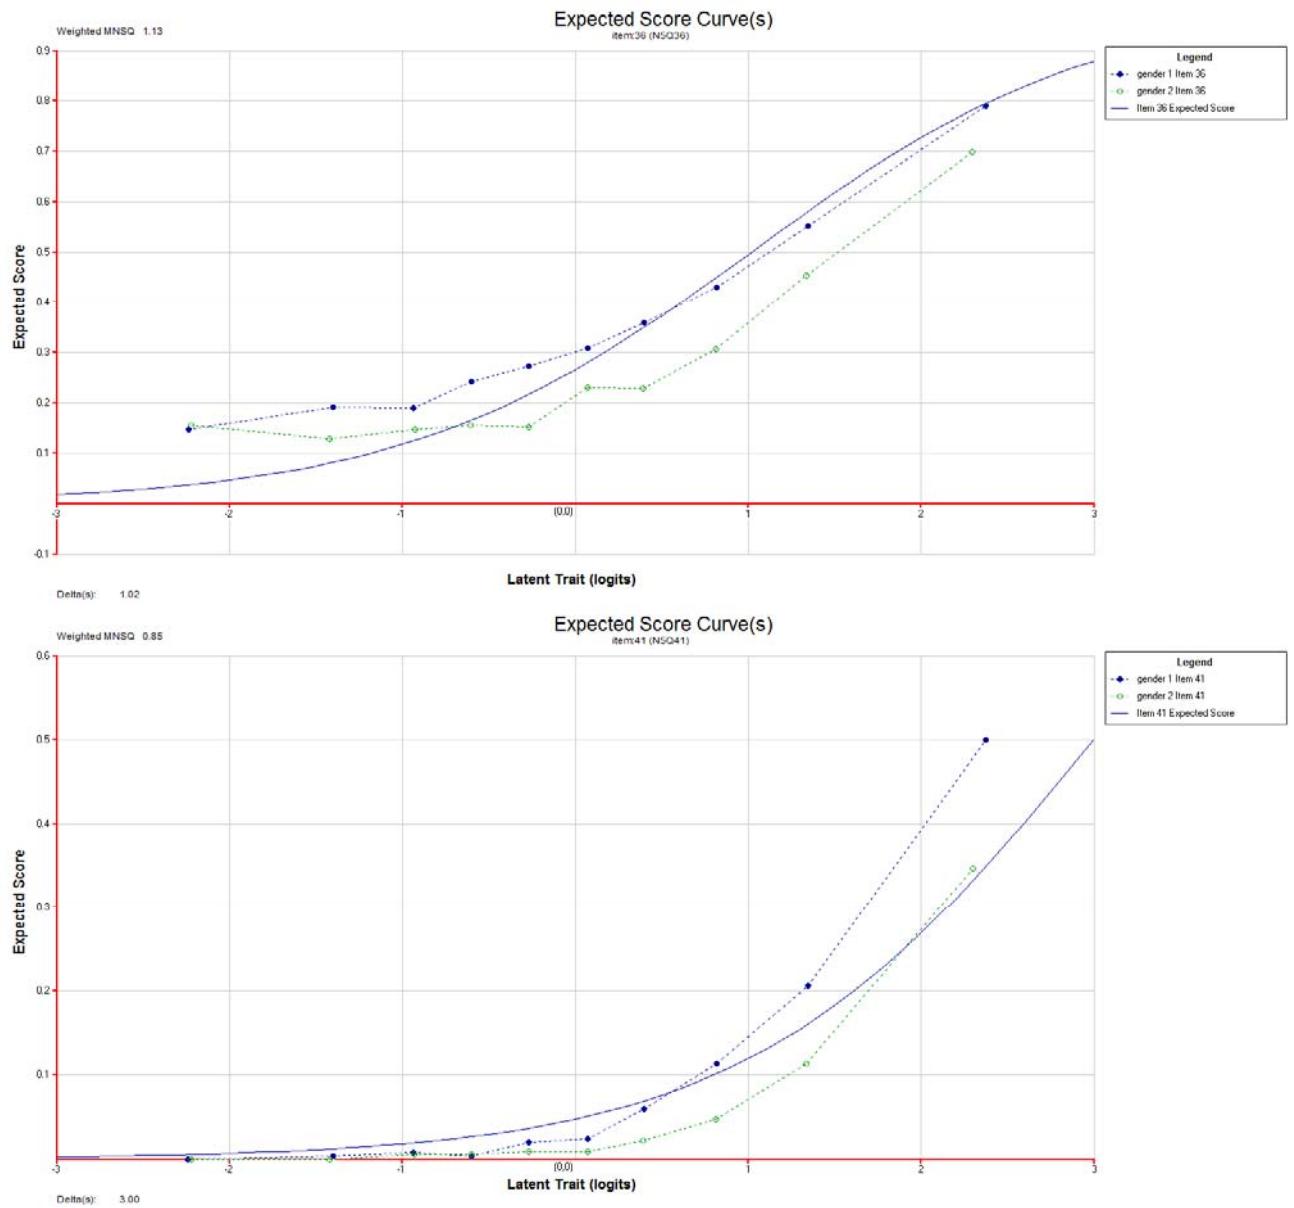

### F.6.7. Year 9 Grammar and Punctuation

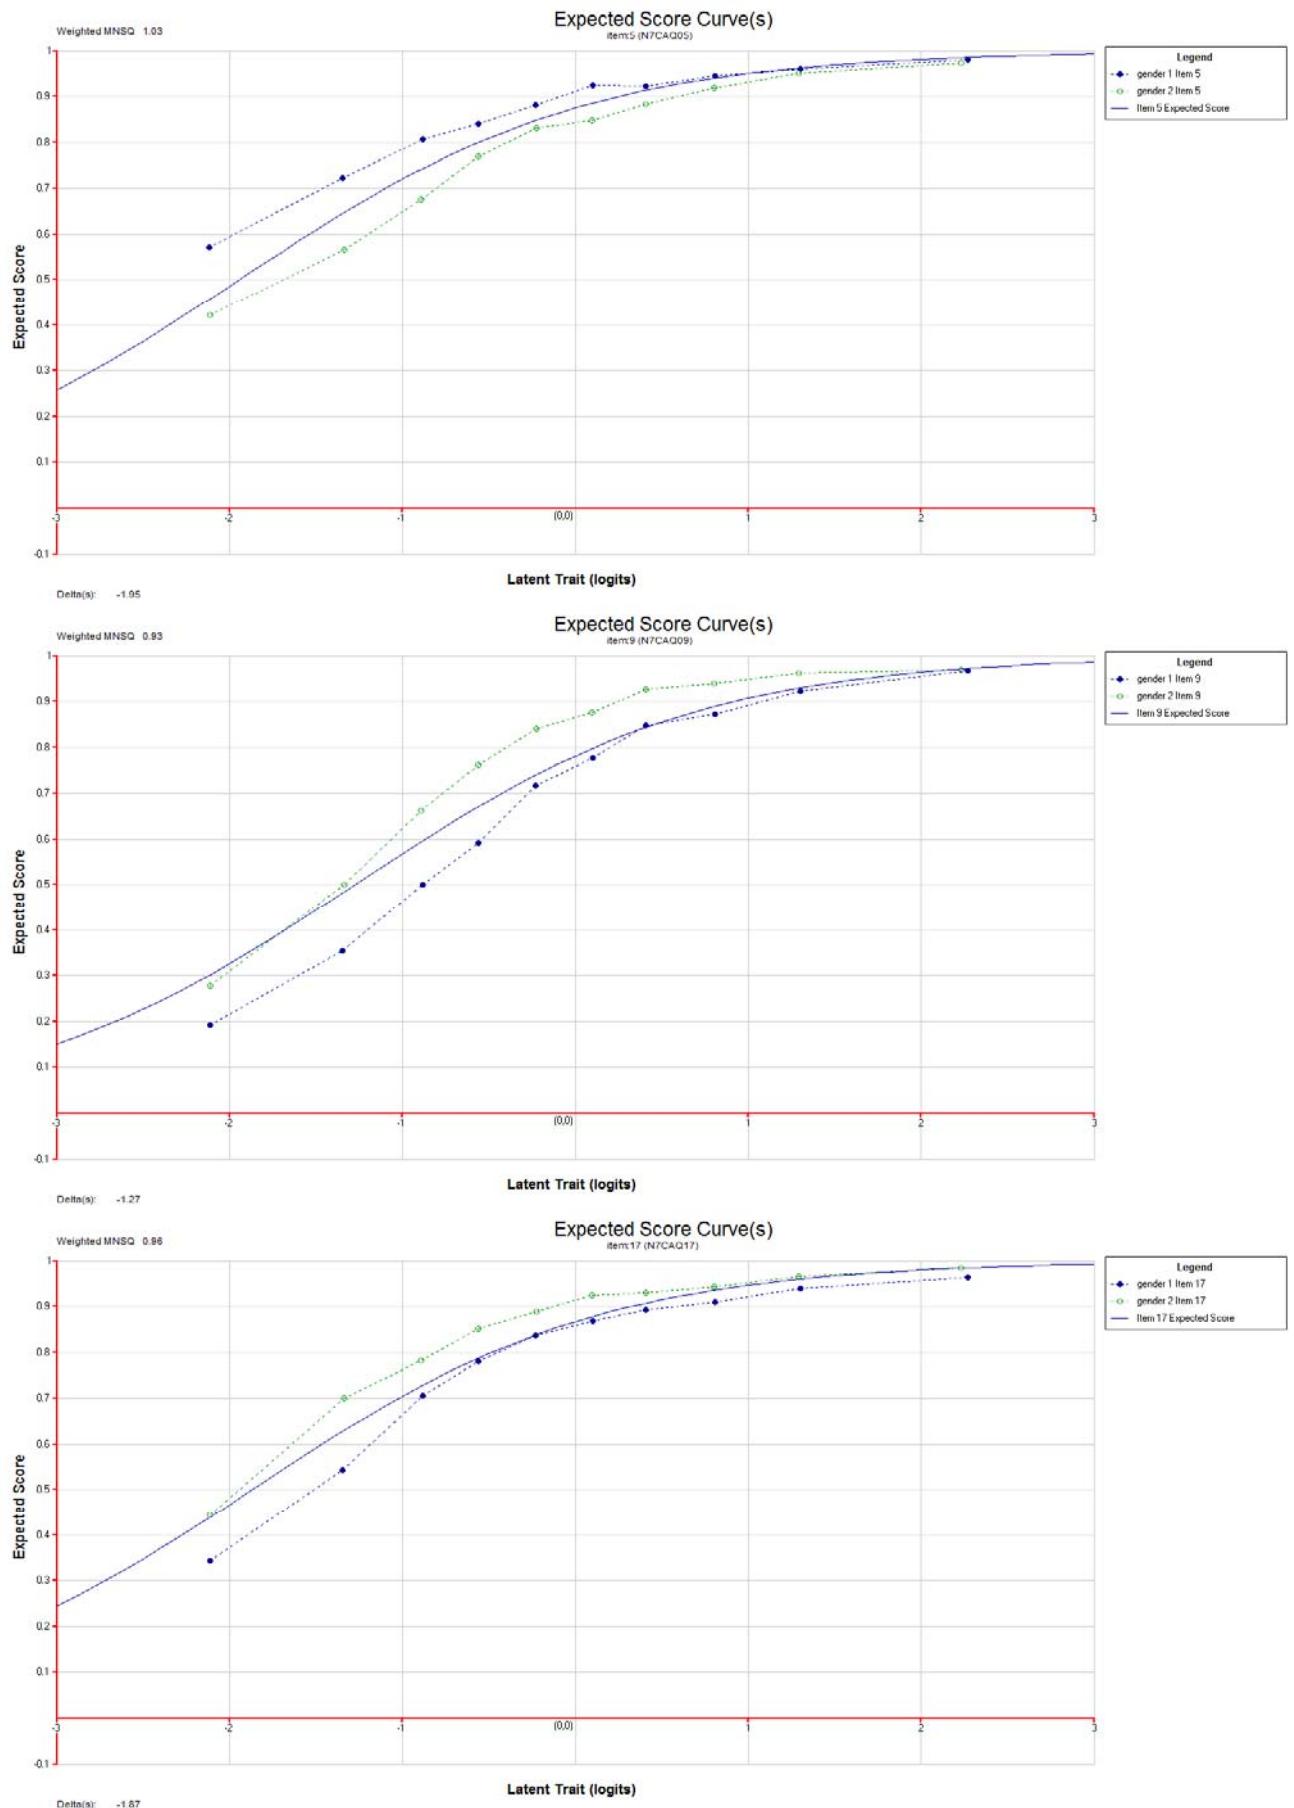

### F.6.8. Year 3 Numeracy

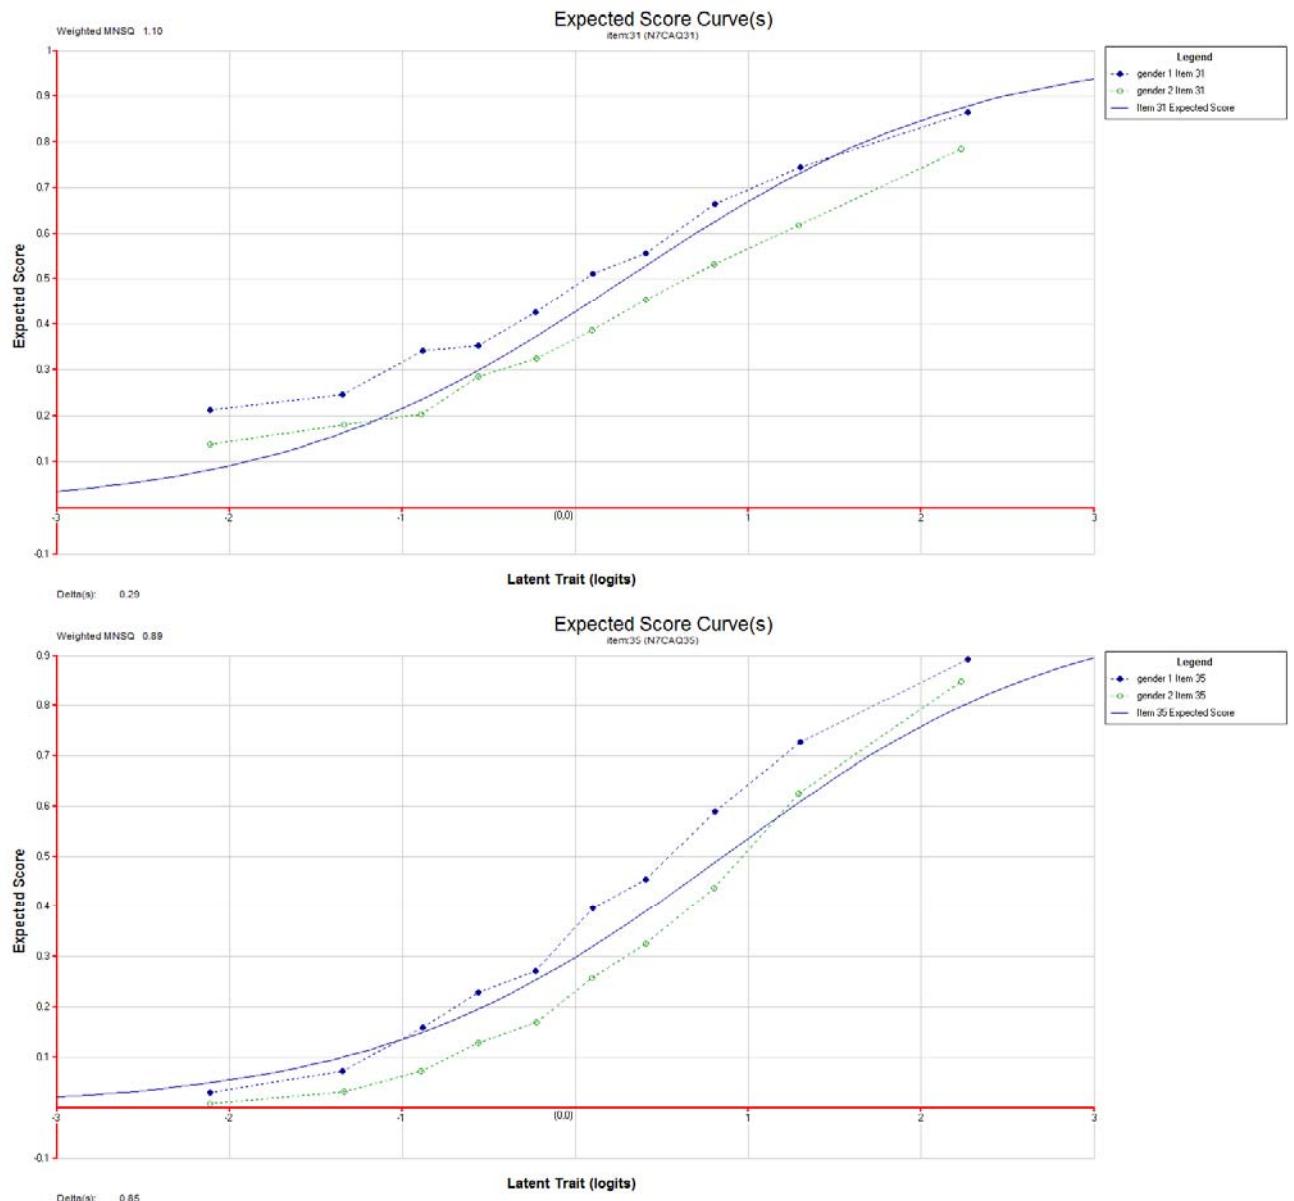

### F.6.9. Year 5 Numeracy

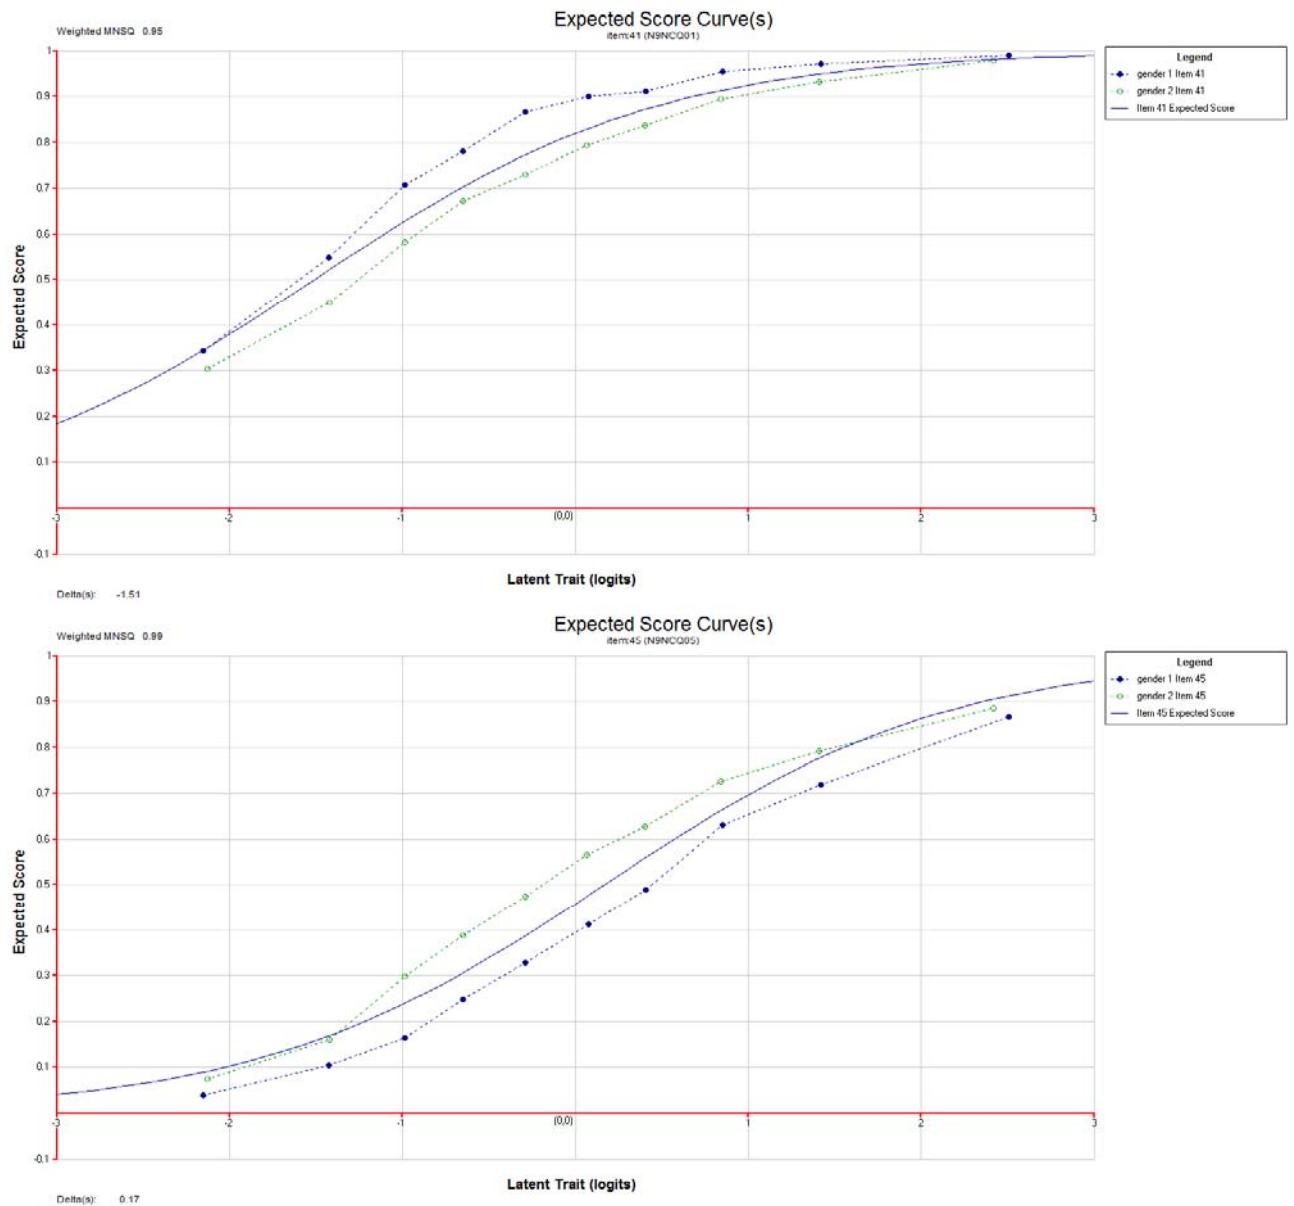

### F.6.10. Year 7 Numeracy

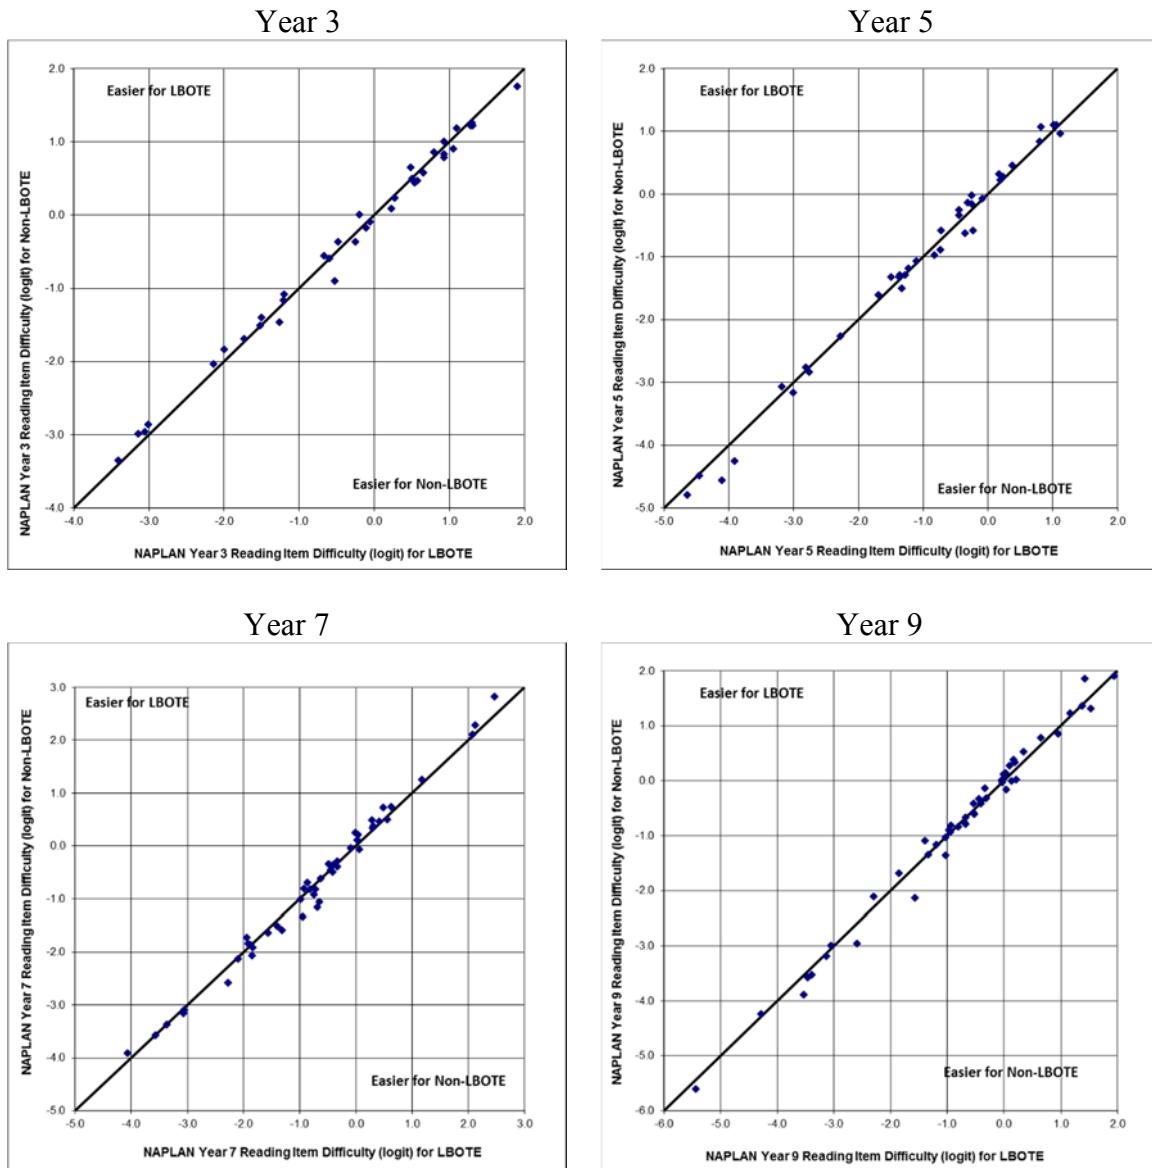

### F.6.11. Year 9 Numeracy

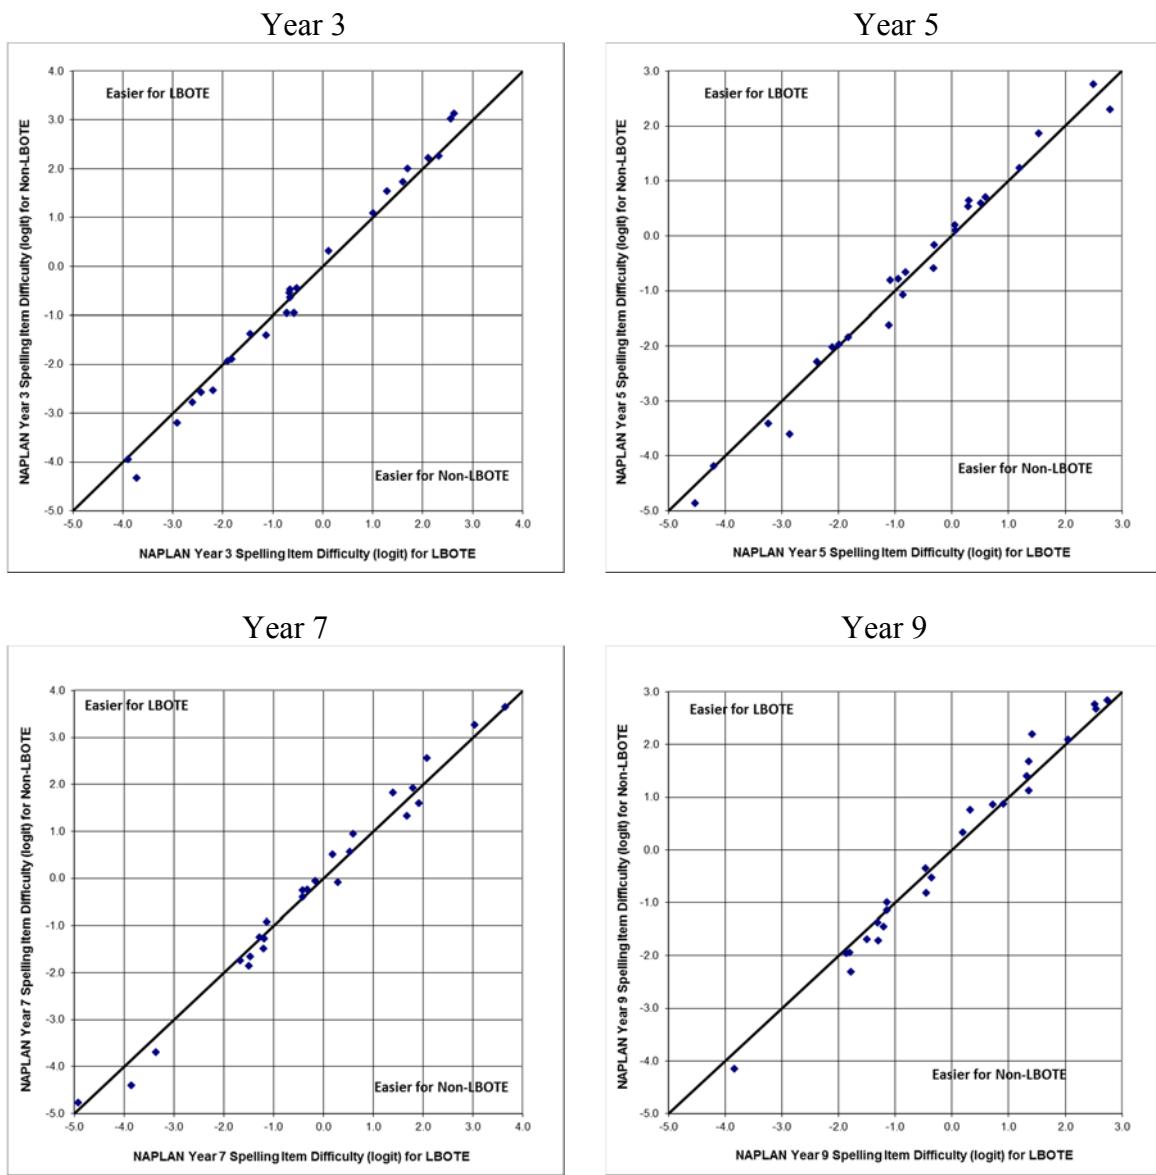

## APPENDIX G. LBOTE DIF ANALYSIS

---

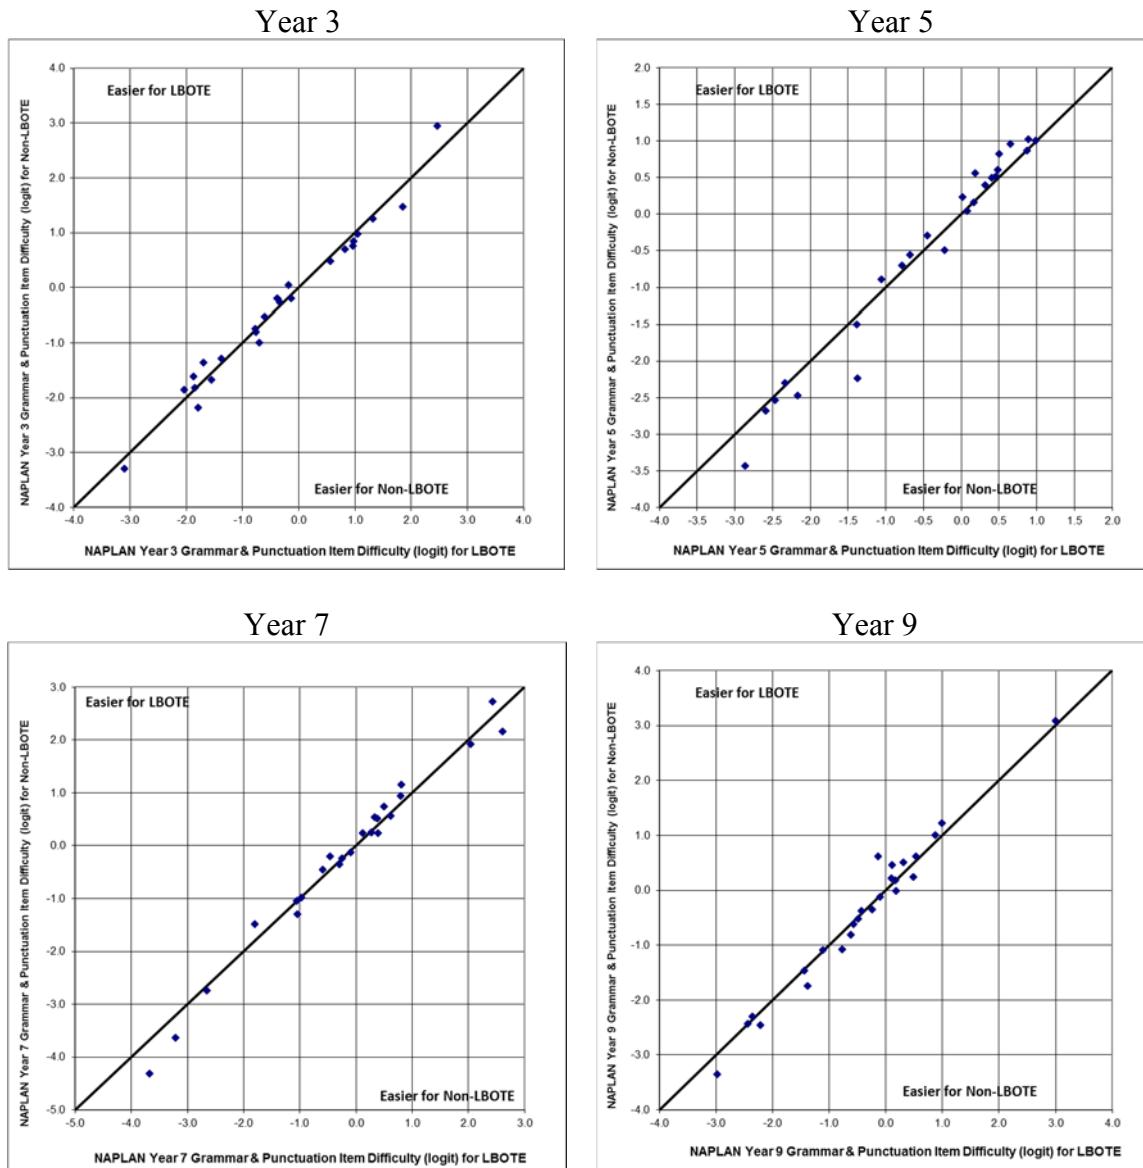

### G.1 Comparison of LBOTE and Non-LBOTE Students in Reading (2017)

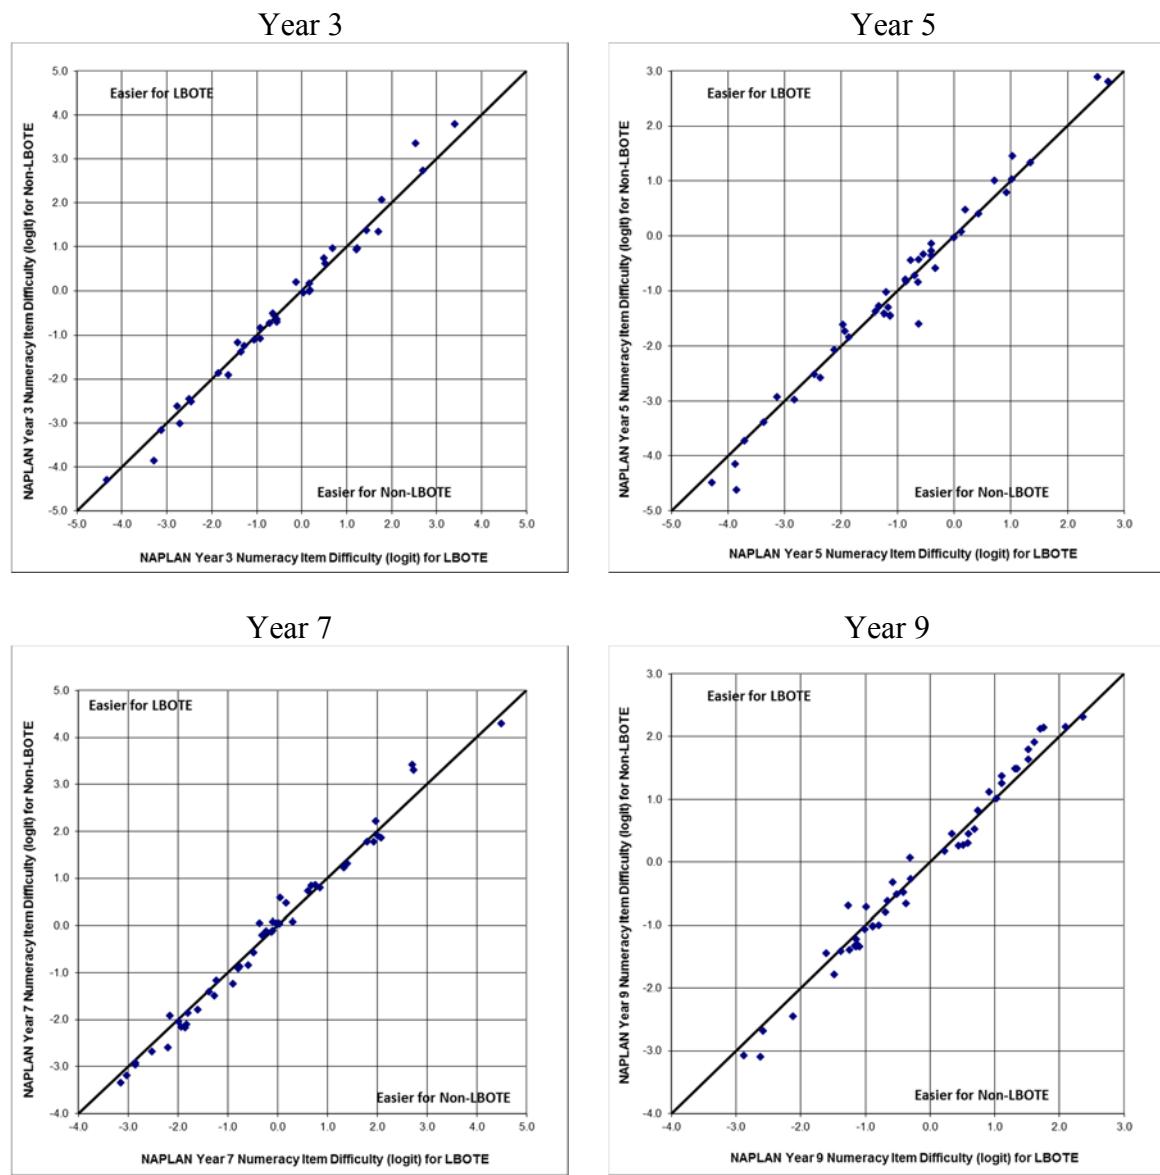

## G.2 Comparison of LBOTE and Non-LBOTE Students in Spelling (2017)

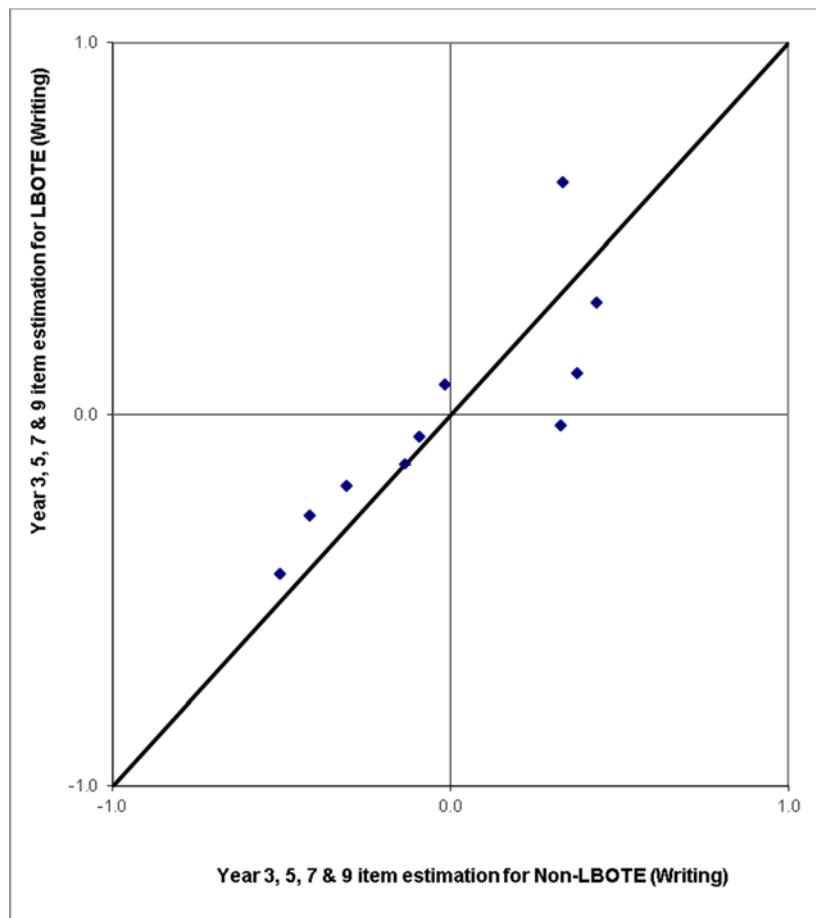

### G.3 Comparison of LBOTE and Non-LBOTE Students in Grammar and Punctuation (2017)

#### G.4 Comparison of LBOTE and Non-LBOTE Students in Numeracy (2017)

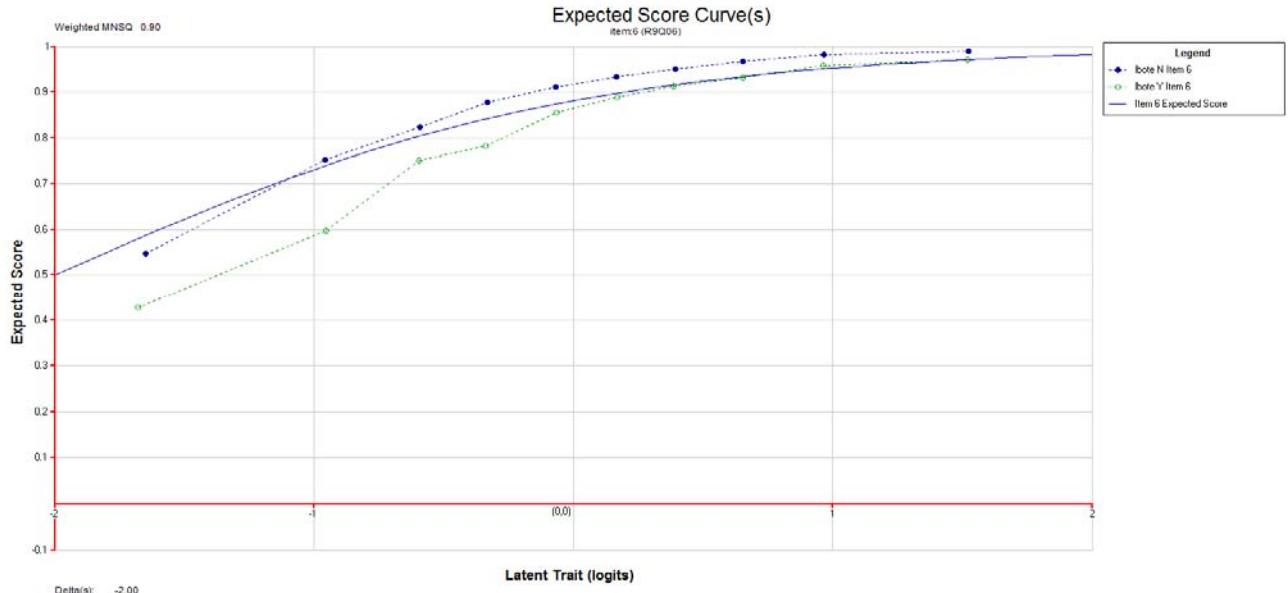

### G.5 Comparison of LBOTE and Non-LBOTE Students in Writing (2017)

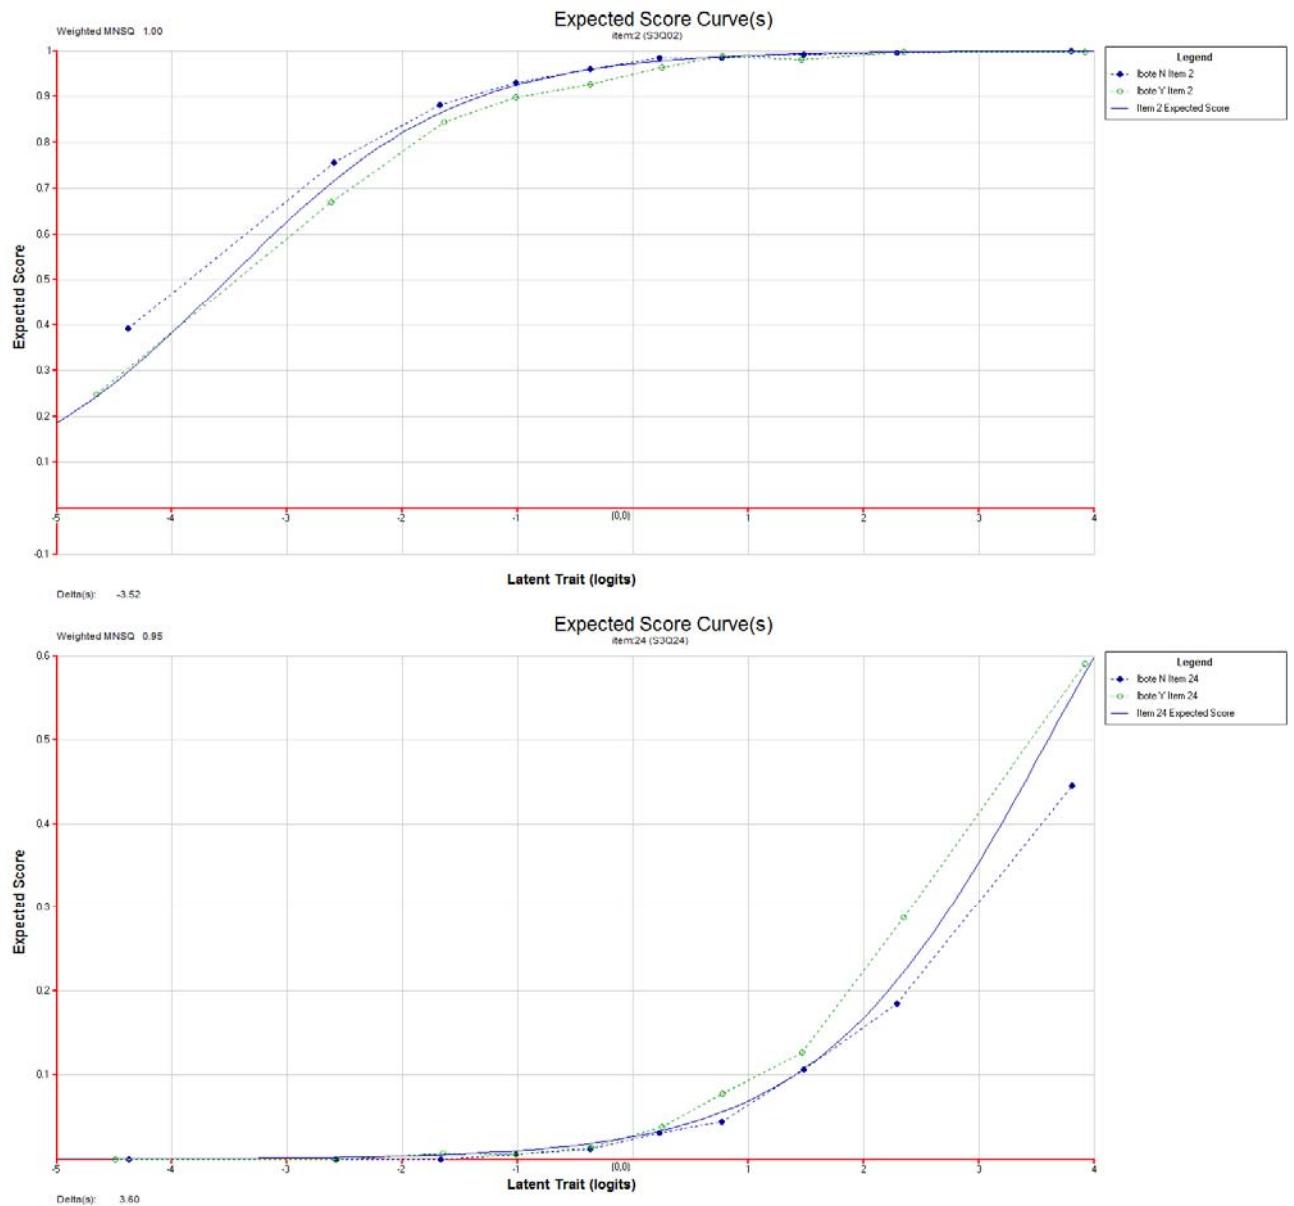

## G.6 Item DIF Plots for Items Showing LBOTE DIF<sup>2</sup>

### G.6.1. Year 9 Reading

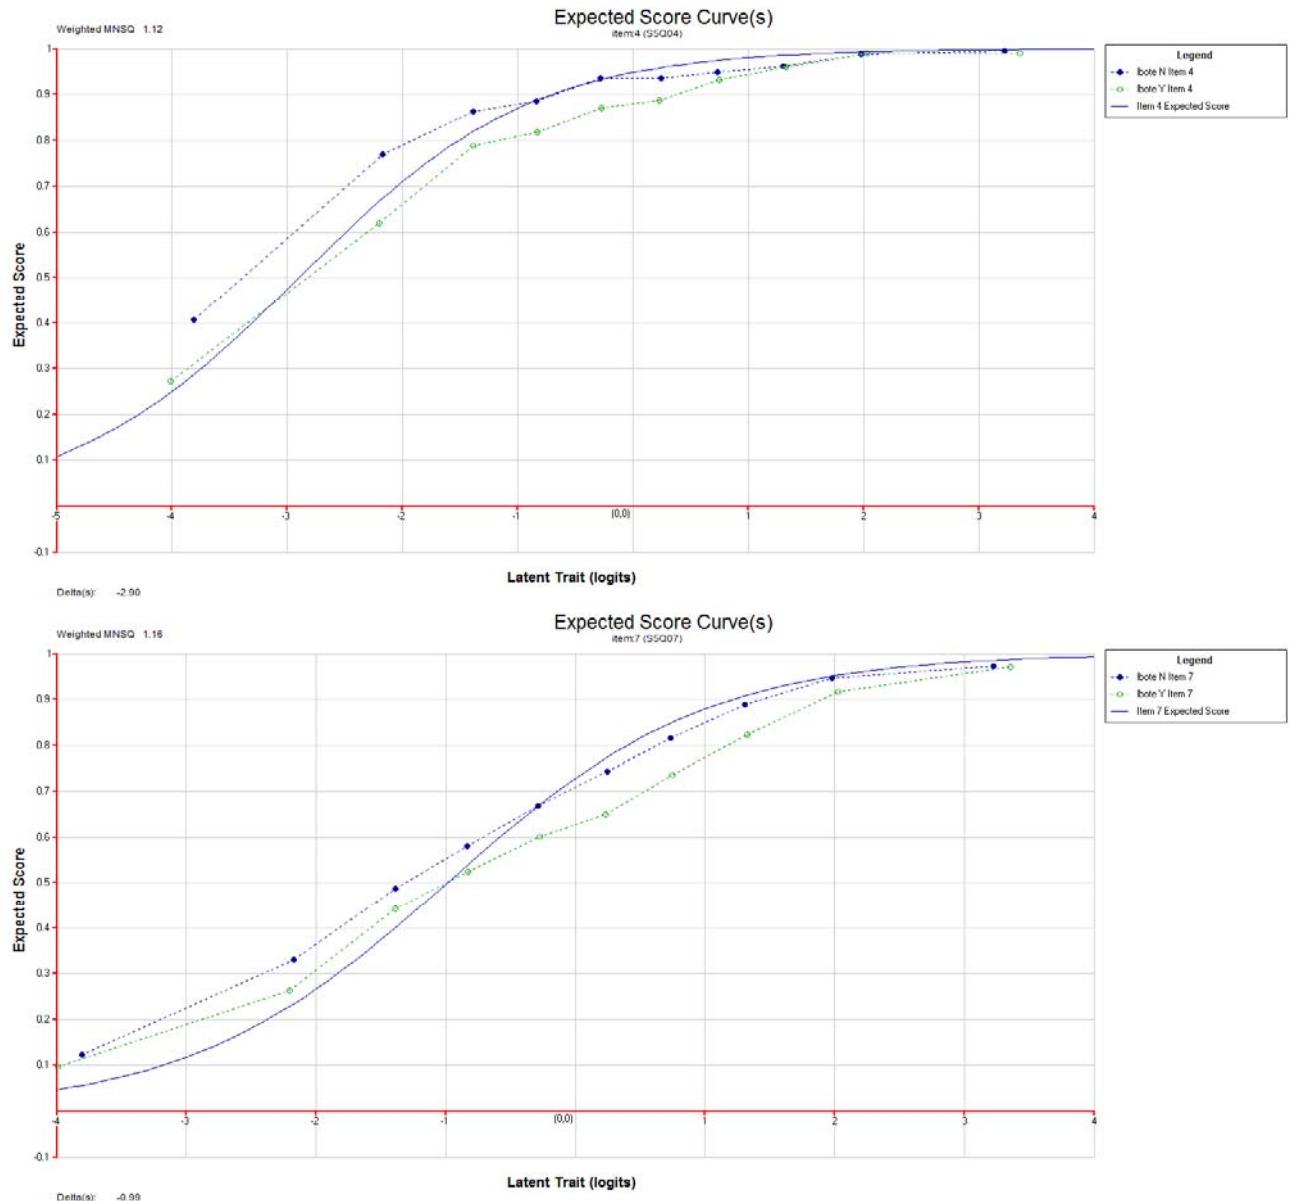

<sup>2</sup> 'lbote N' indicates 'Non-LBOTE group' and 'lbote Y' indicates 'LBOTE group'.

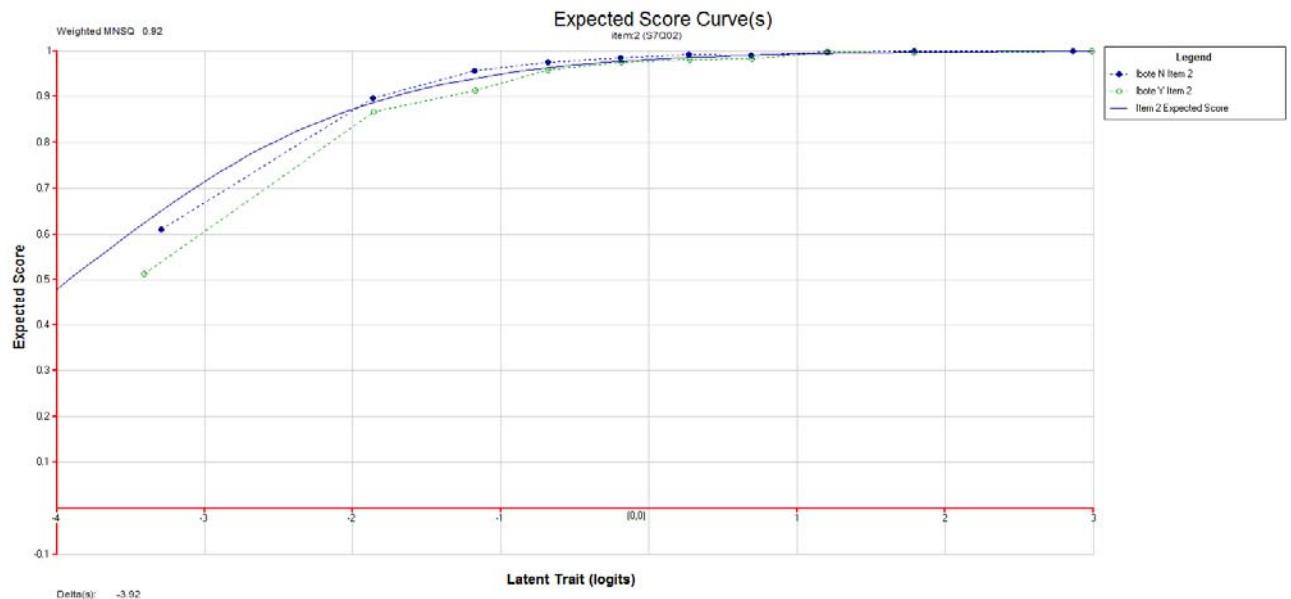

### G.6.2. Year 3 Spelling

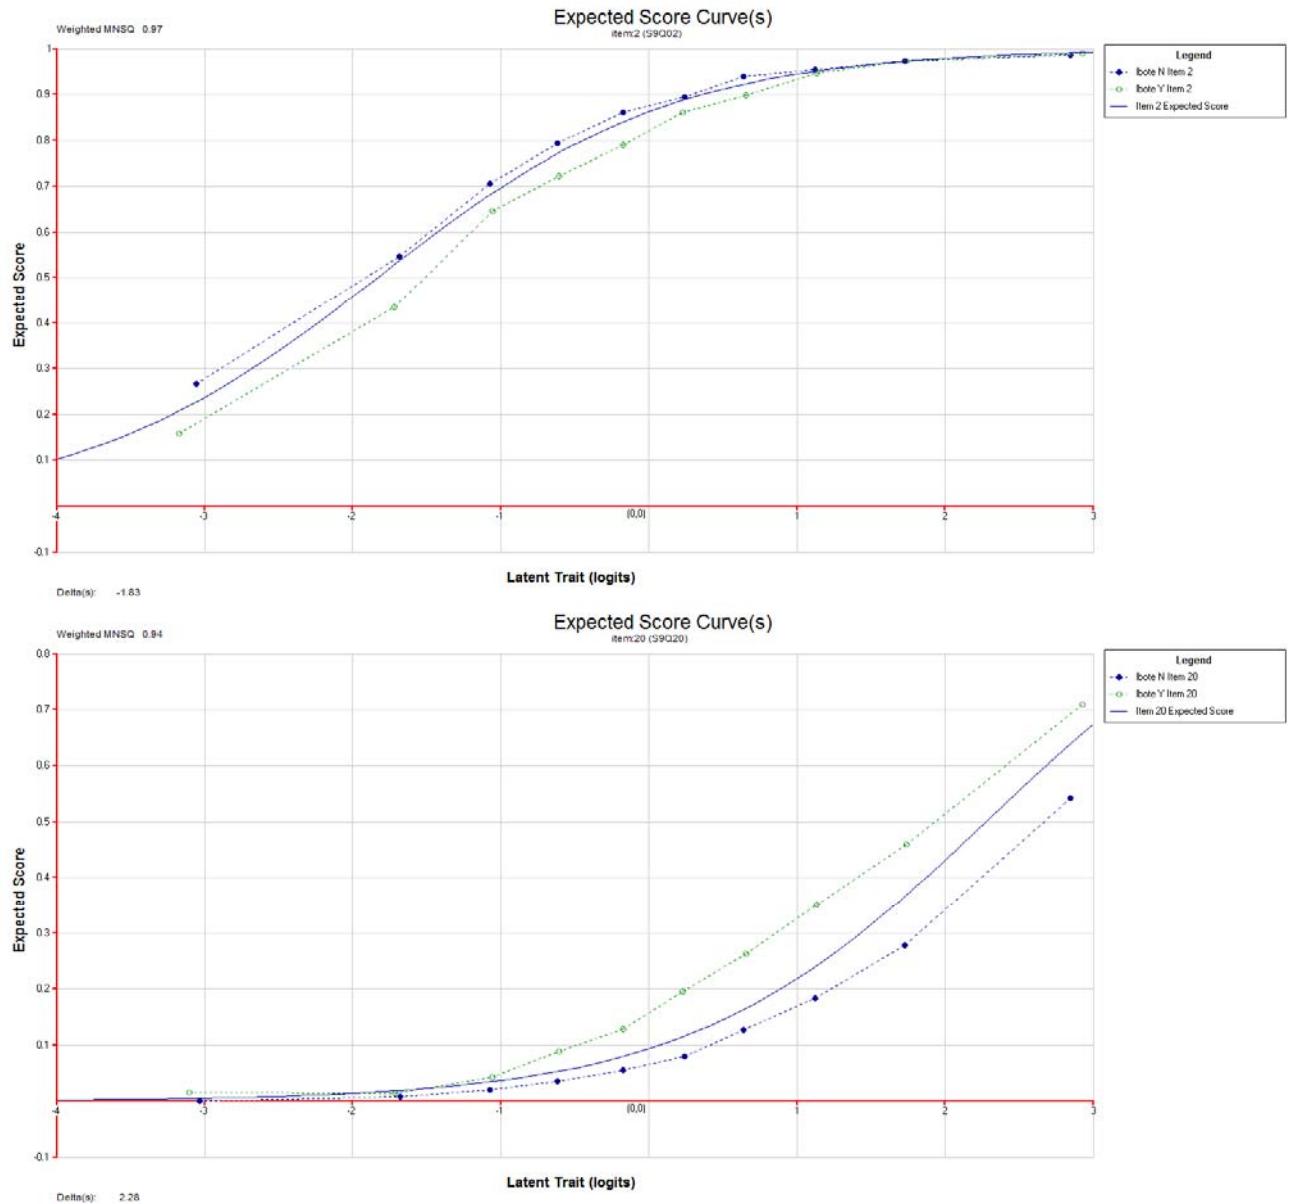

### G.6.3. Year 5 Spelling

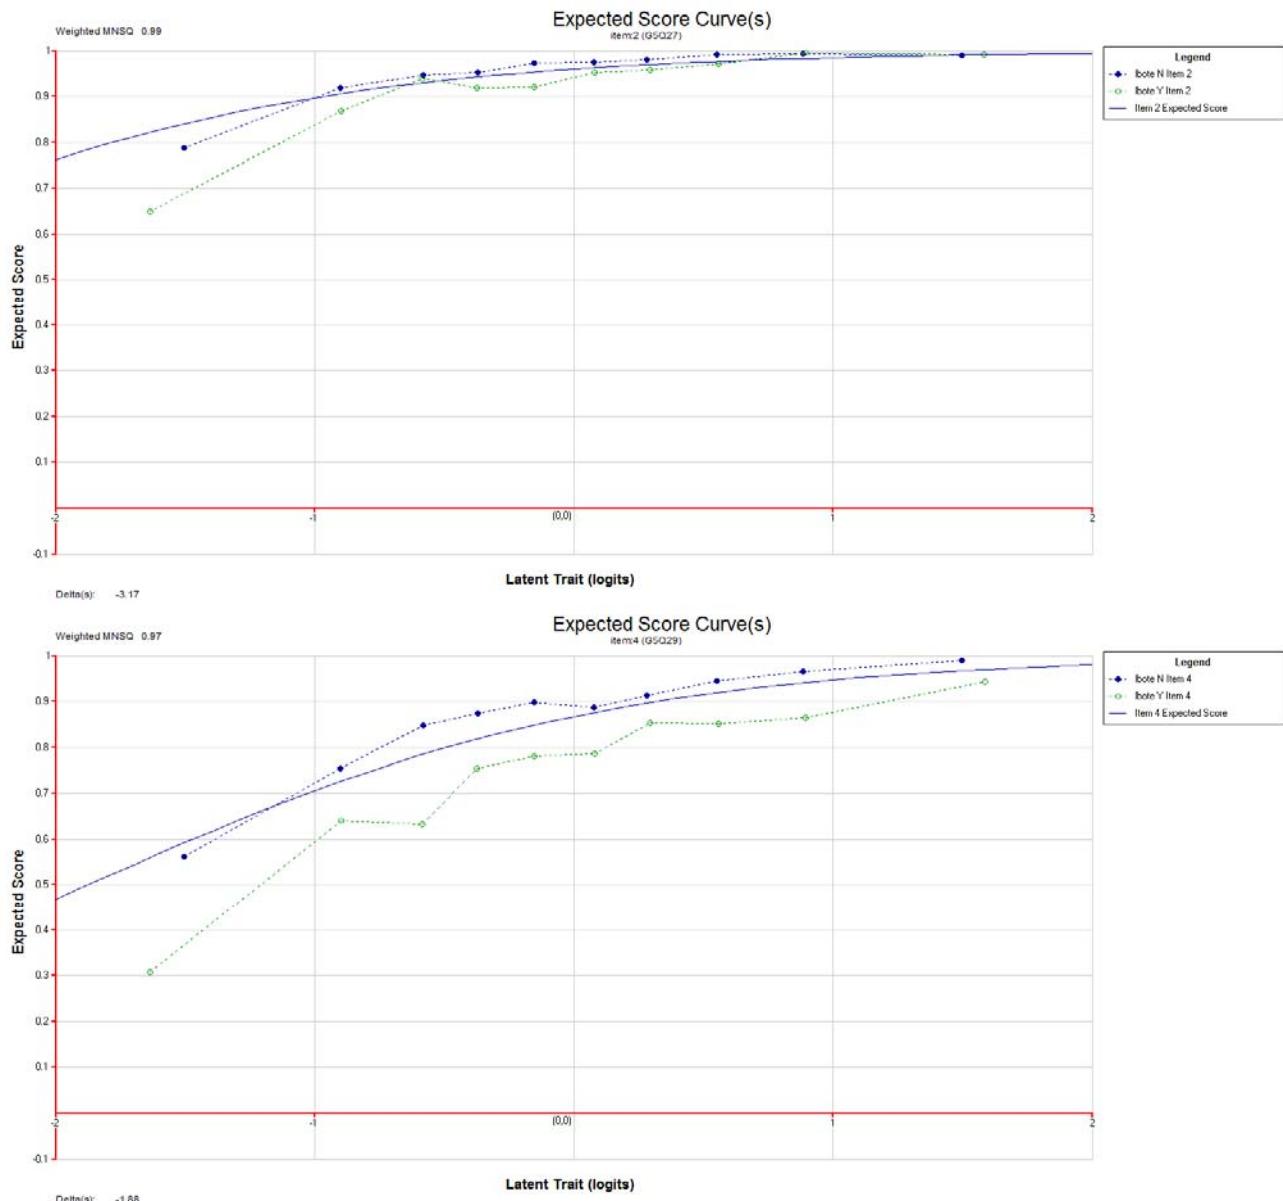

#### G.6.4. Year 7 Spelling

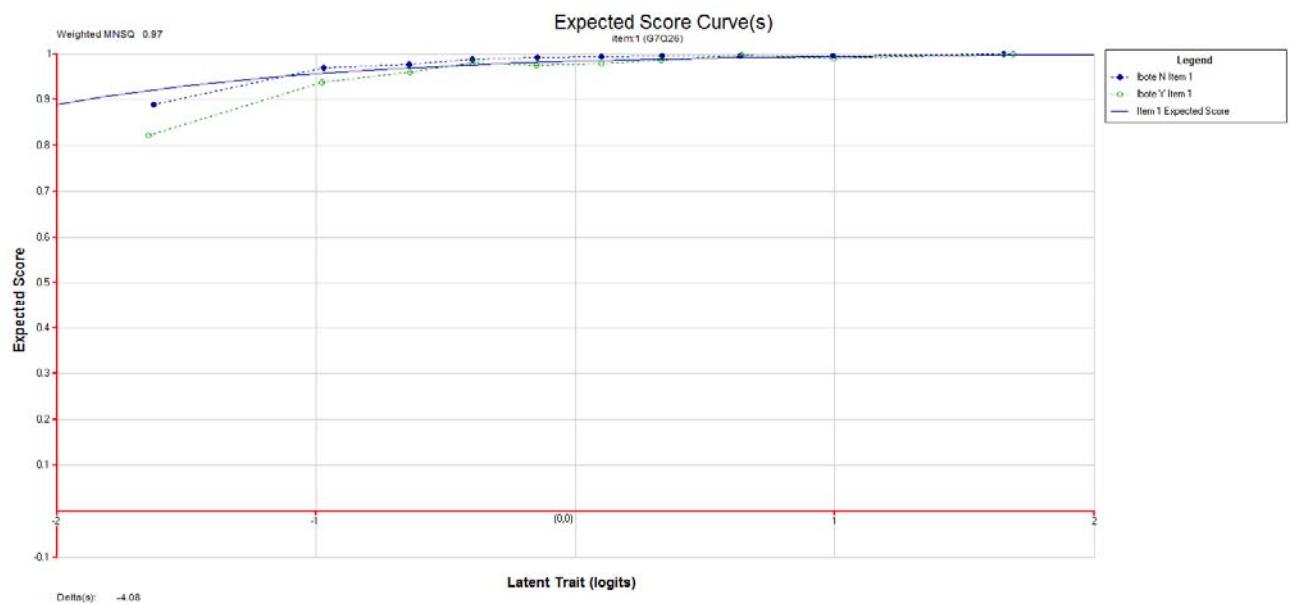

### G.6.5. Year 9 Spelling

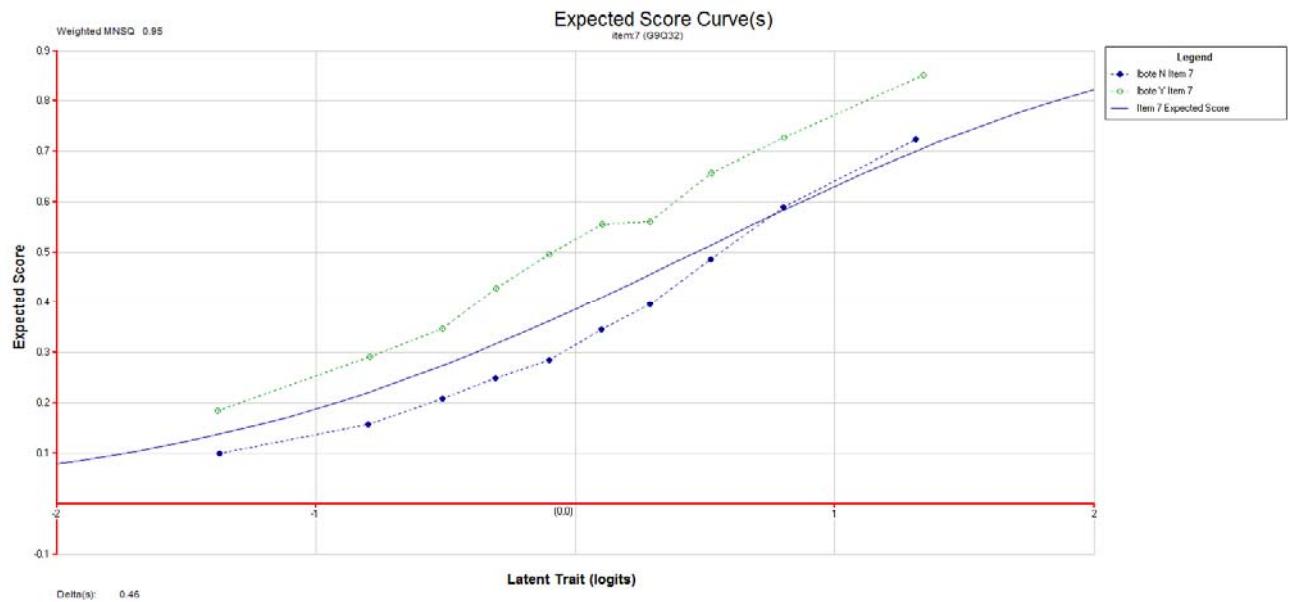

### G.6.6. Year 5 Grammar and Punctuation

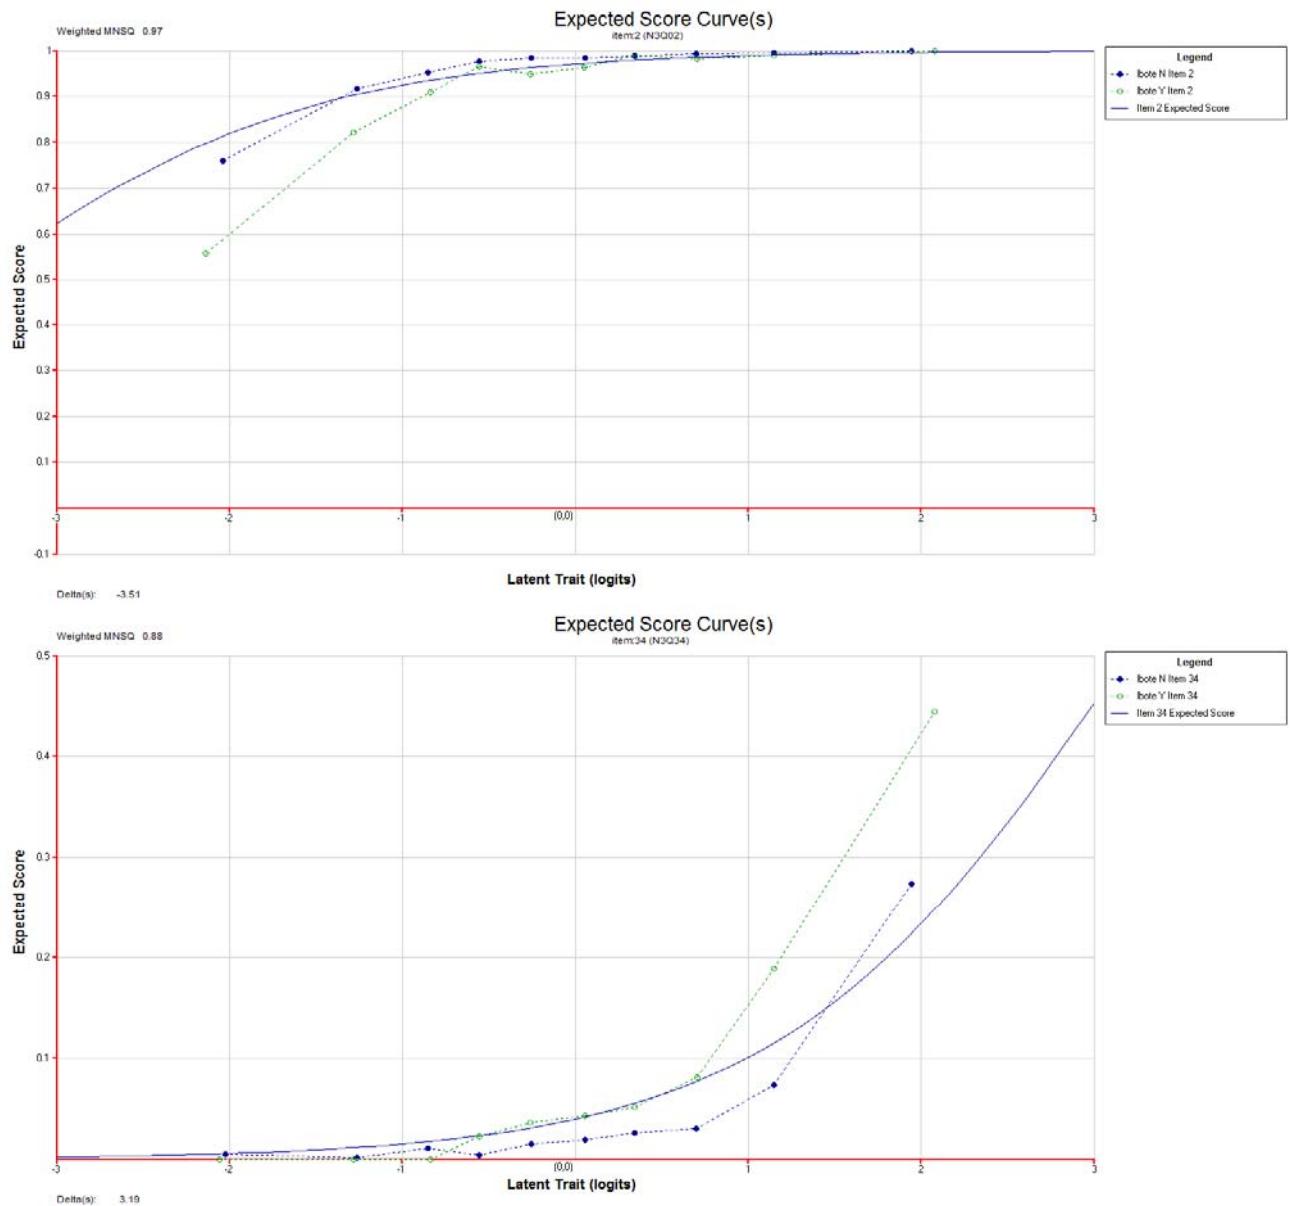

### G.6.7. Year 7 Grammar and Punctuation

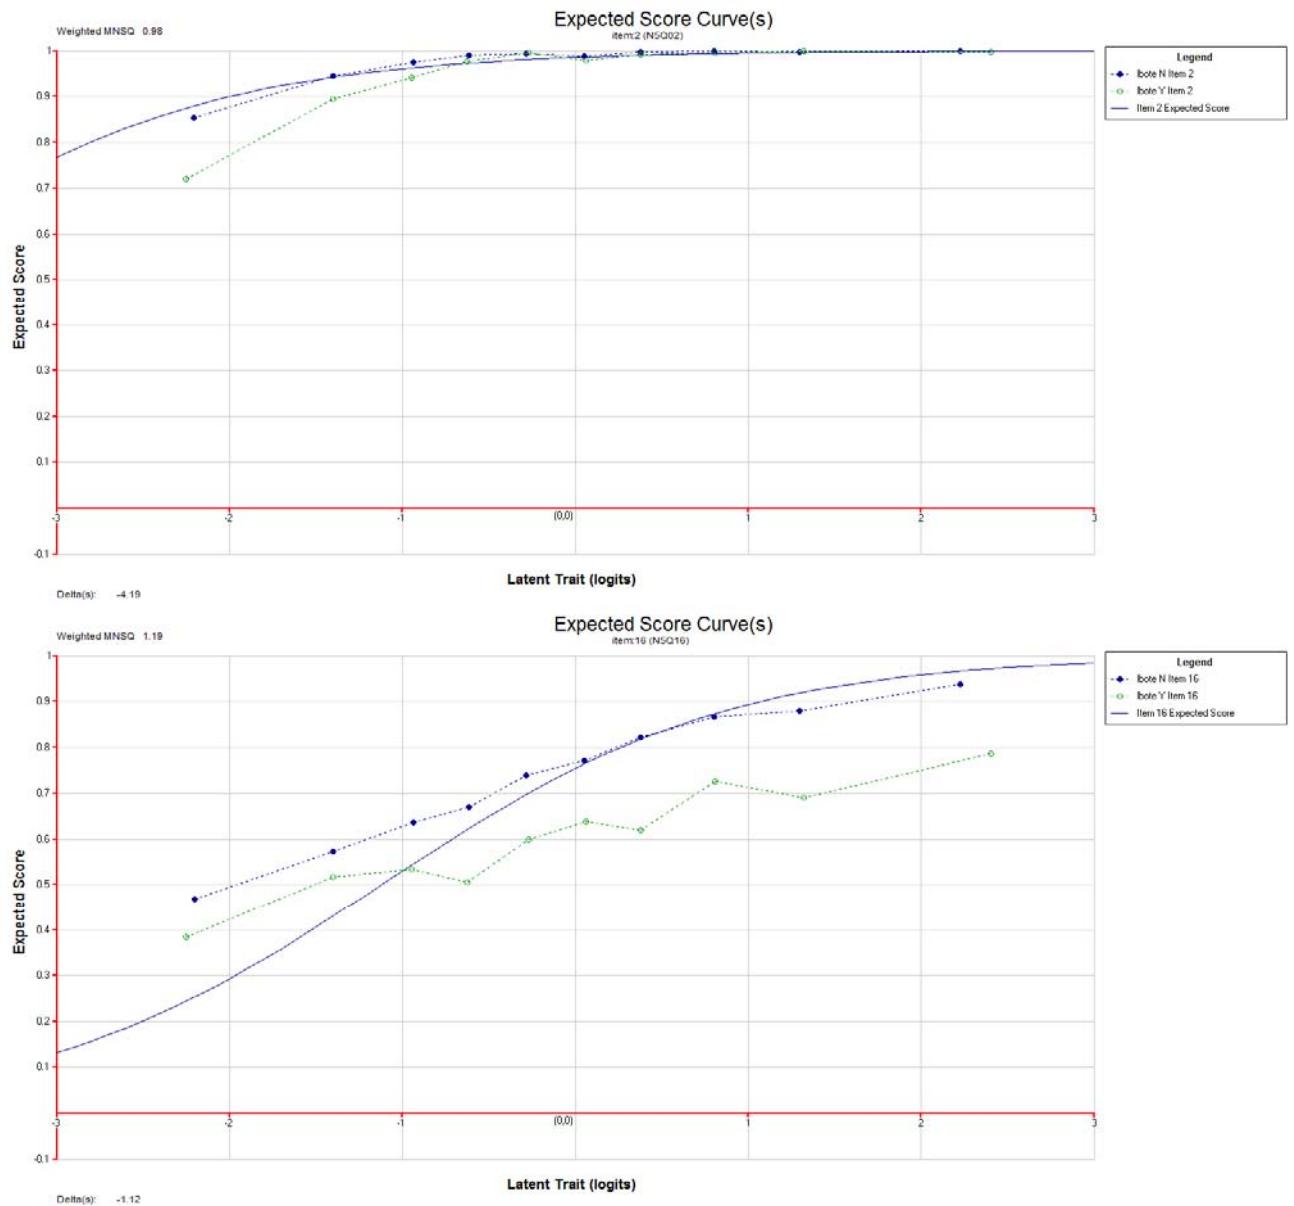

### G.6.8. Year 9 Grammar and Punctuation

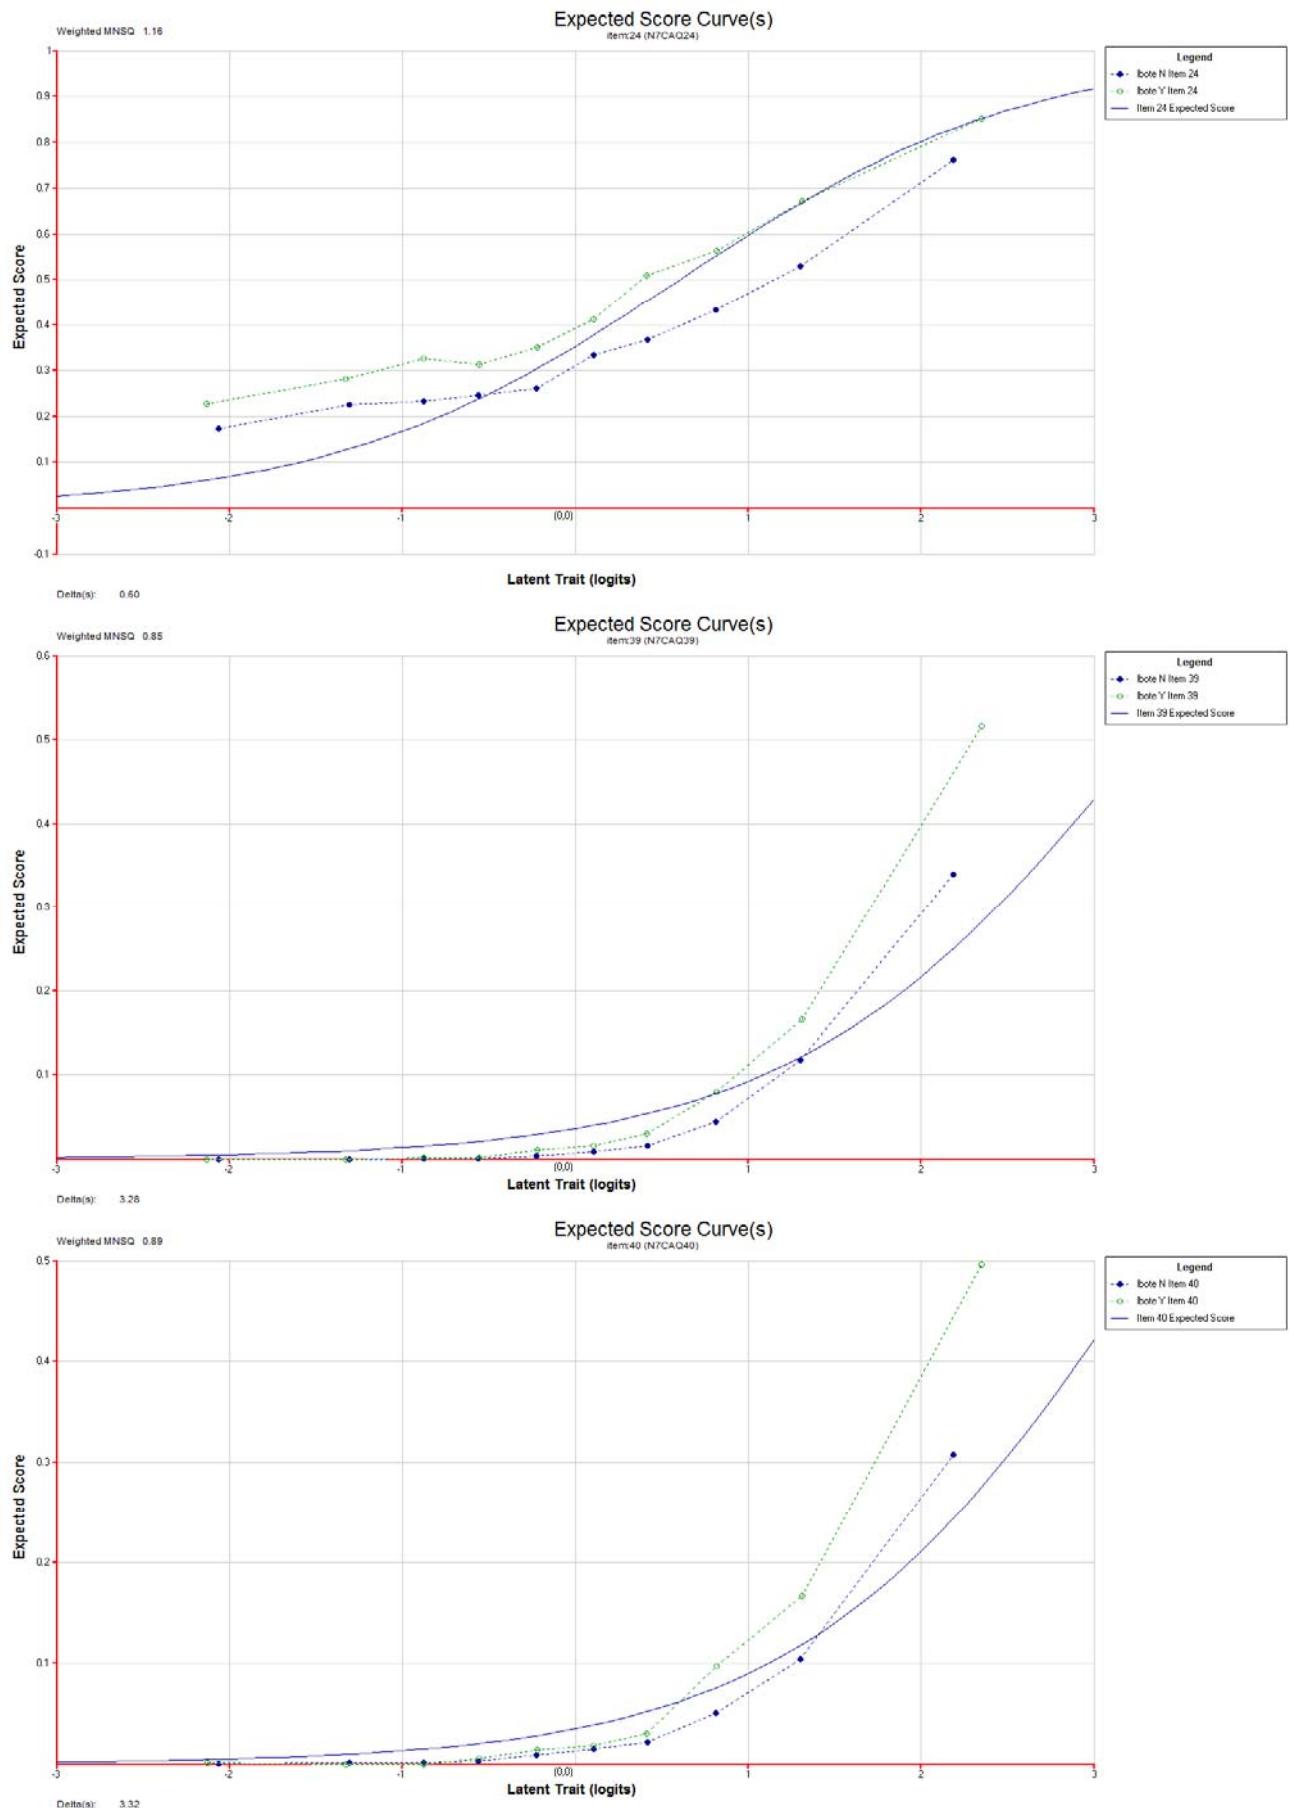

### G.6.9. Year 3 Numeracy

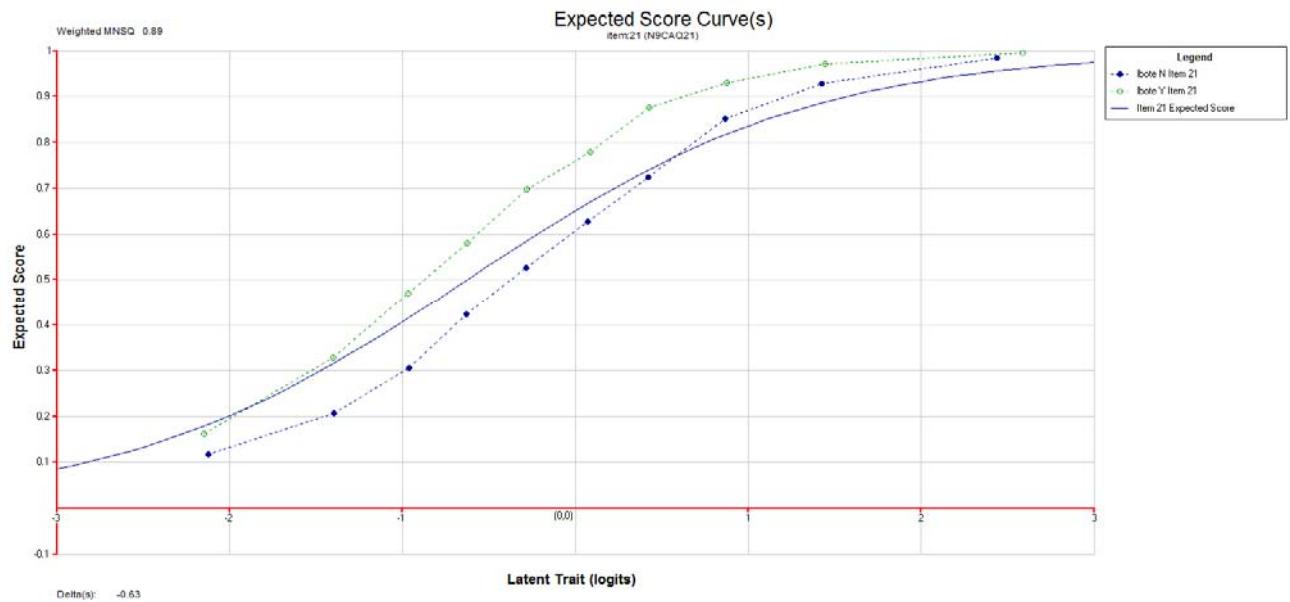

### G.6.10. Year 5 Numeracy

### G.6.11. Year 7 Numeracy

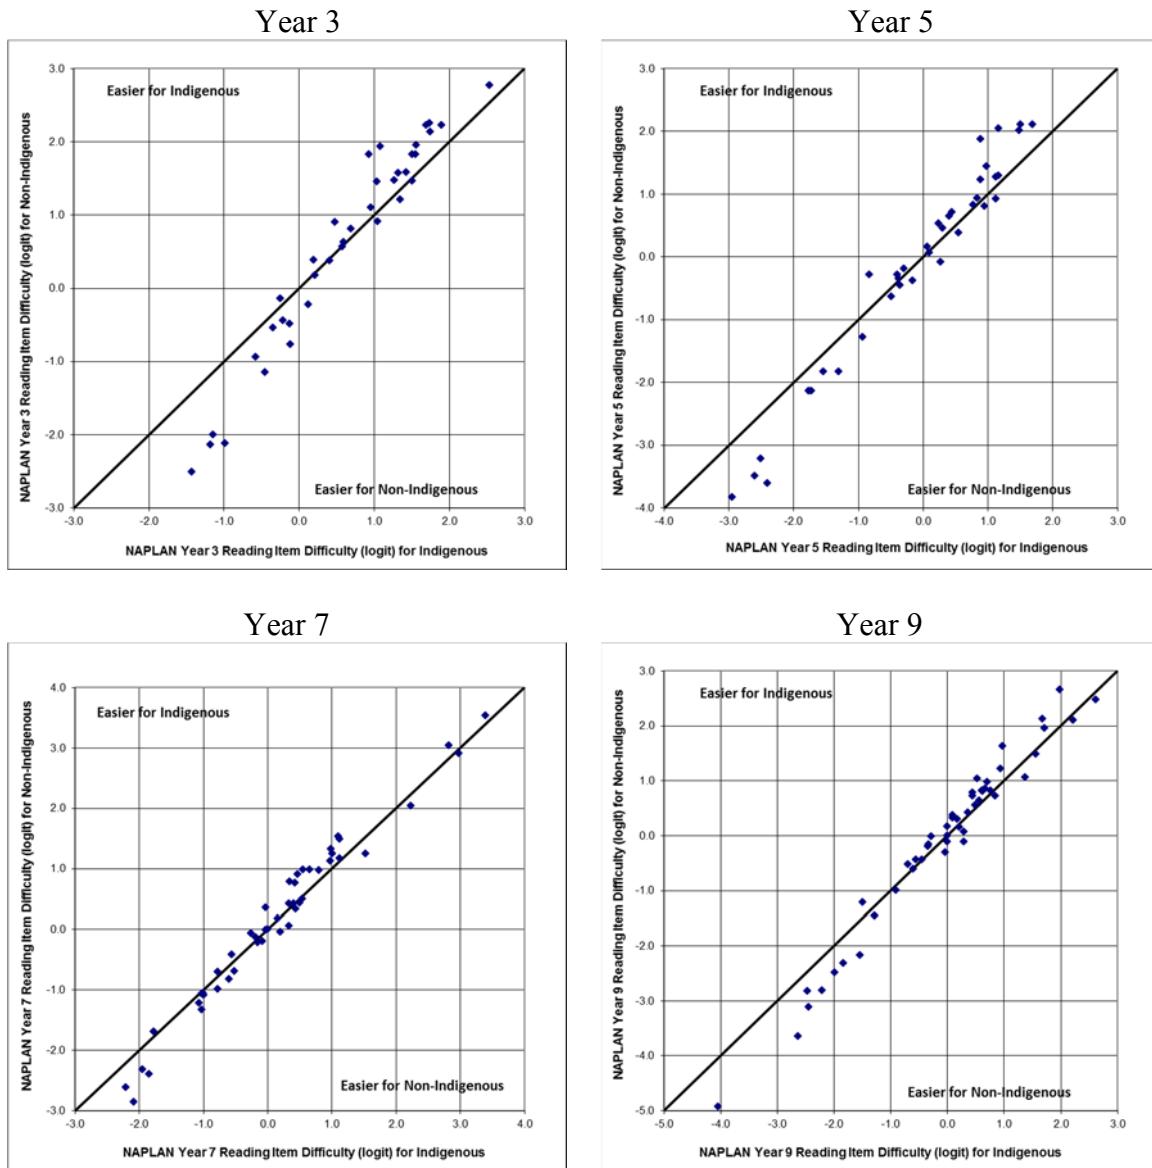

### G.6.12. Year 9 Numeracy

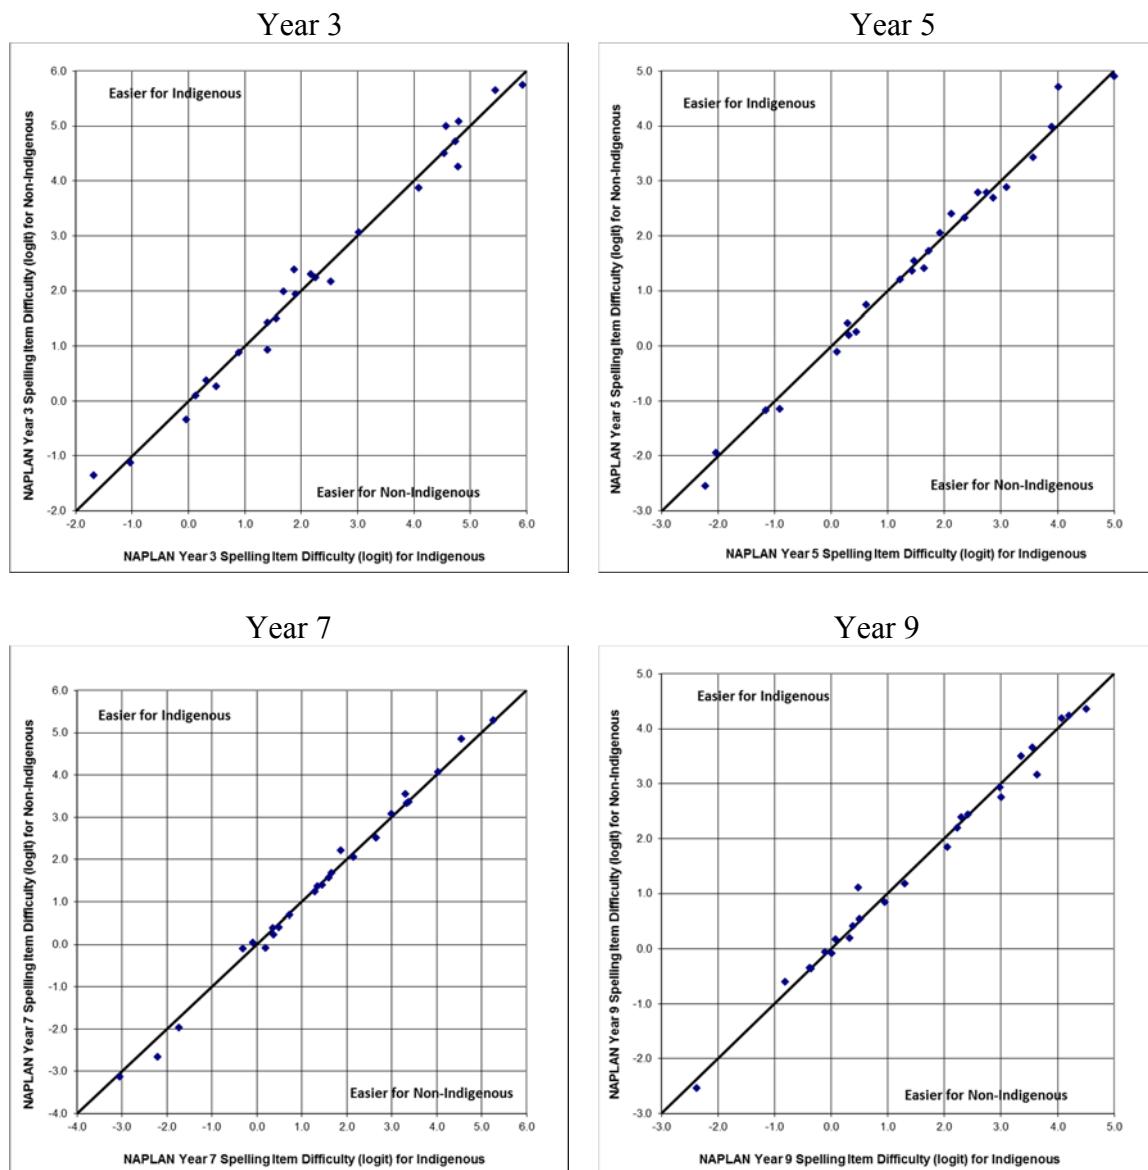

## APPENDIX H. INDIGENOUS STATUS DIF ANALYSIS

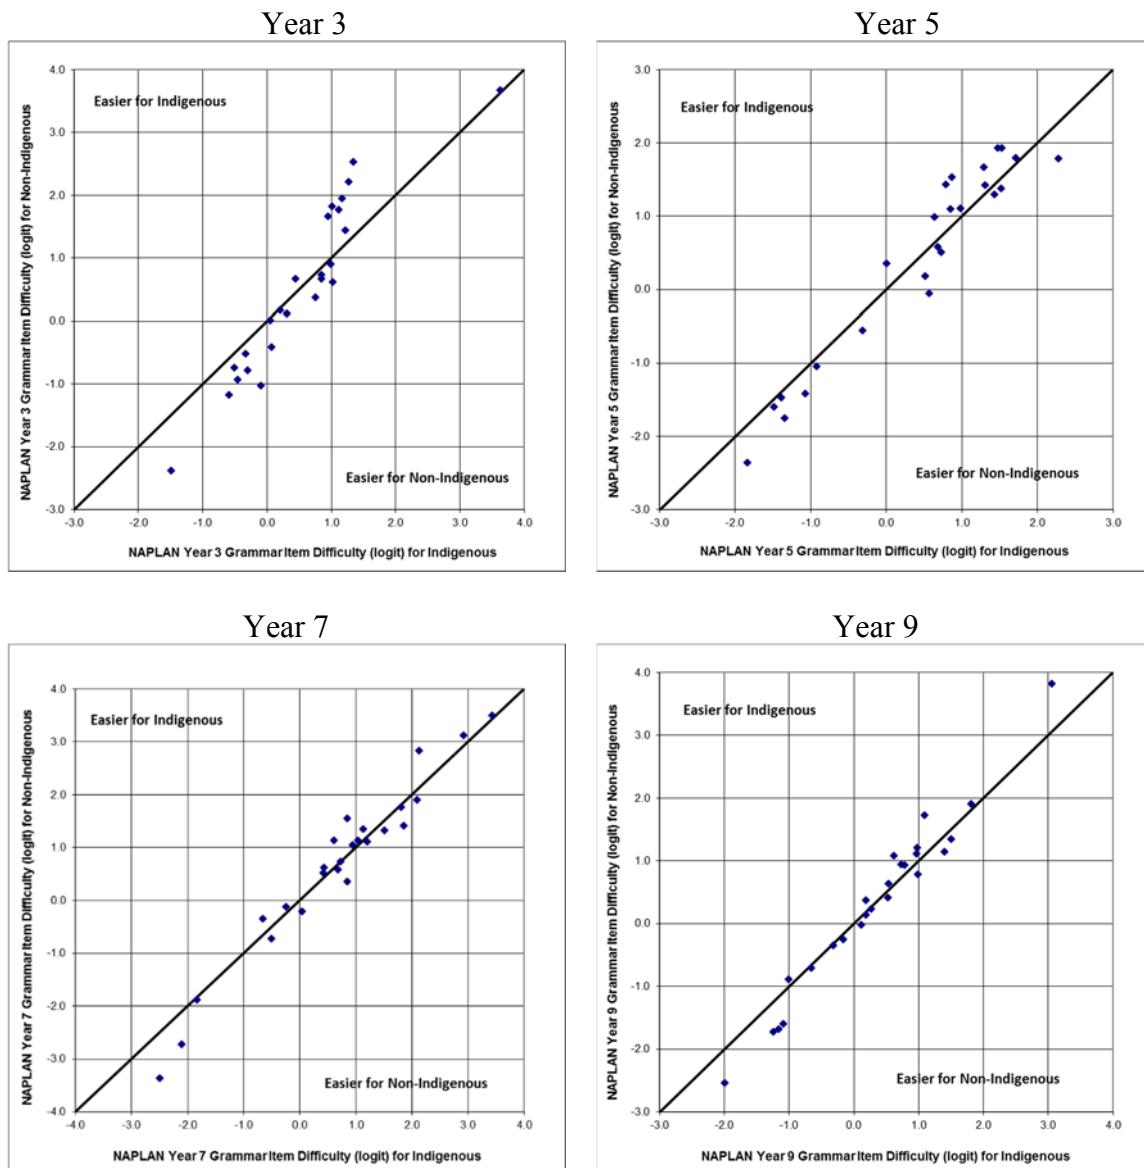

### H.1 Comparison of Indigenous and Non- Indigenous Students in Reading (2017)

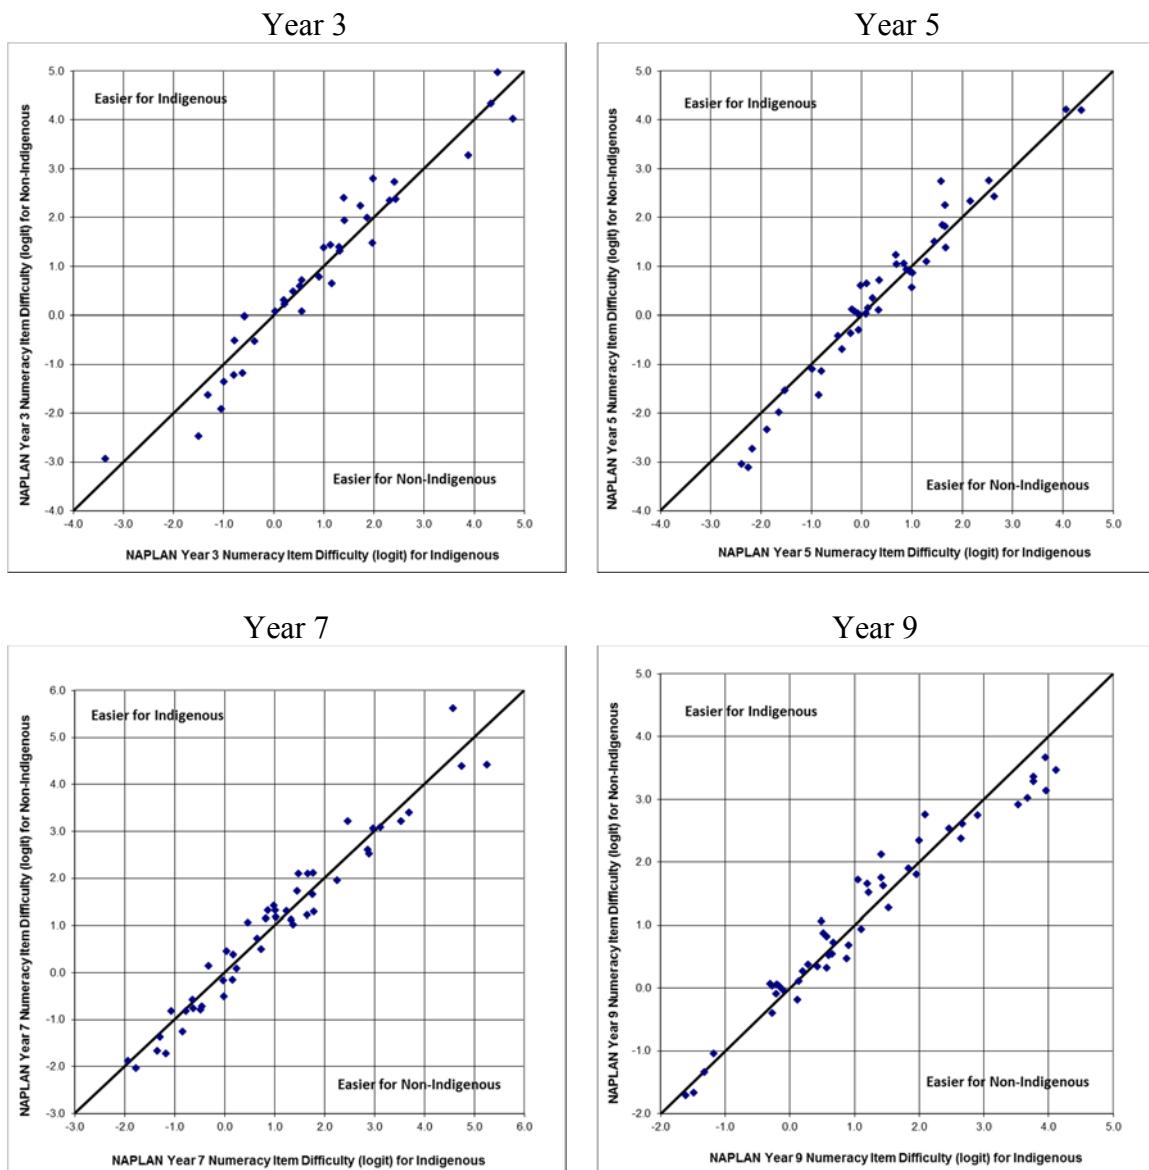

## H.2 Comparison of Indigenous and Non- Indigenous Students in Spelling (2017)

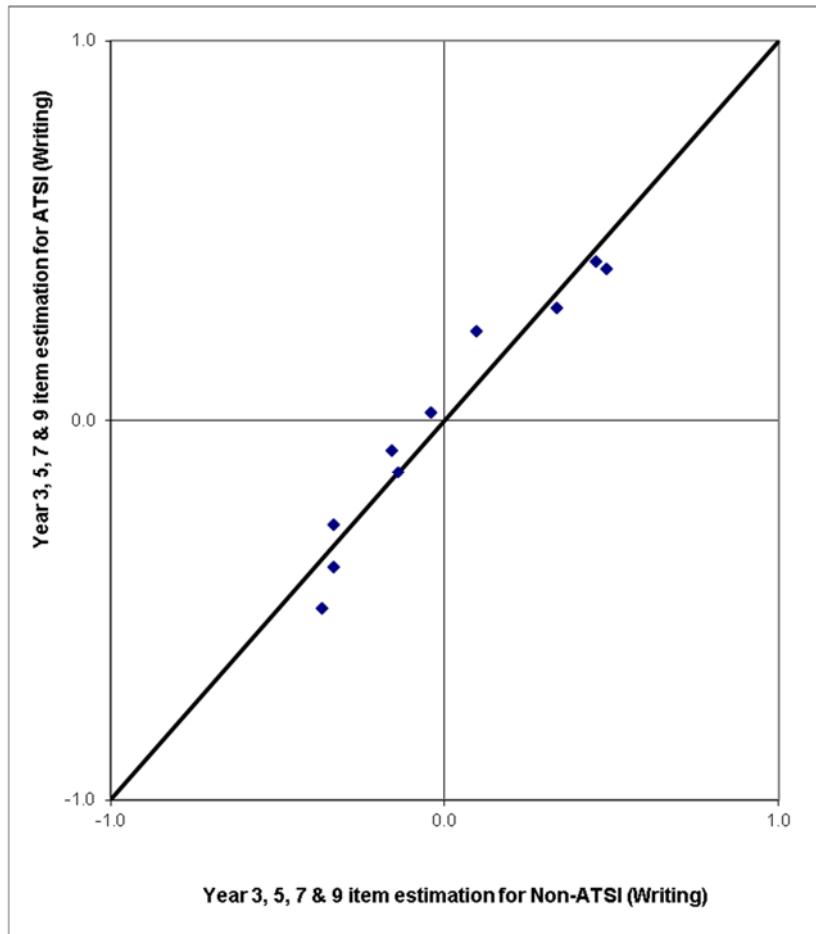

### H.3 Comparison of Indigenous and Non- Indigenous Students in Grammar and Punctuation (2017)

#### H.4 Comparison of Indigenous and Non- Indigenous Students in Numeracy (2017)

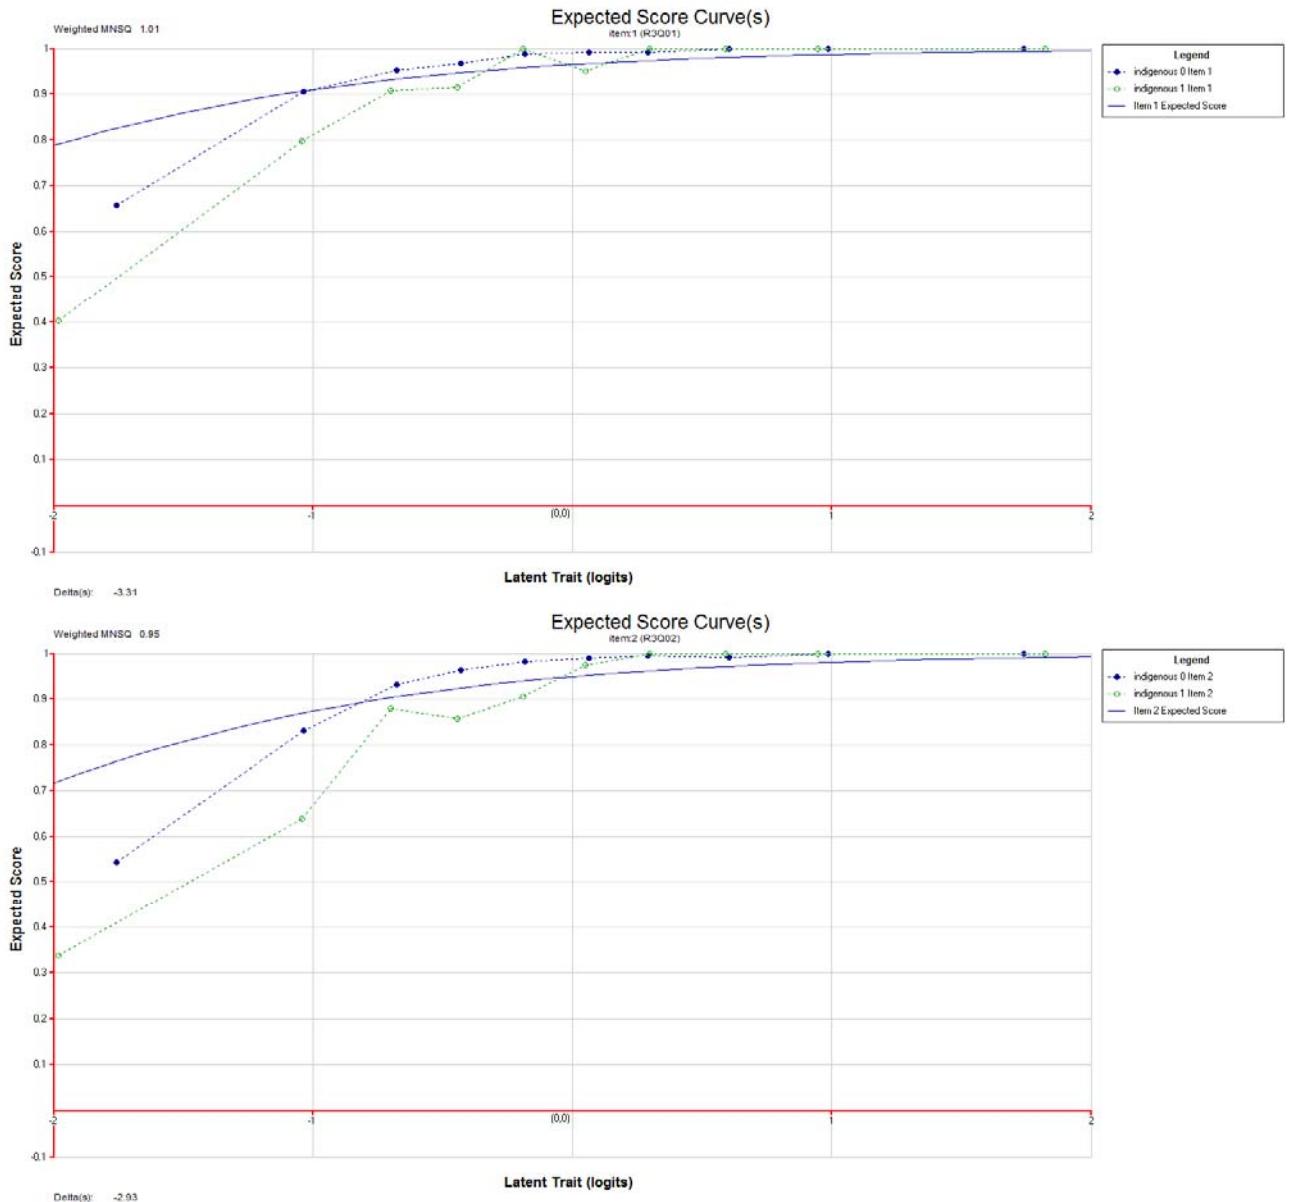

### H.5 Comparison of Indigenous and Non- Indigenous Students in Writing (2017)

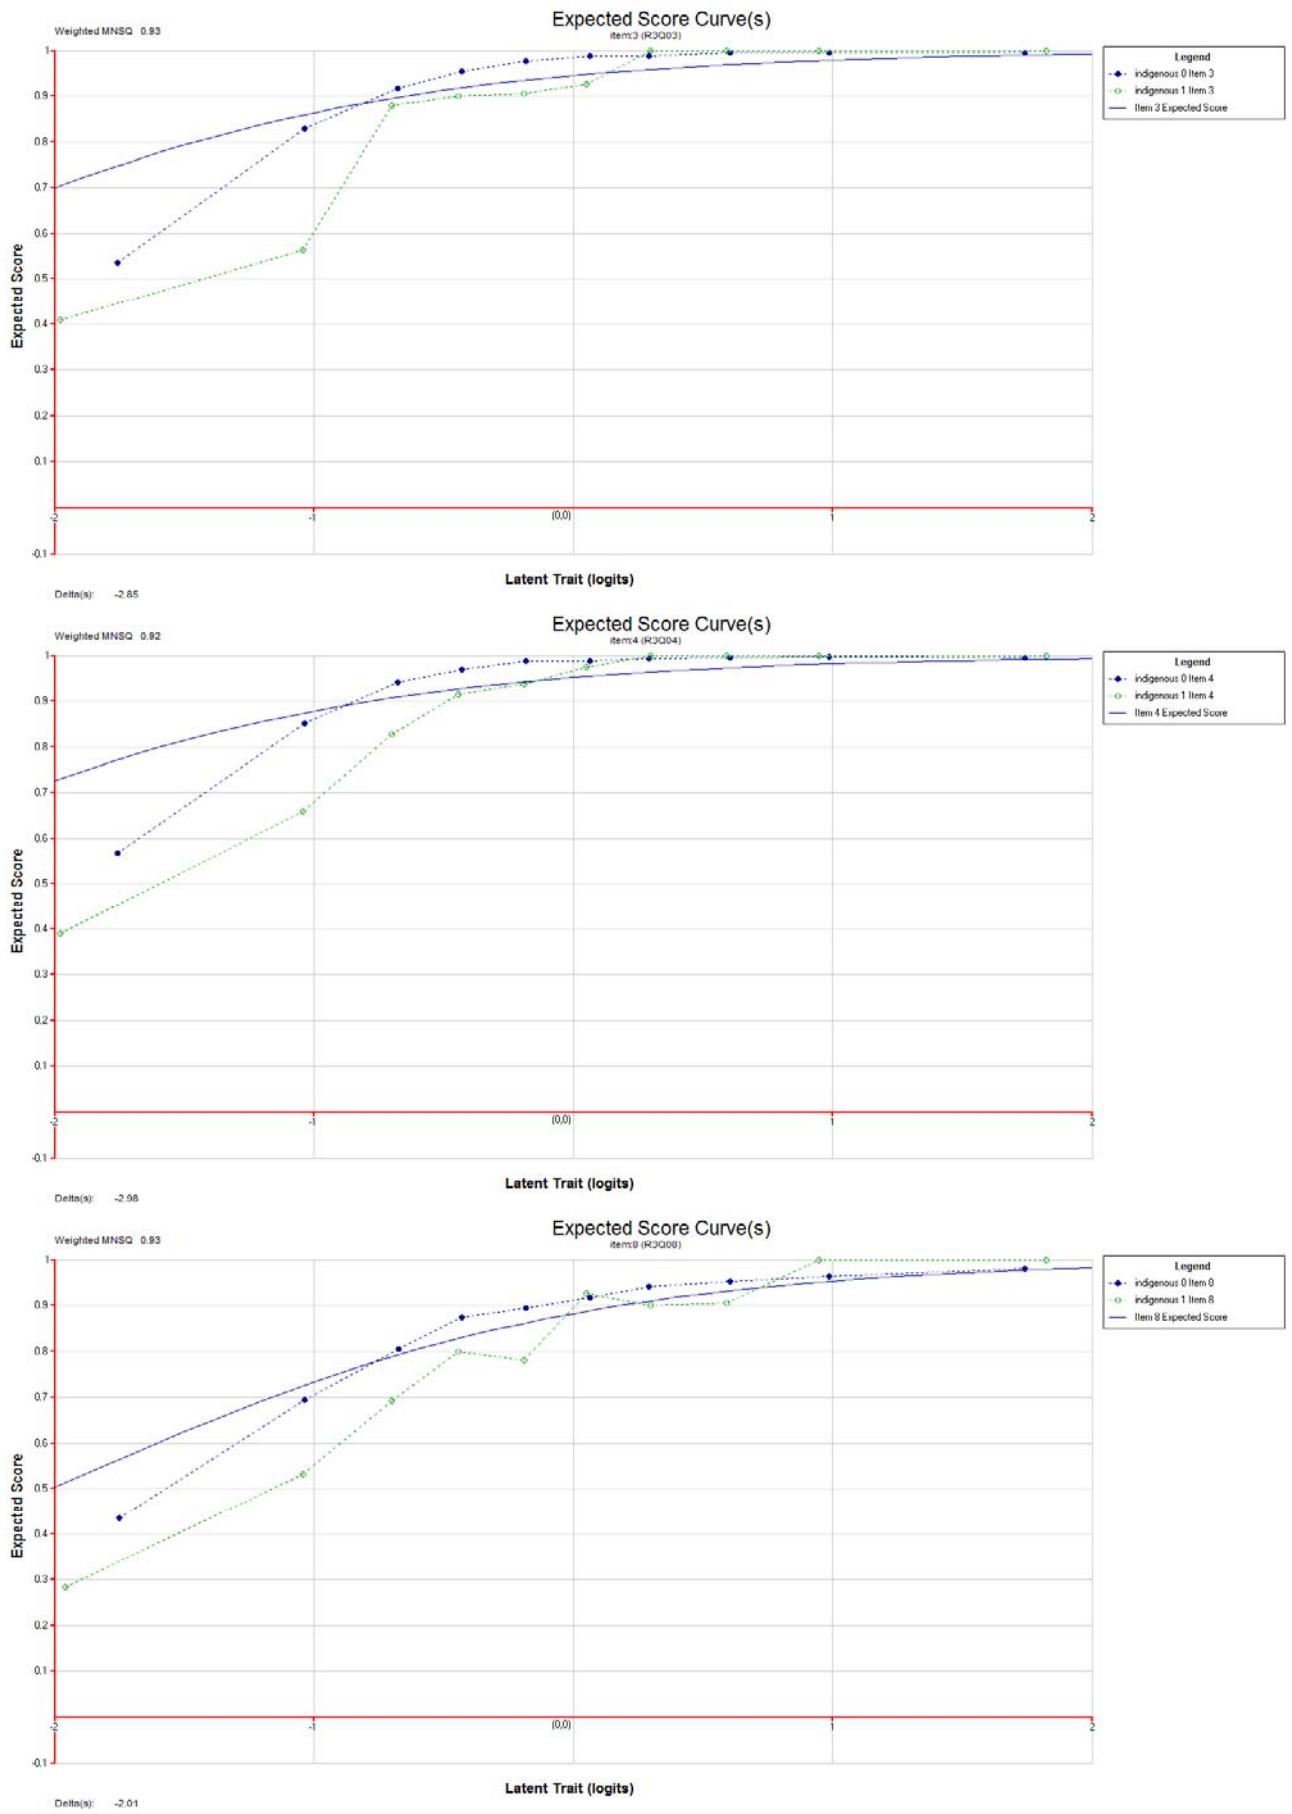

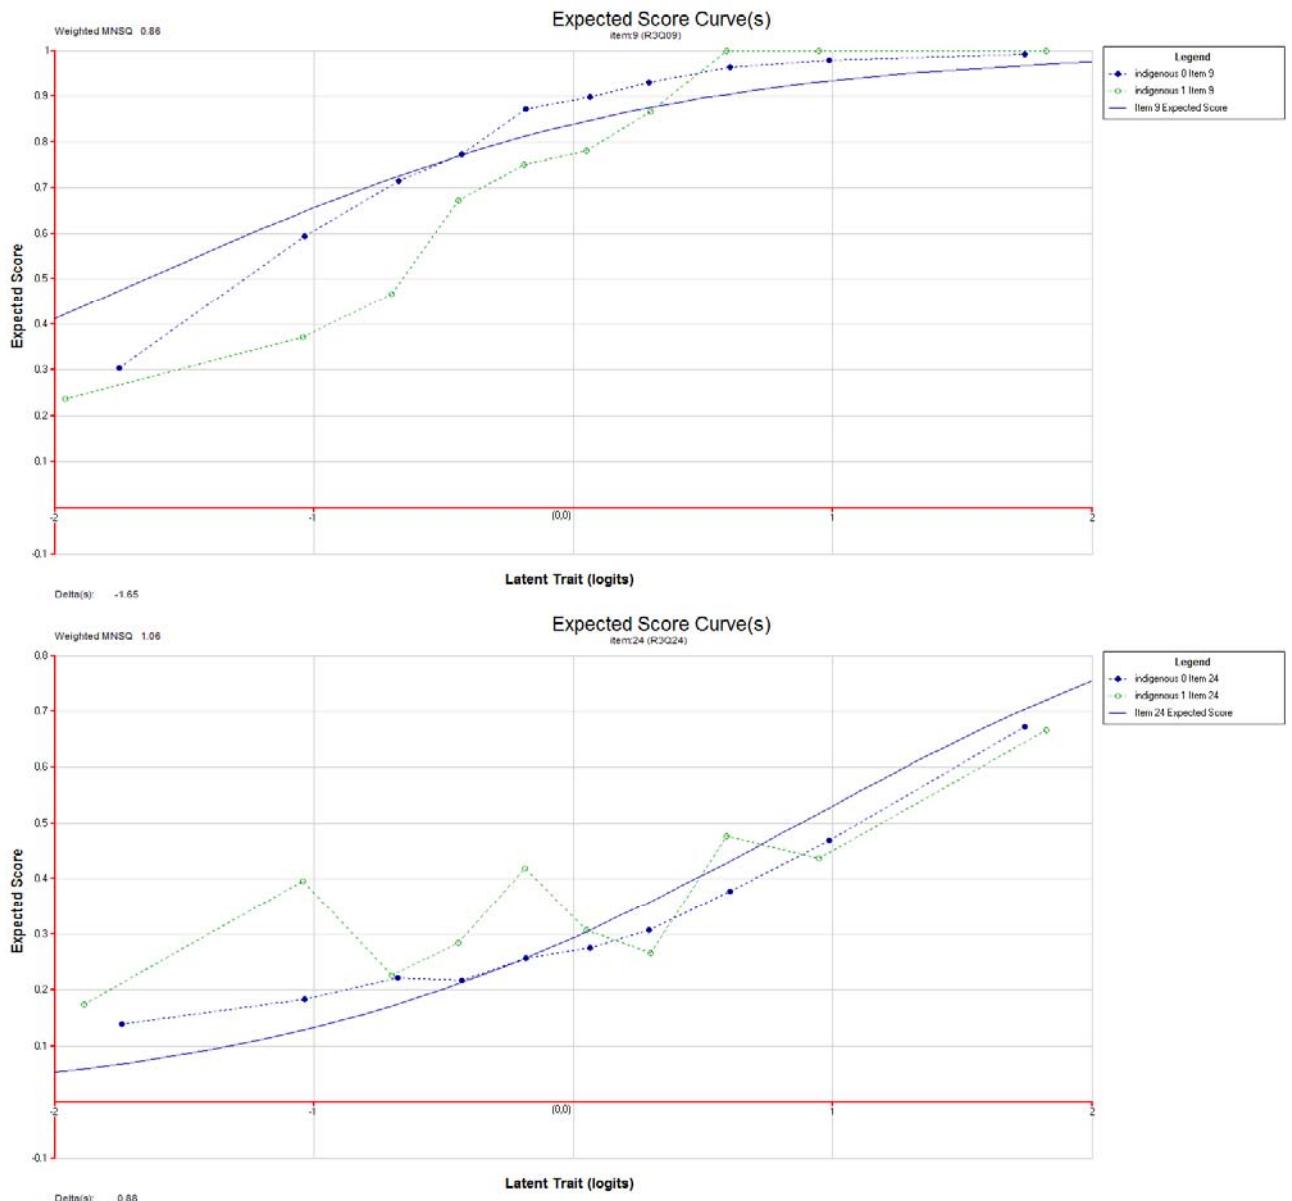

## H.6 Item DIF Plots for Items Showing Indigenous Status DIF<sup>3</sup>

### H.6.1. Year 3 Reading

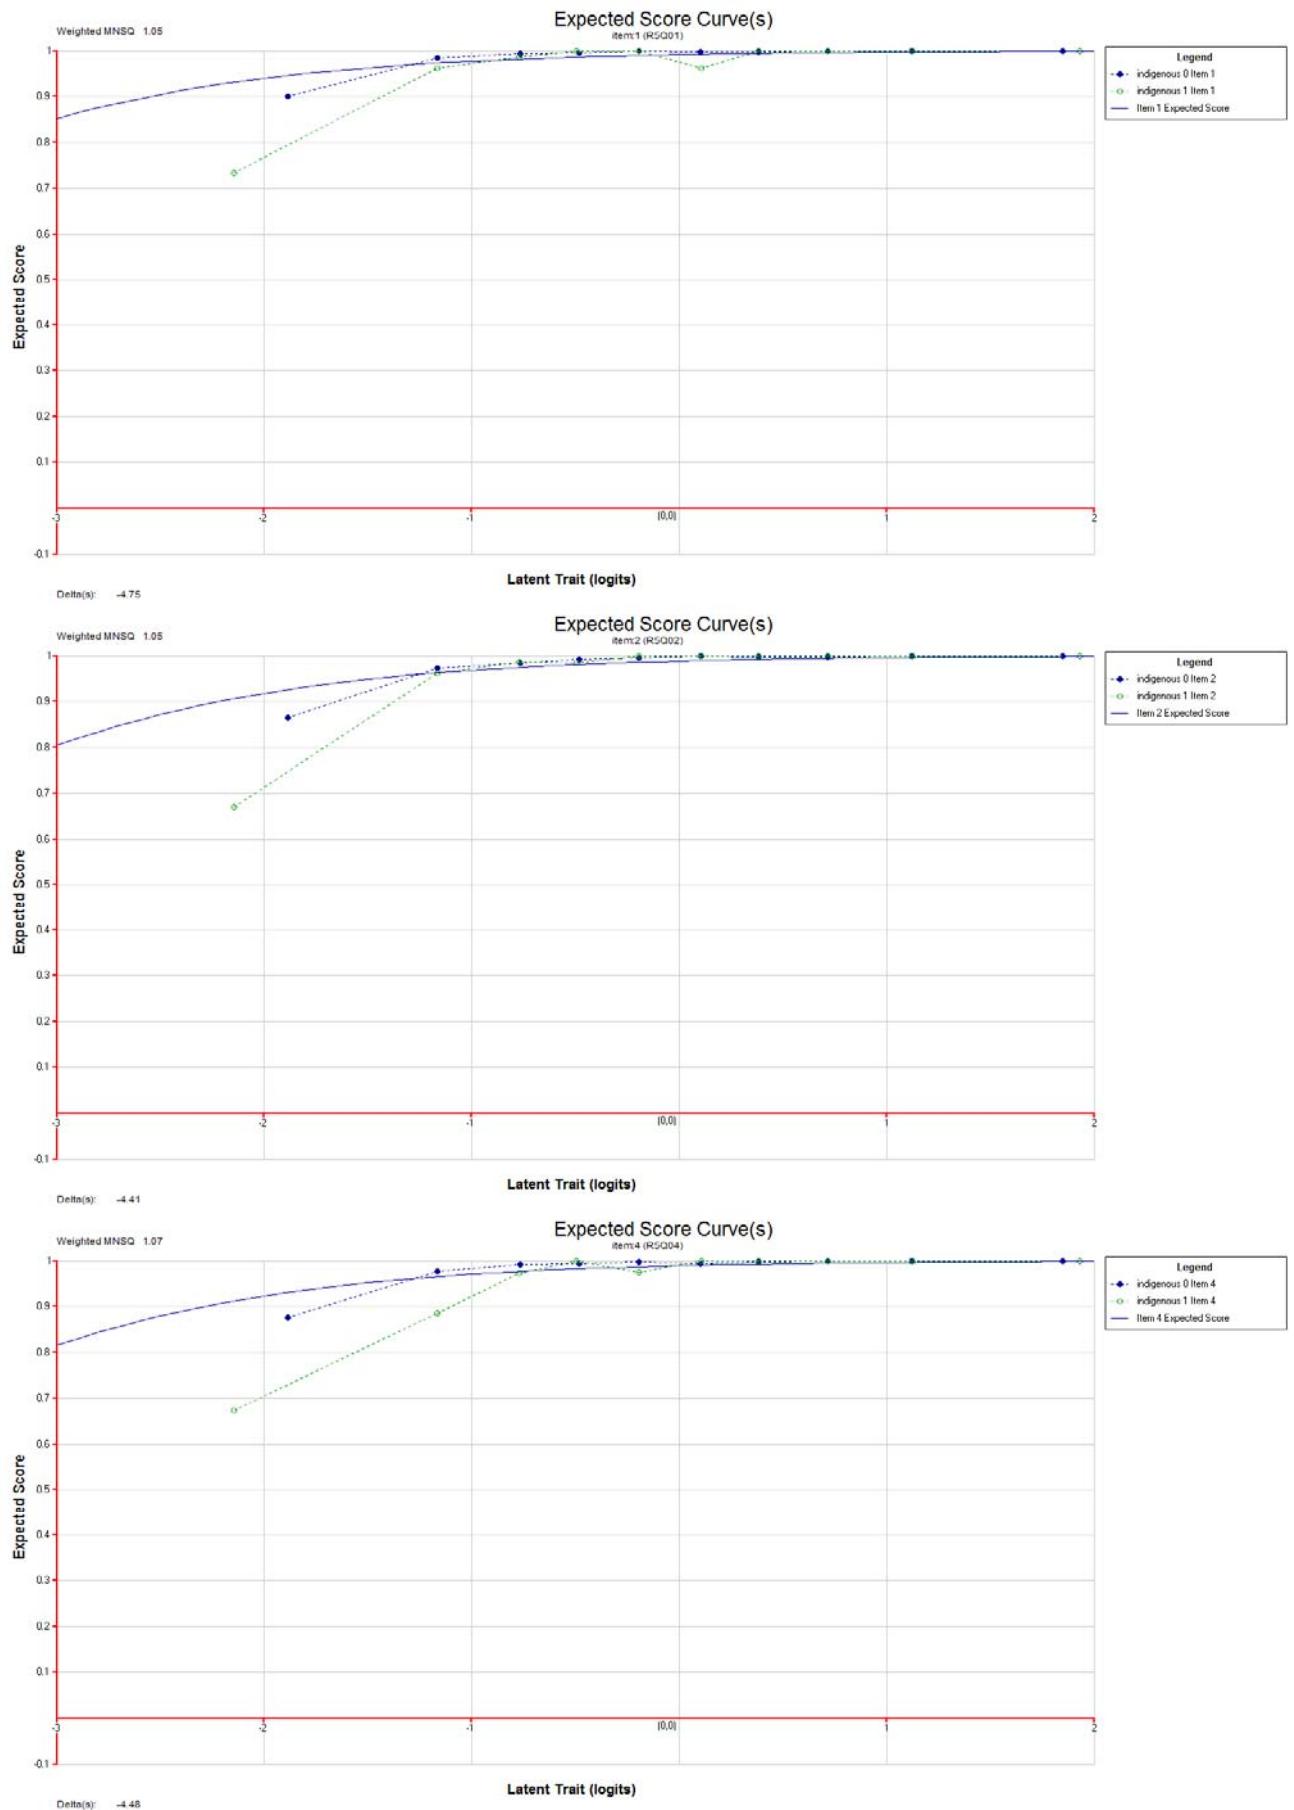

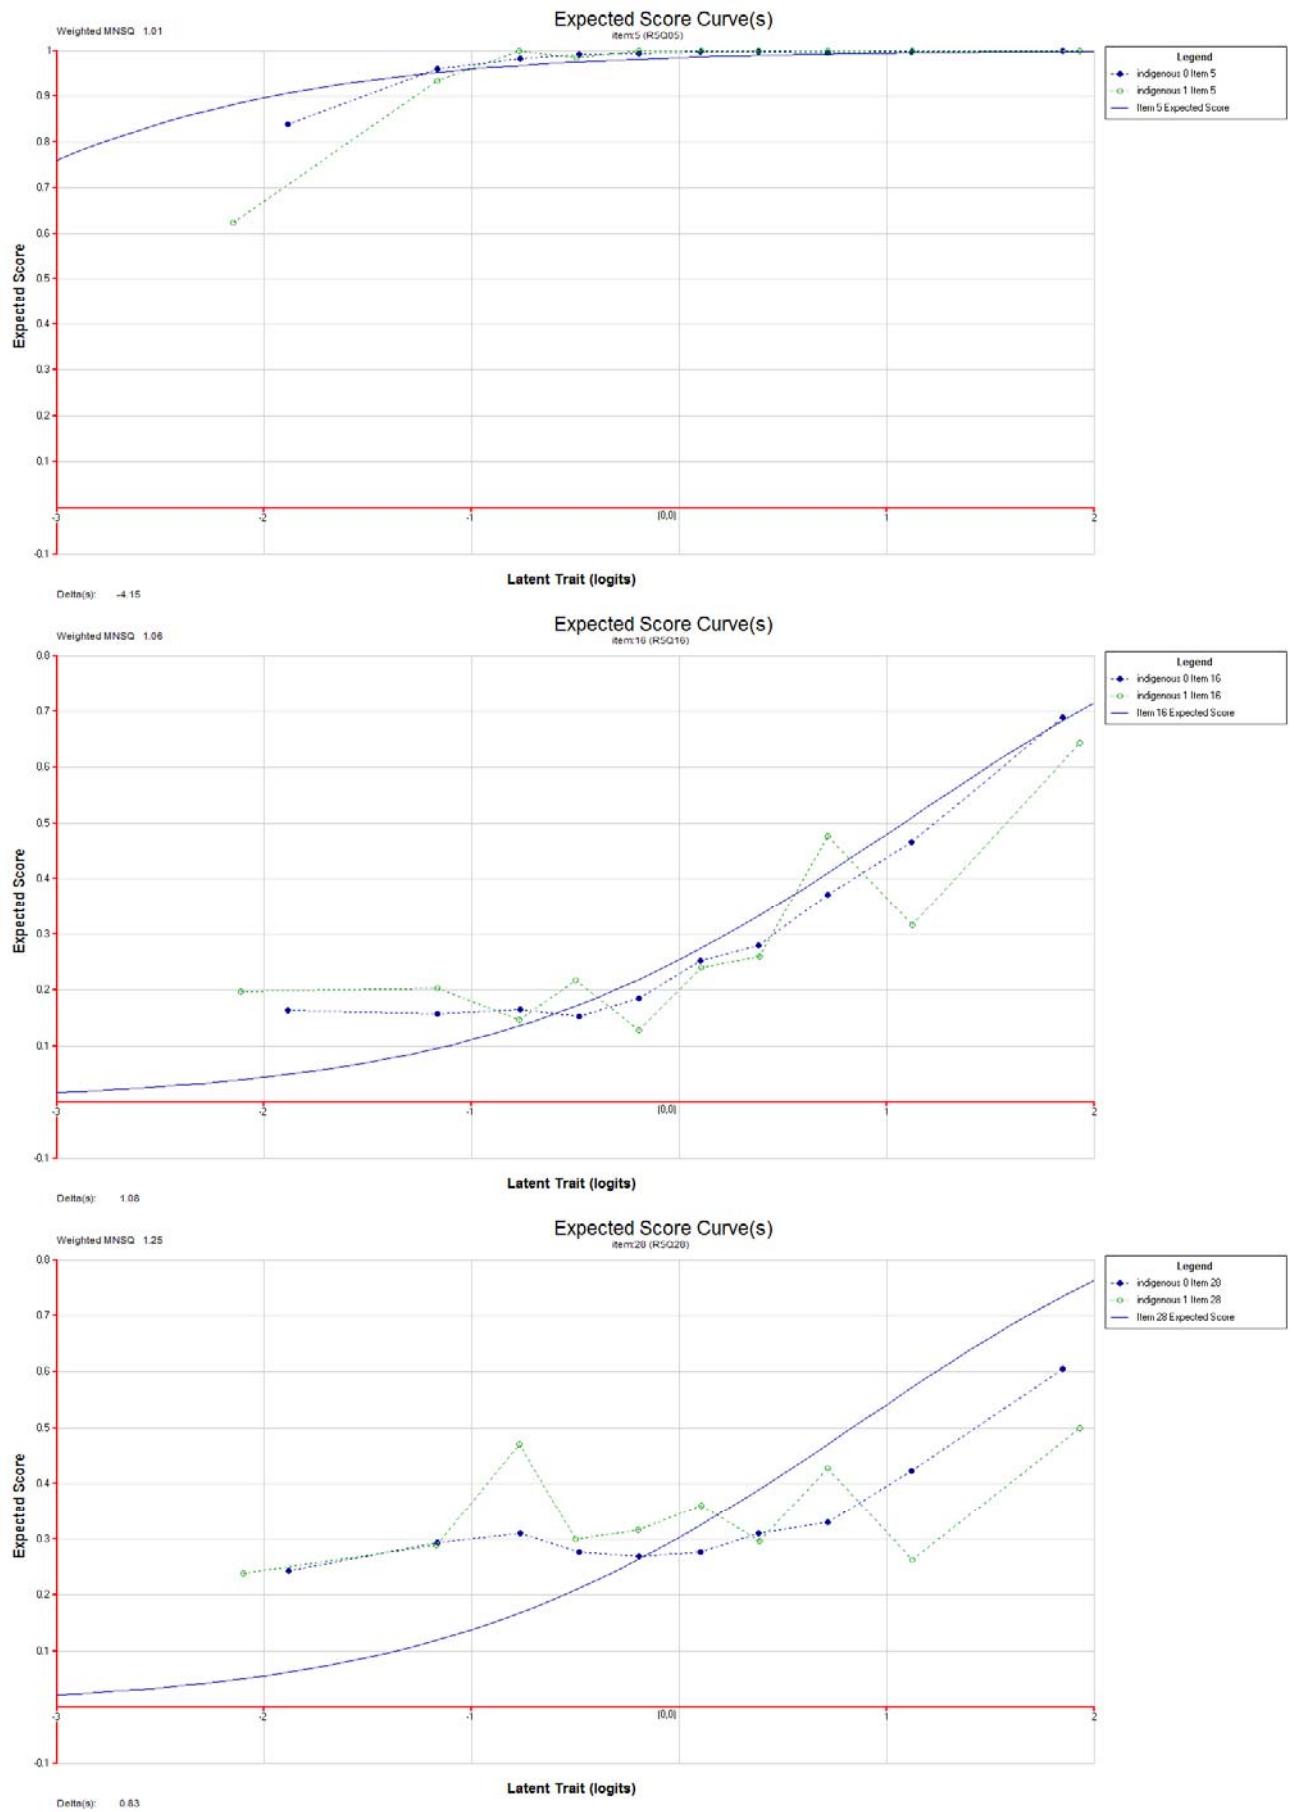

<sup>3</sup> 'indigenous 1' indicates 'Indigenous group' and 'indigenous 0' indicates 'Non-Indigenous group'.

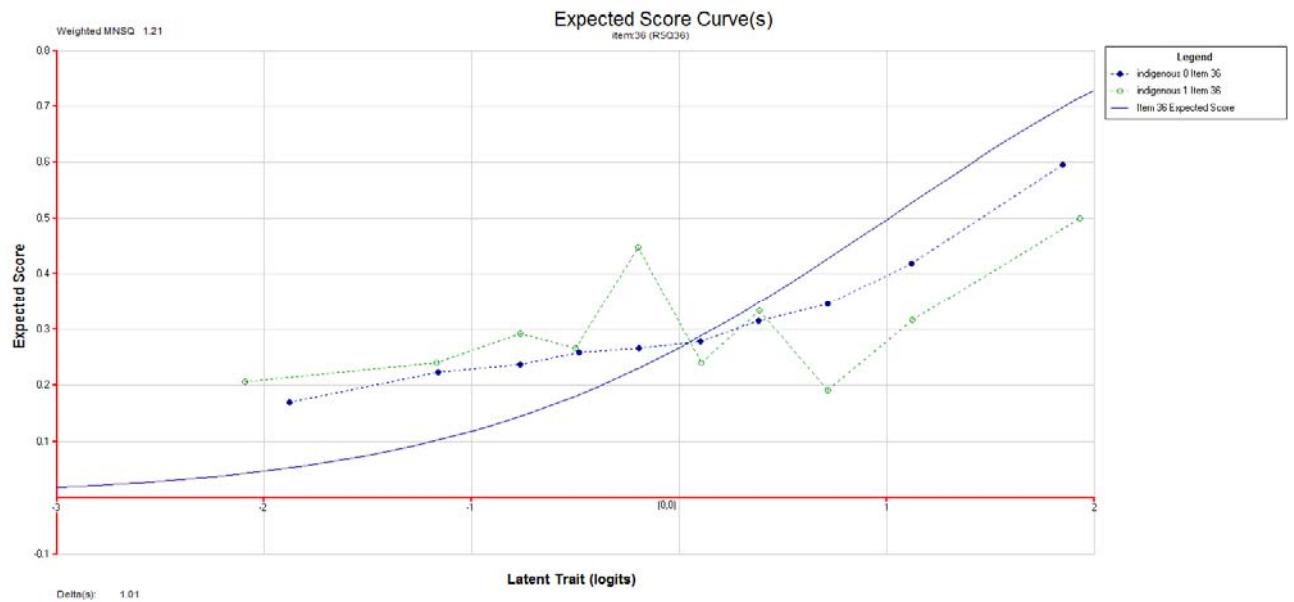

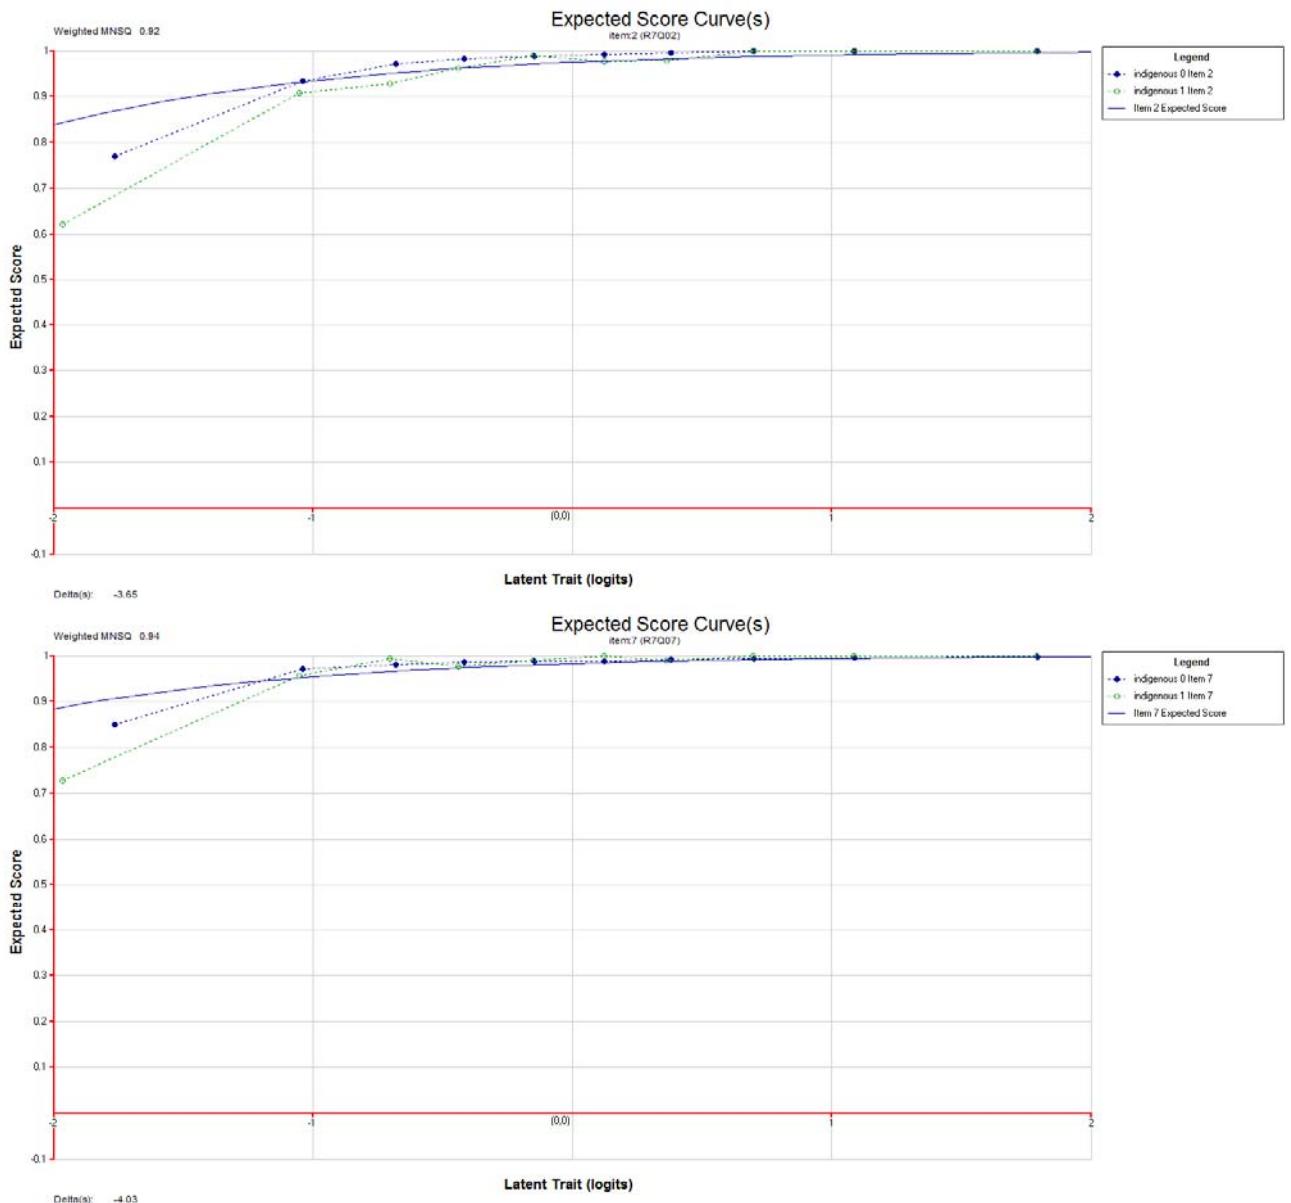

## H.6.2. Year 5 Reading

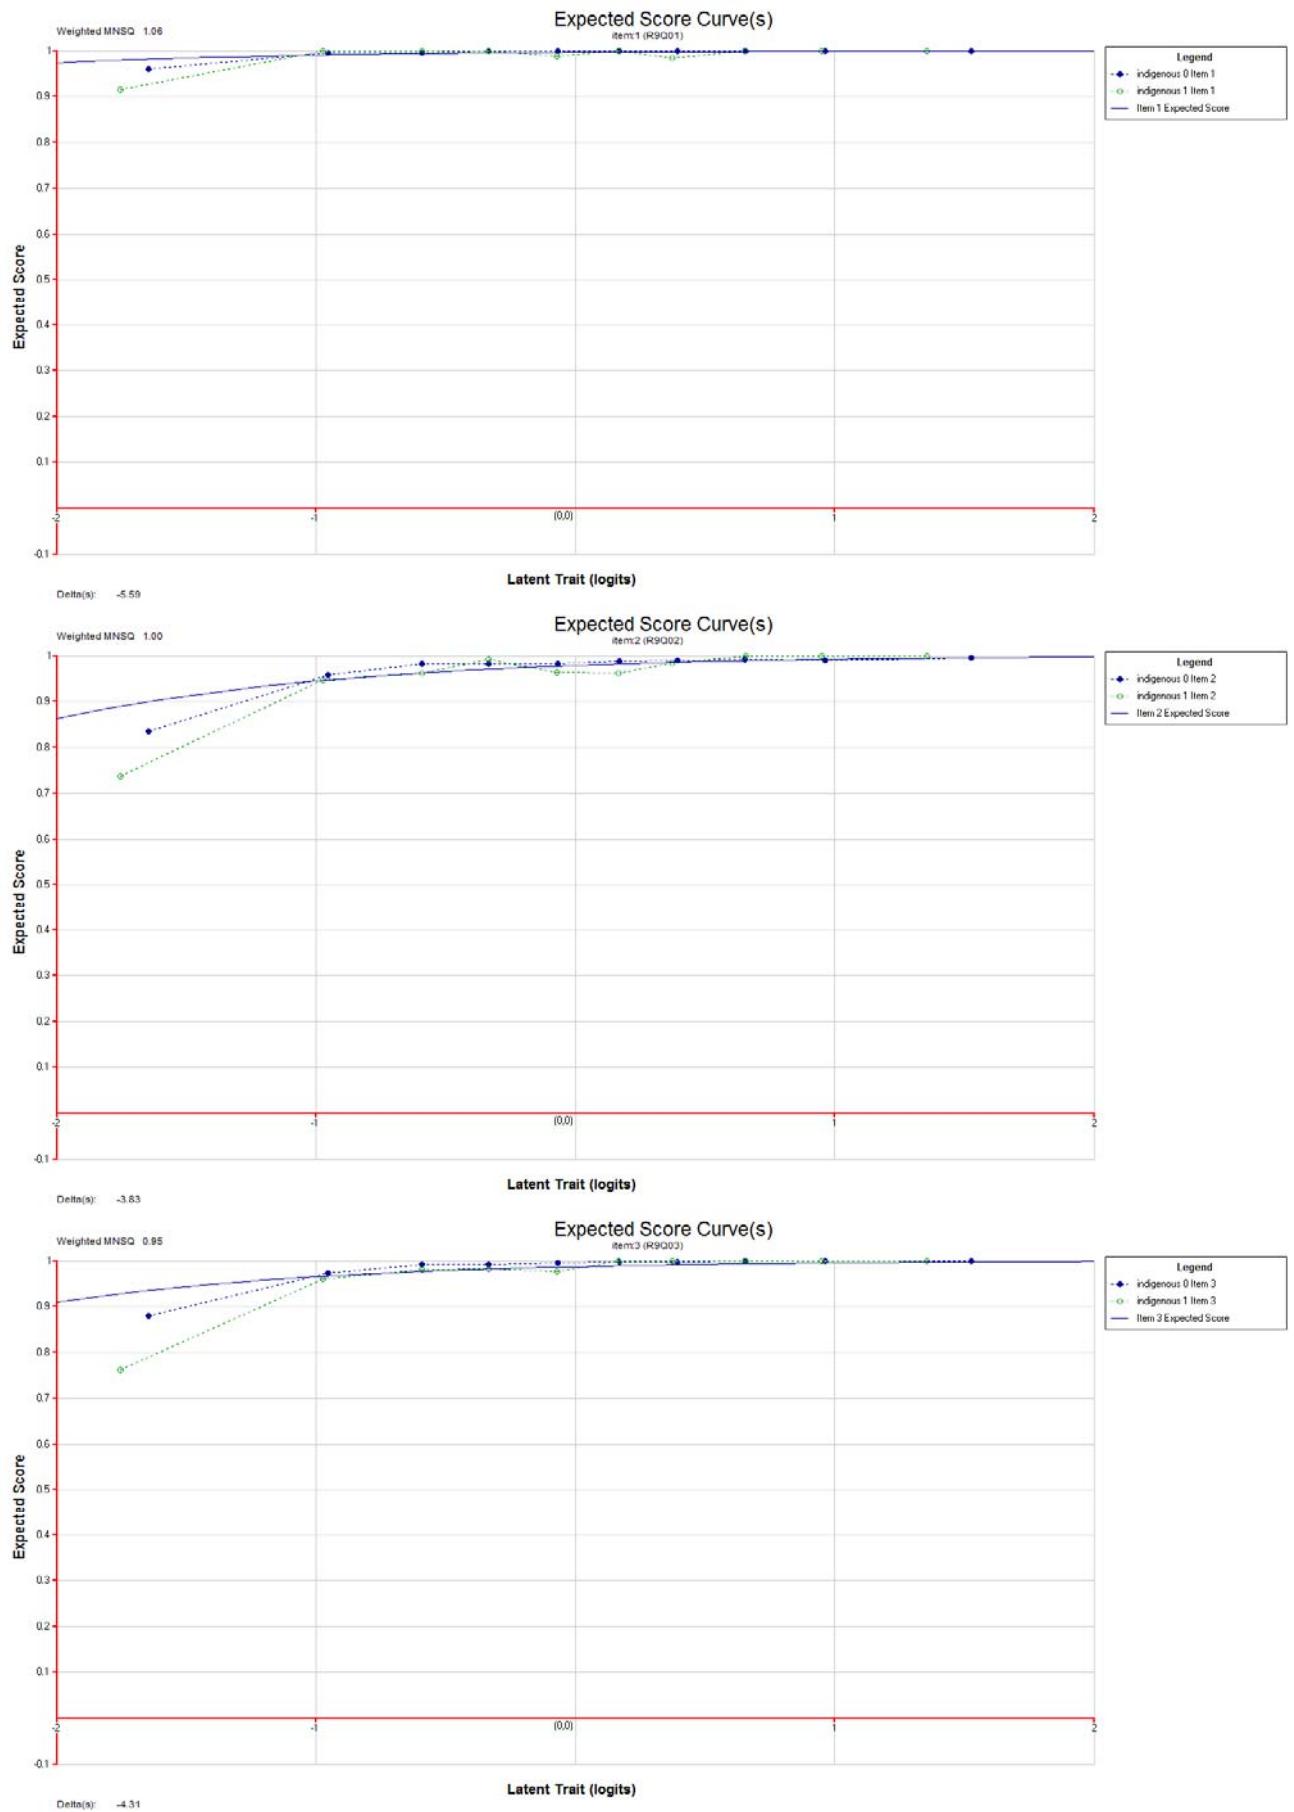

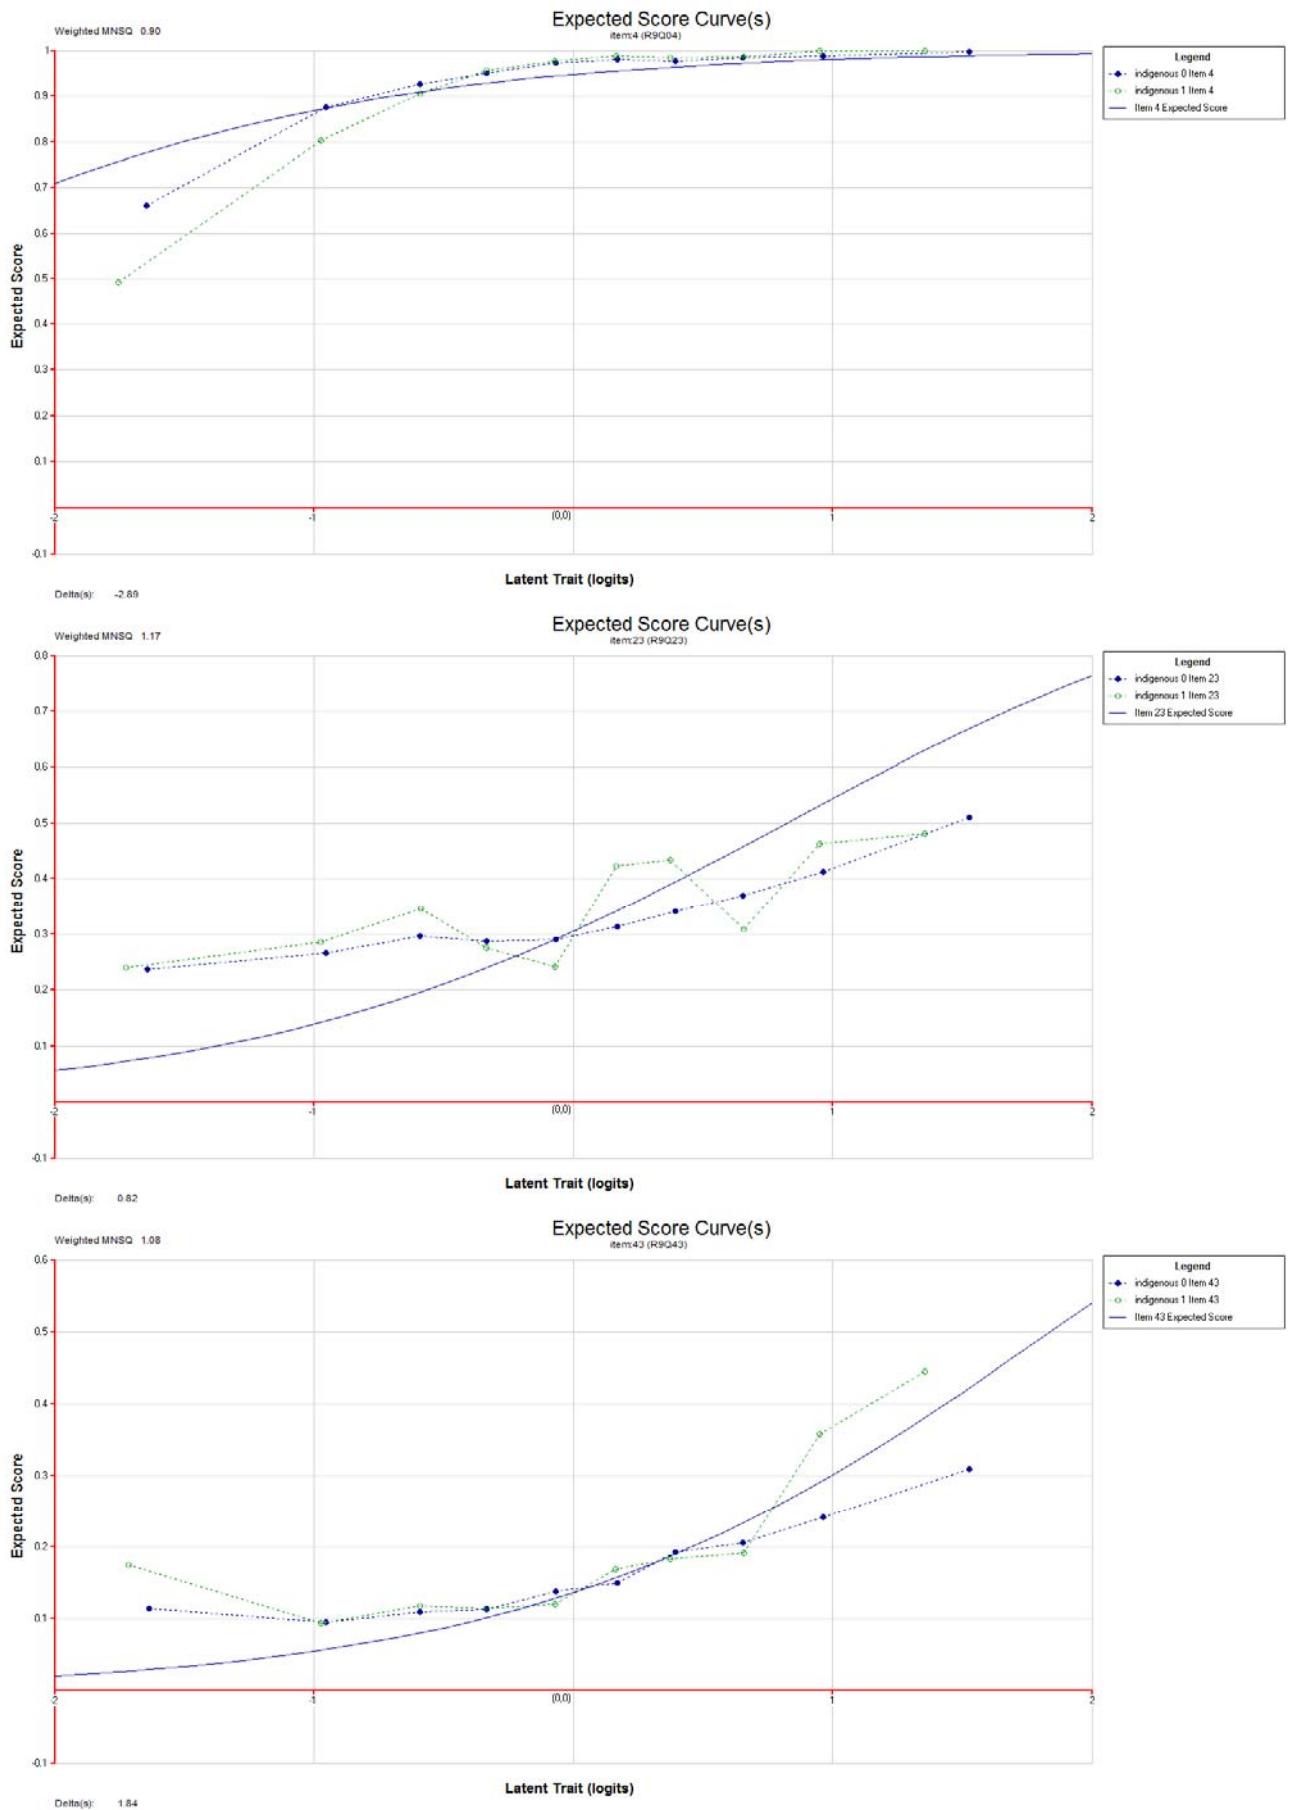

### H.6.3. Year 7 Reading

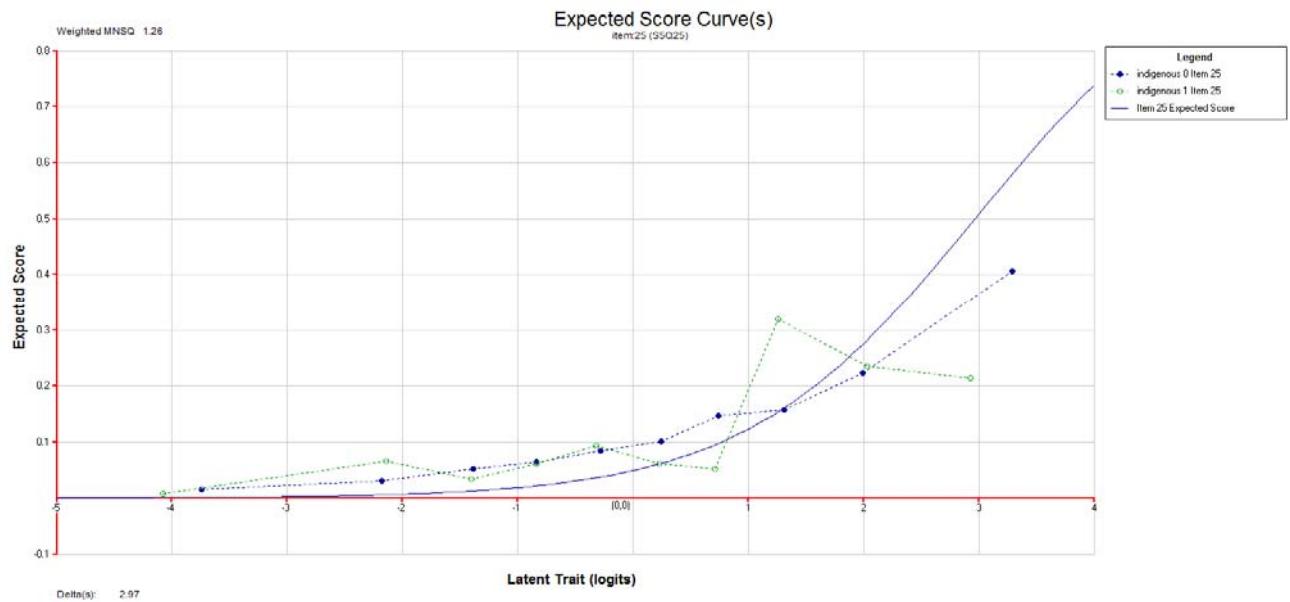

#### H.6.4. Year 9 Reading

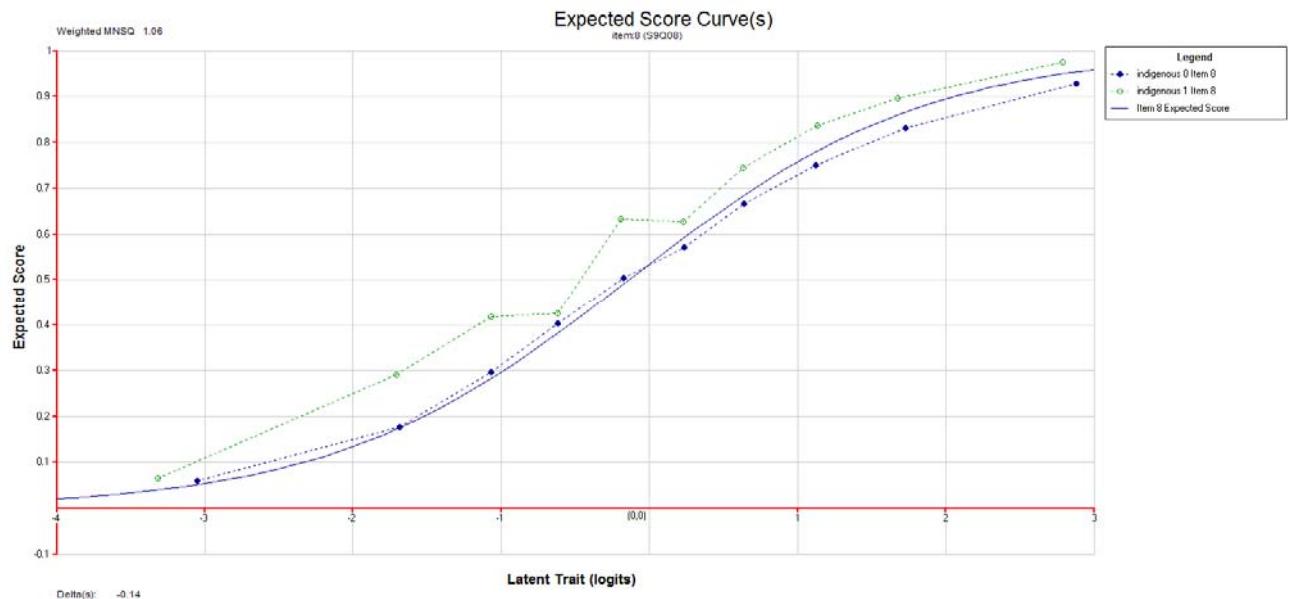

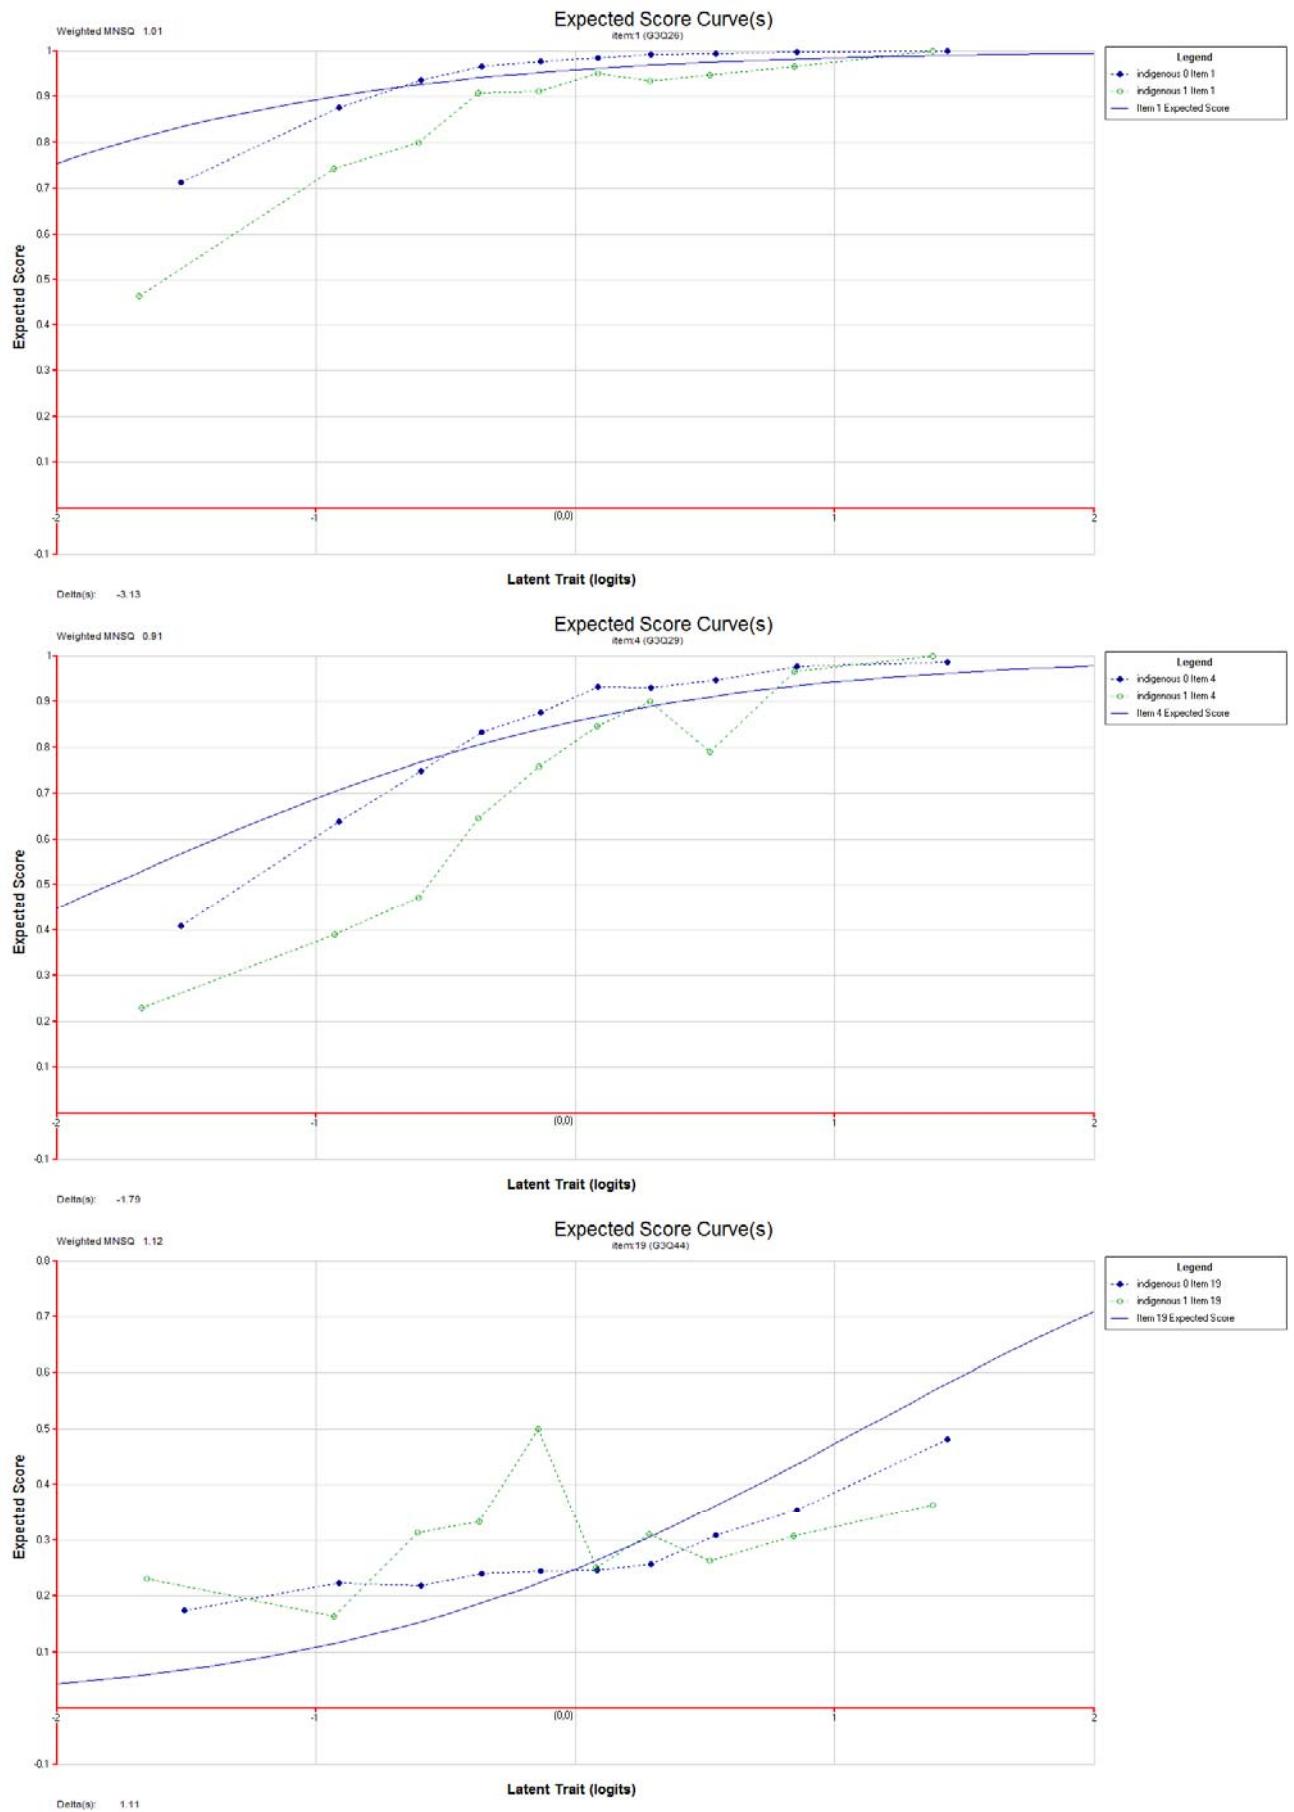

### H.6.5. Year 5 Spelling

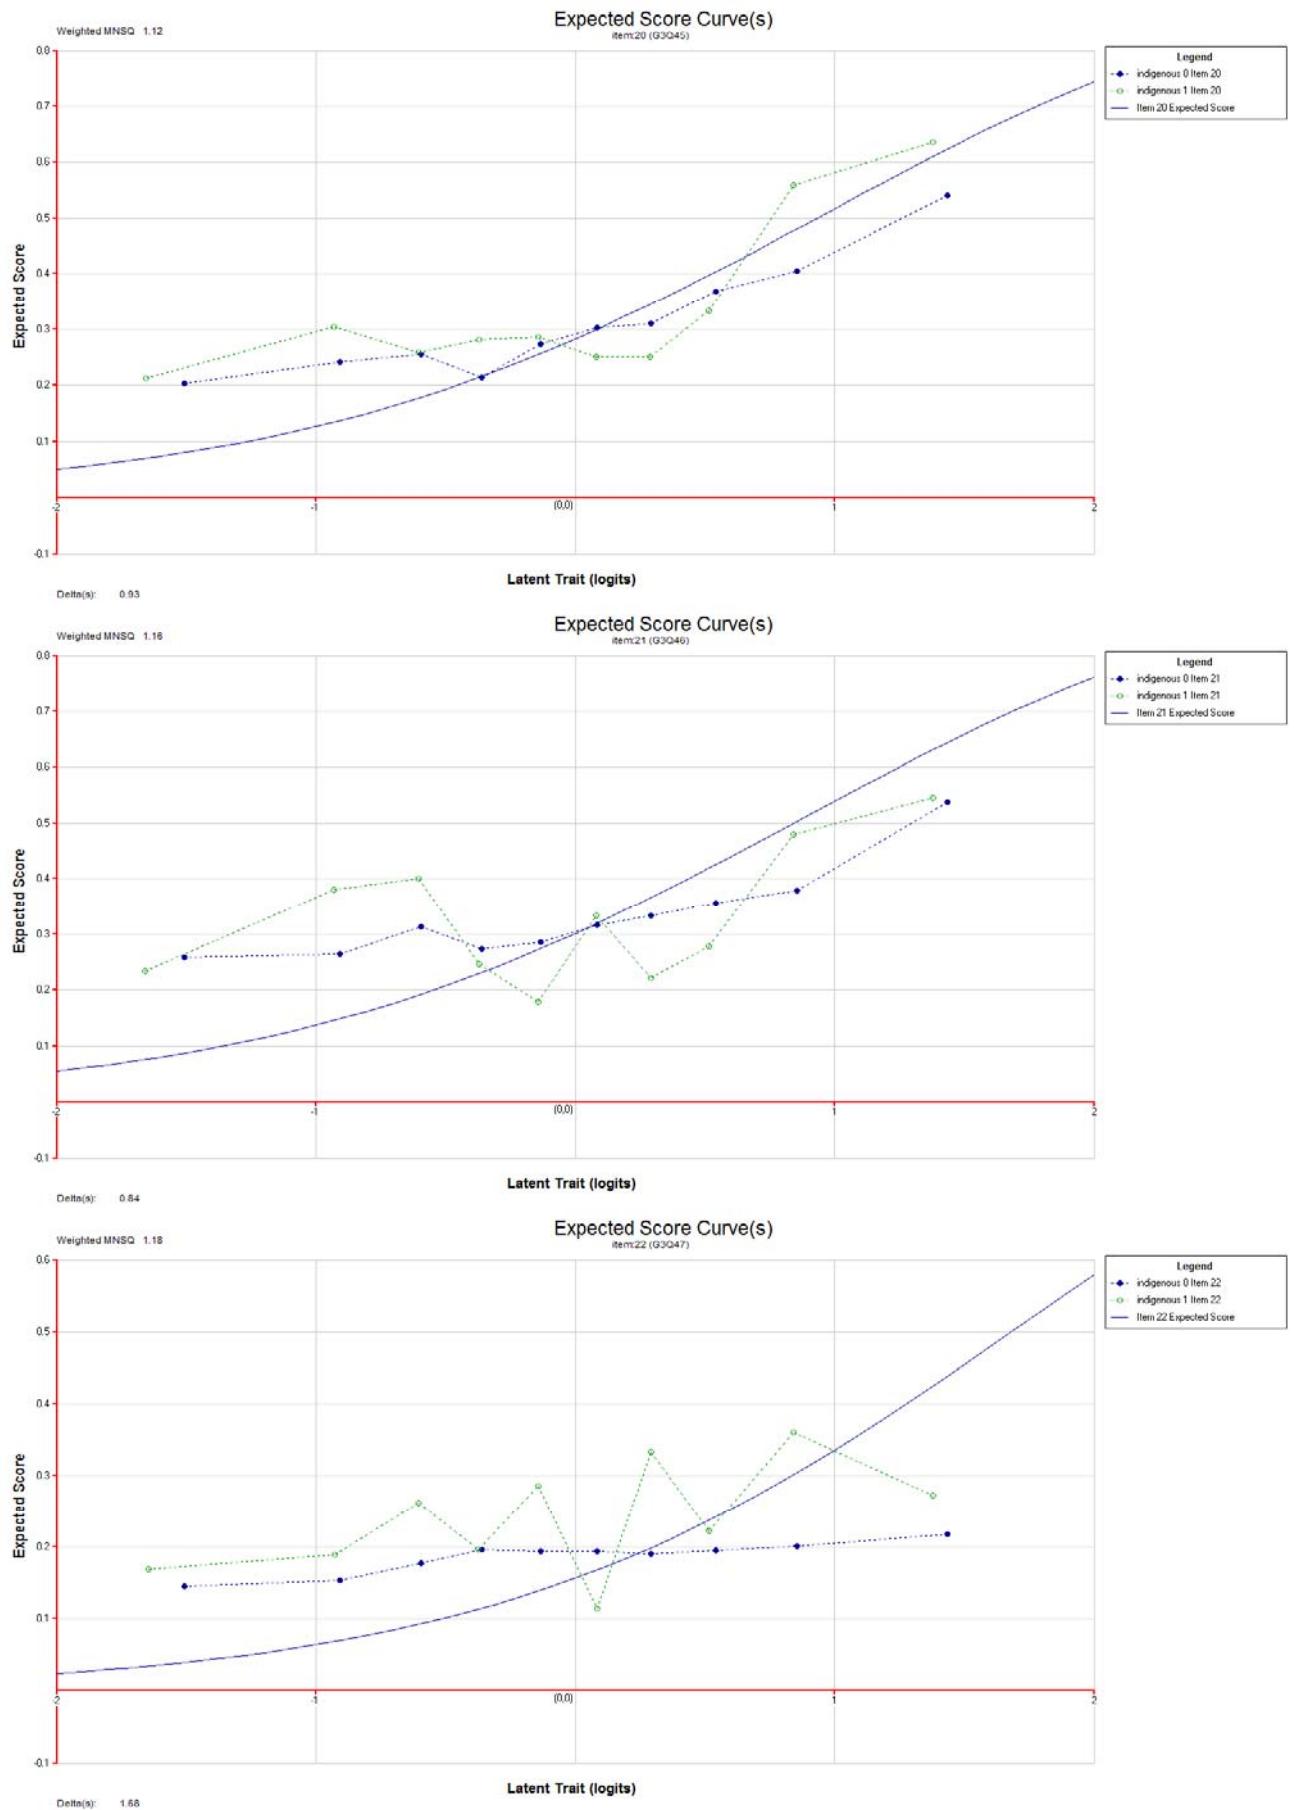

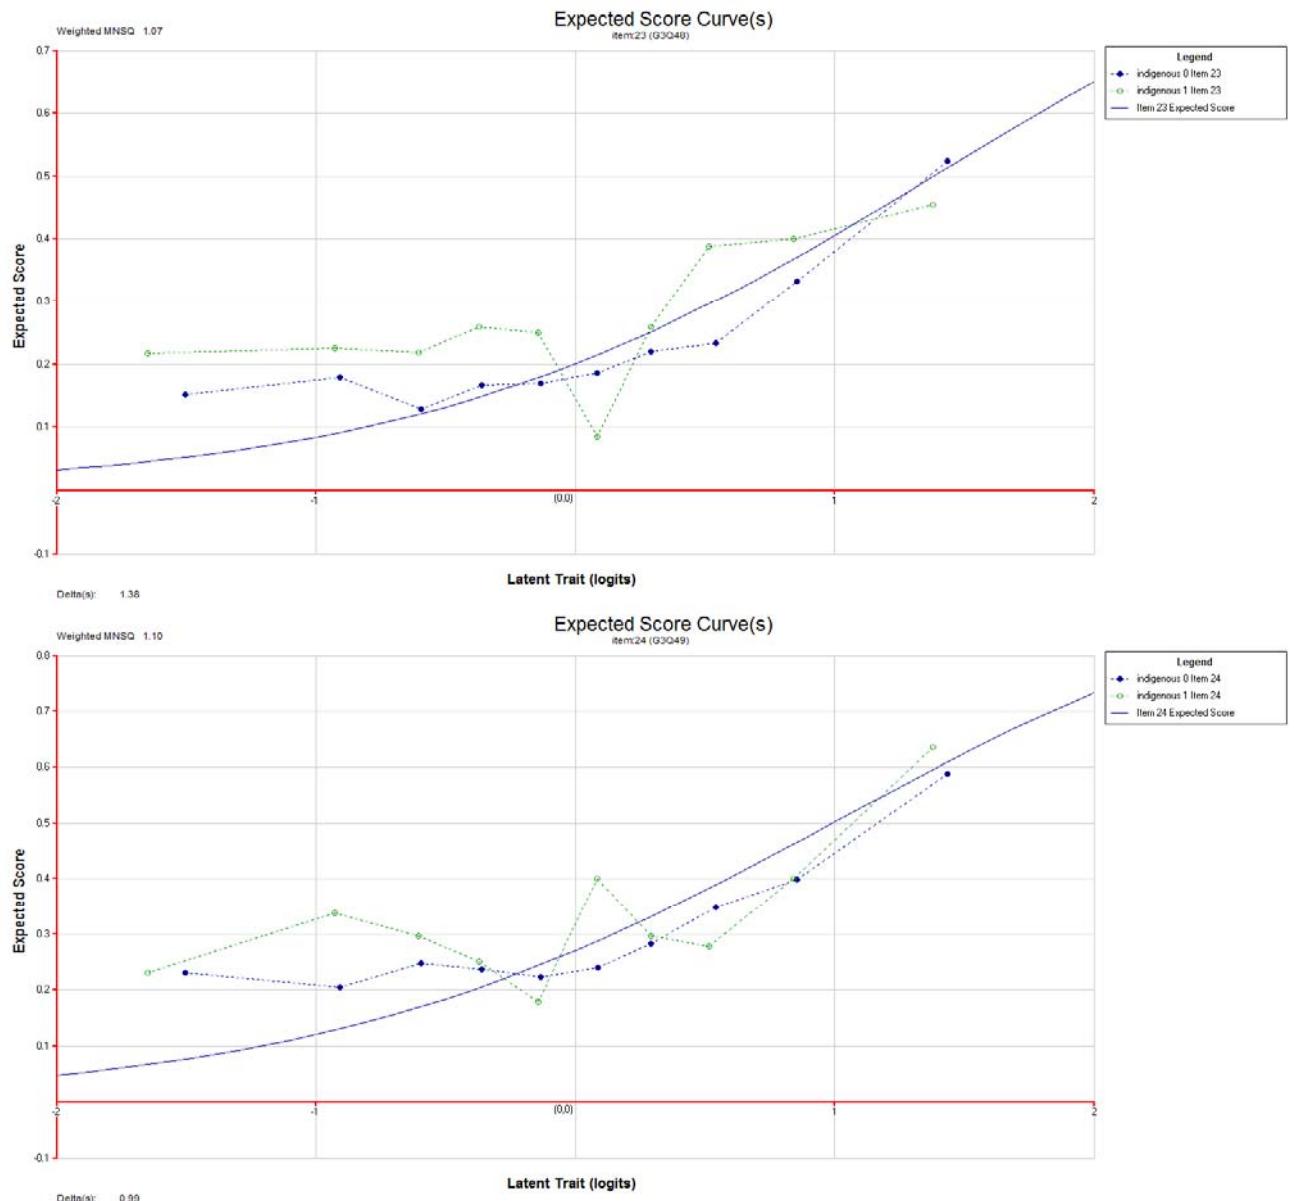

### H.6.6. Year 9 Spelling

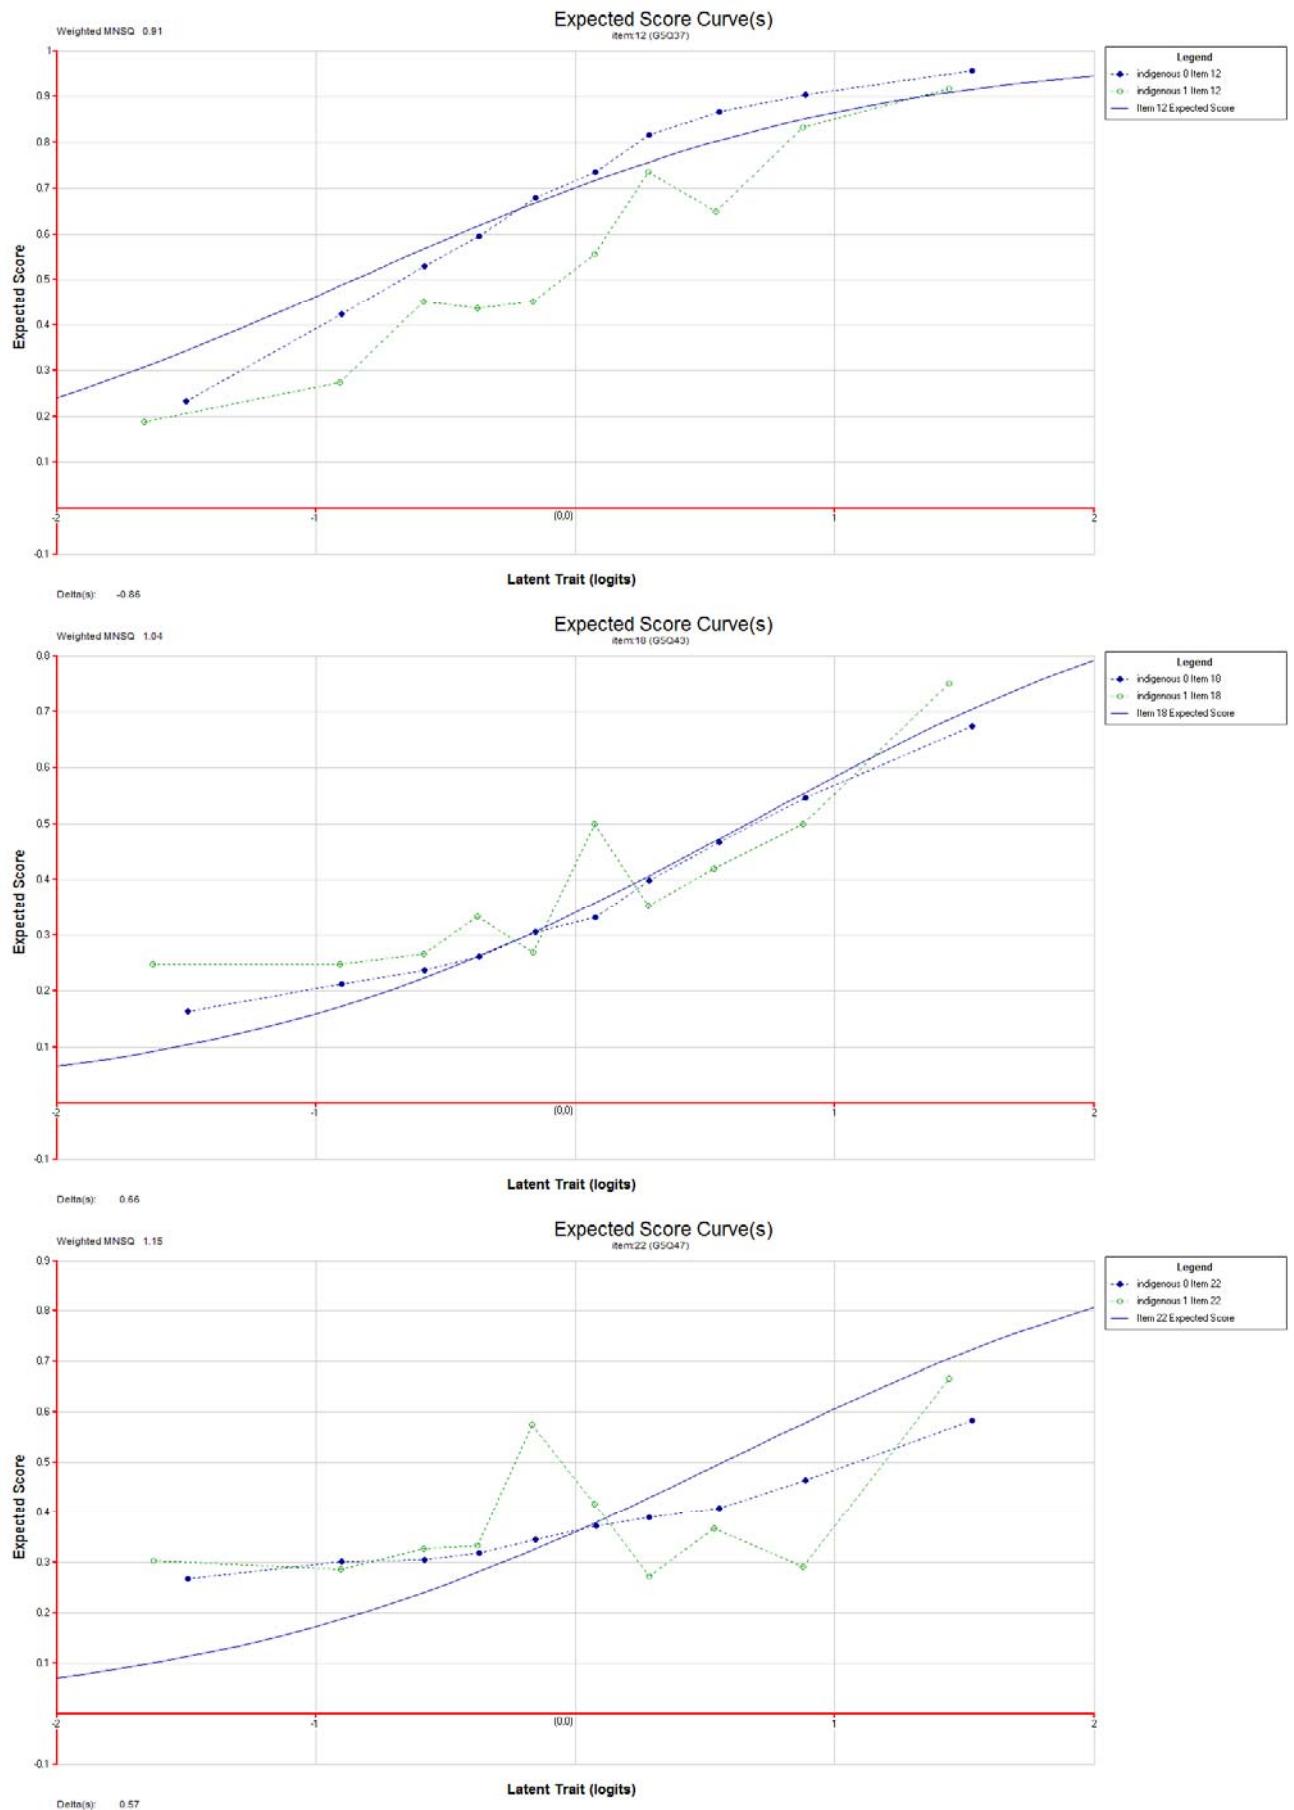

### H.6.7. Year 3 Grammar and Punctuation

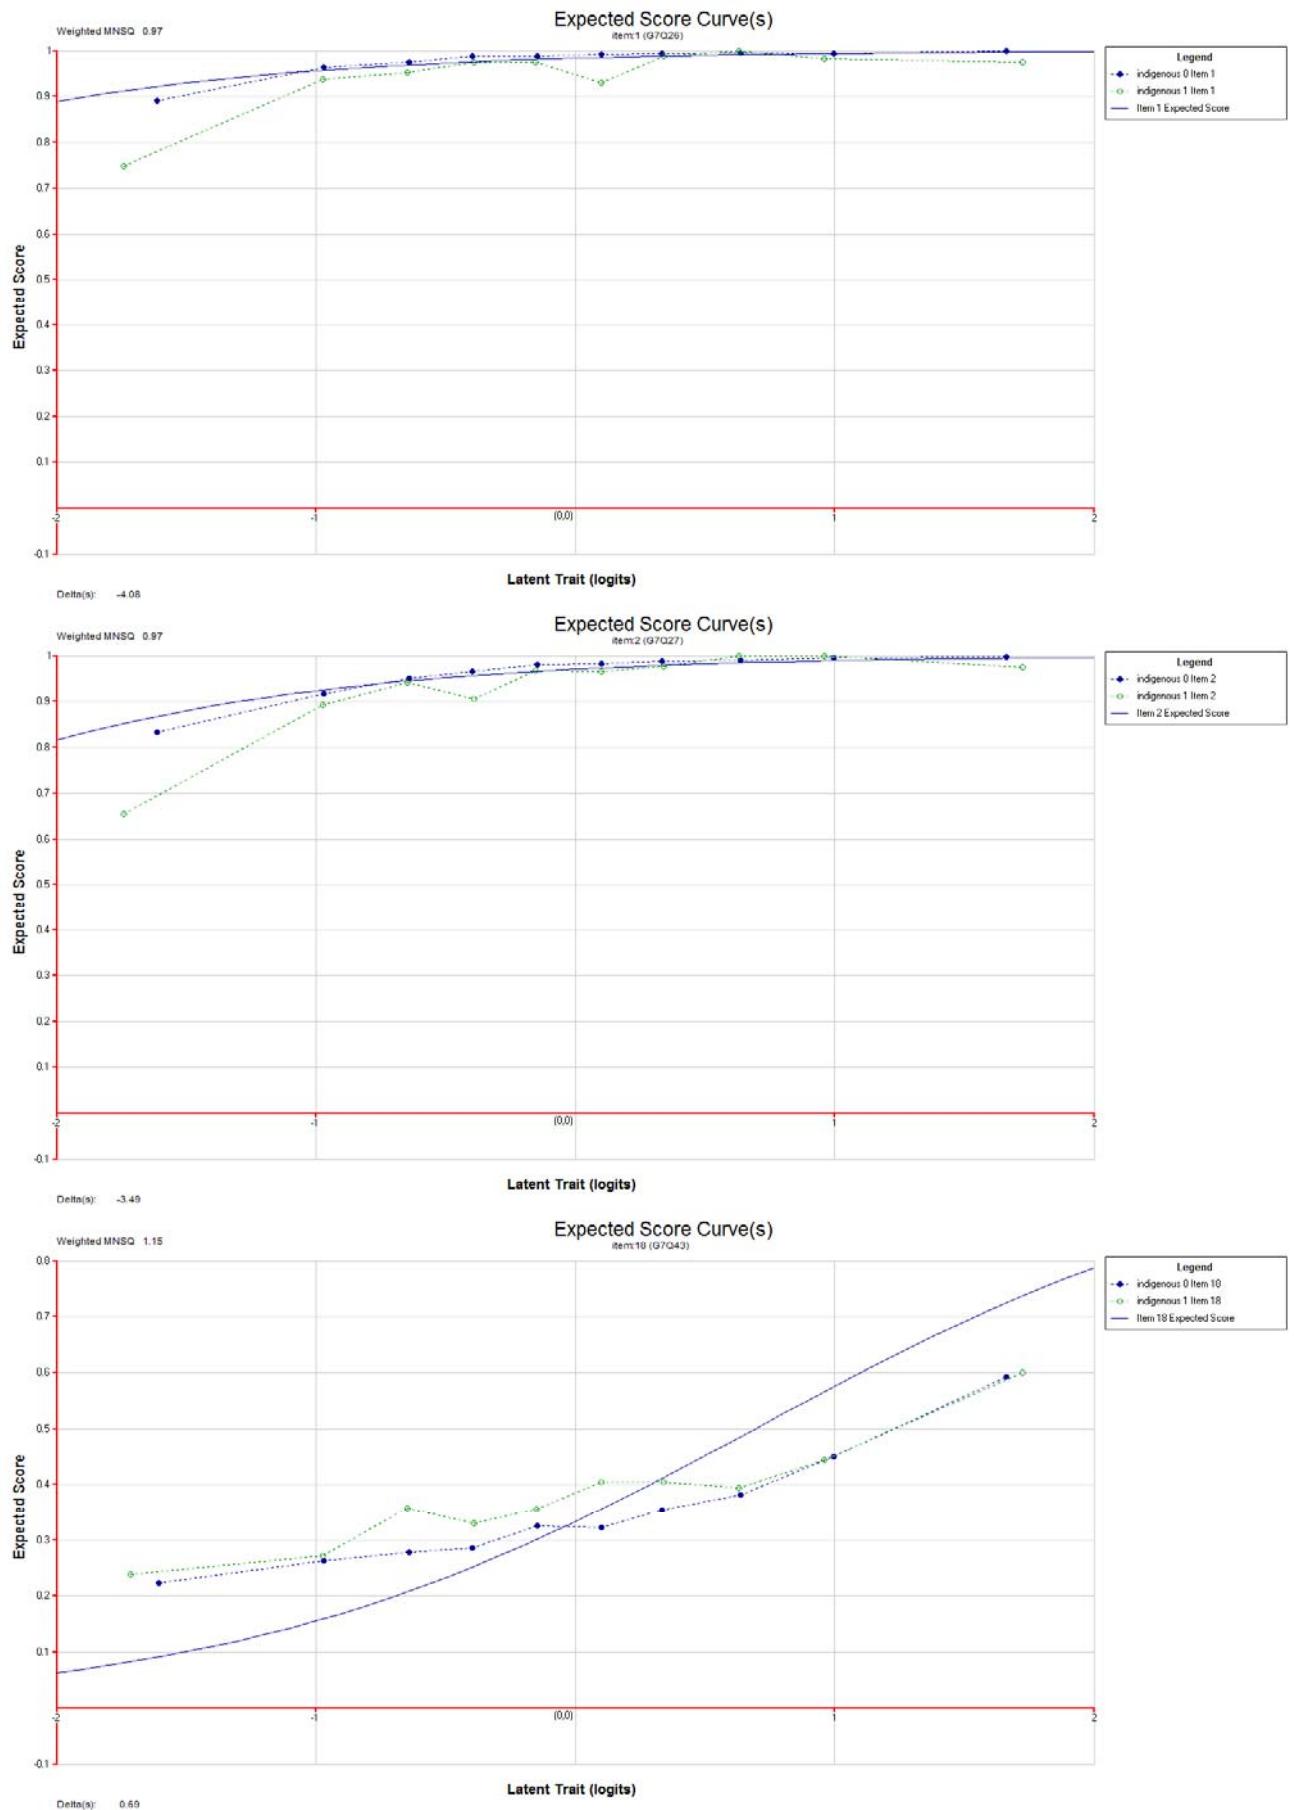

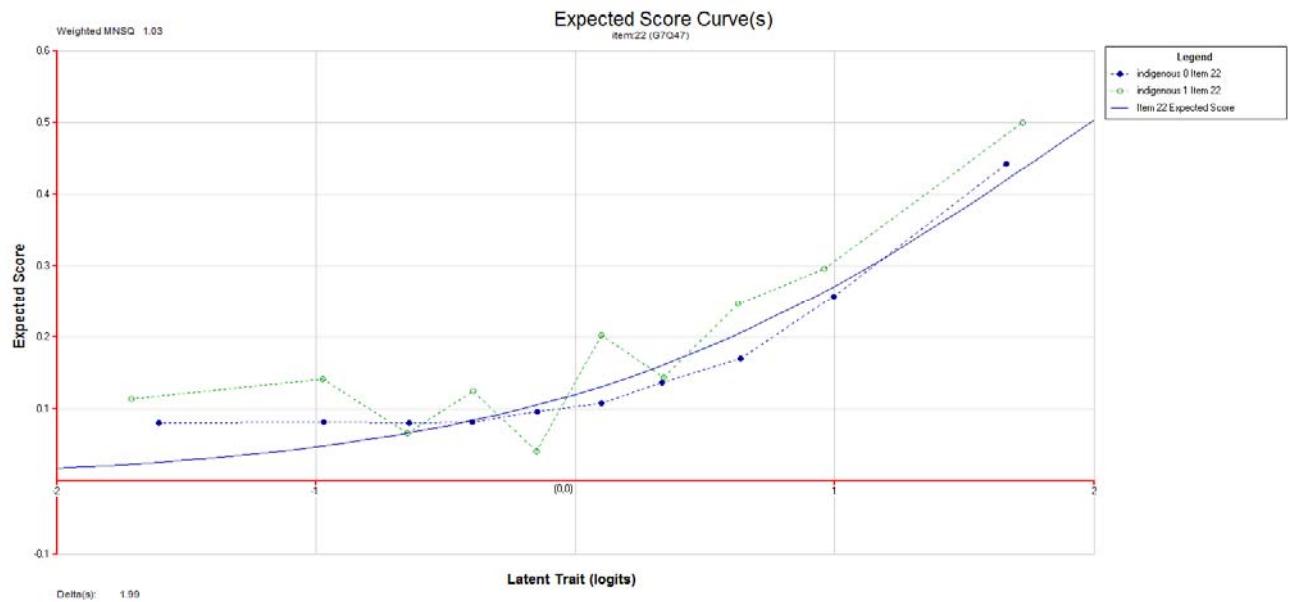

### H.6.8. Year 5 Grammar and Punctuation

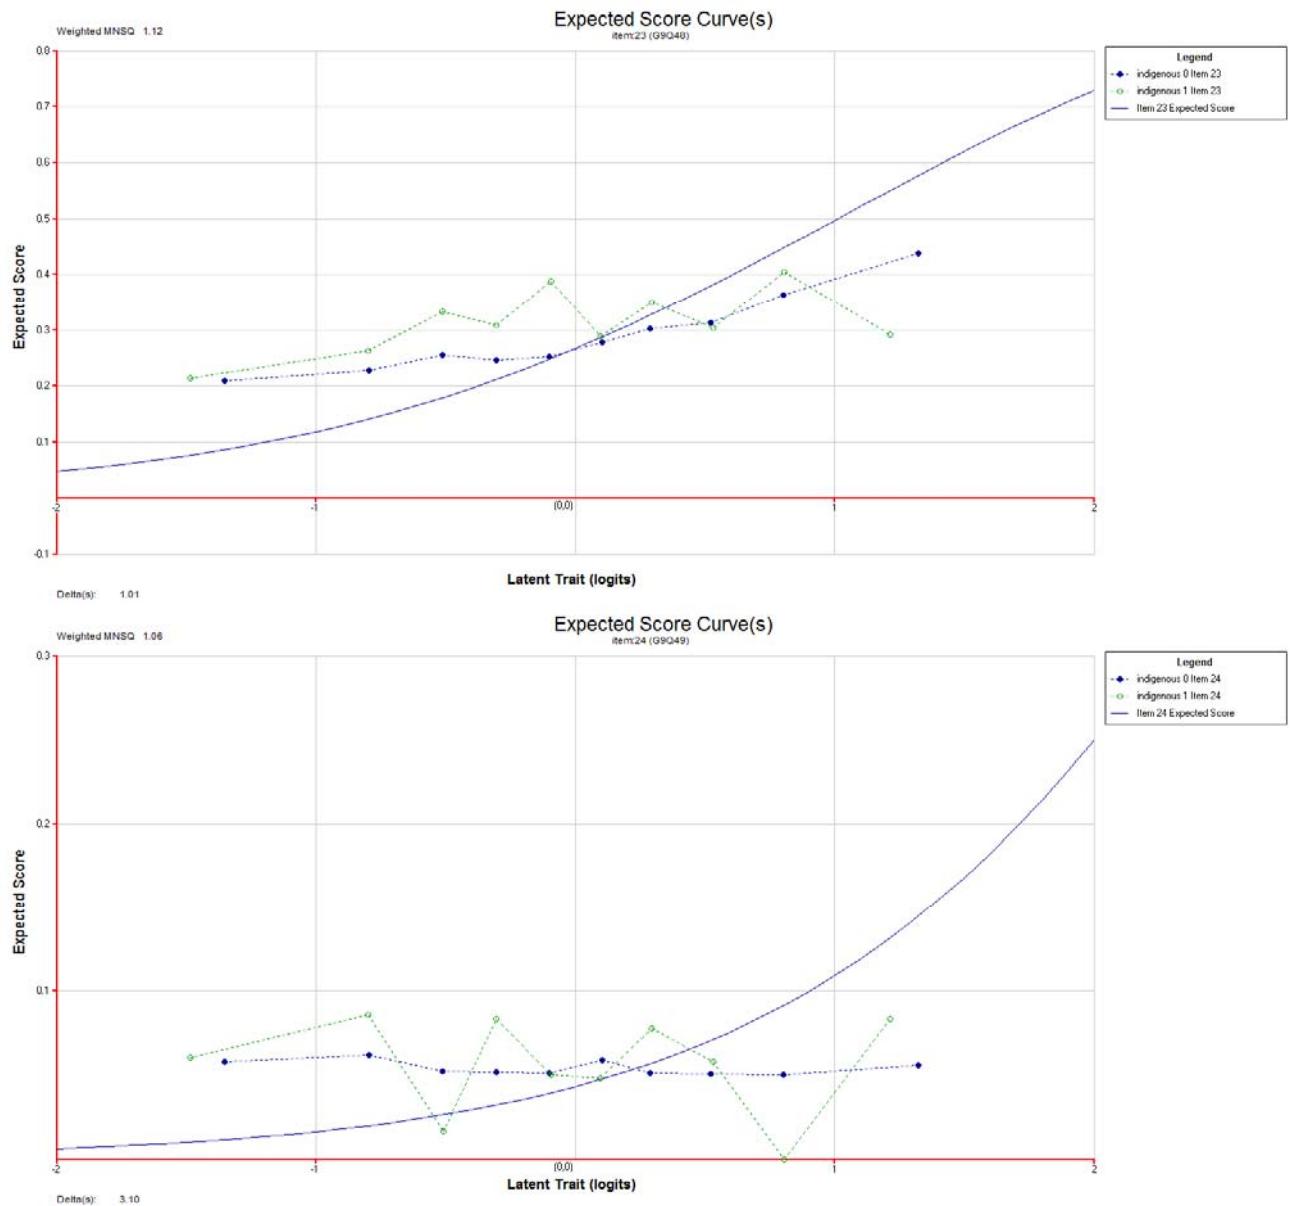

### H.6.9. Year 7 Grammar and Punctuation

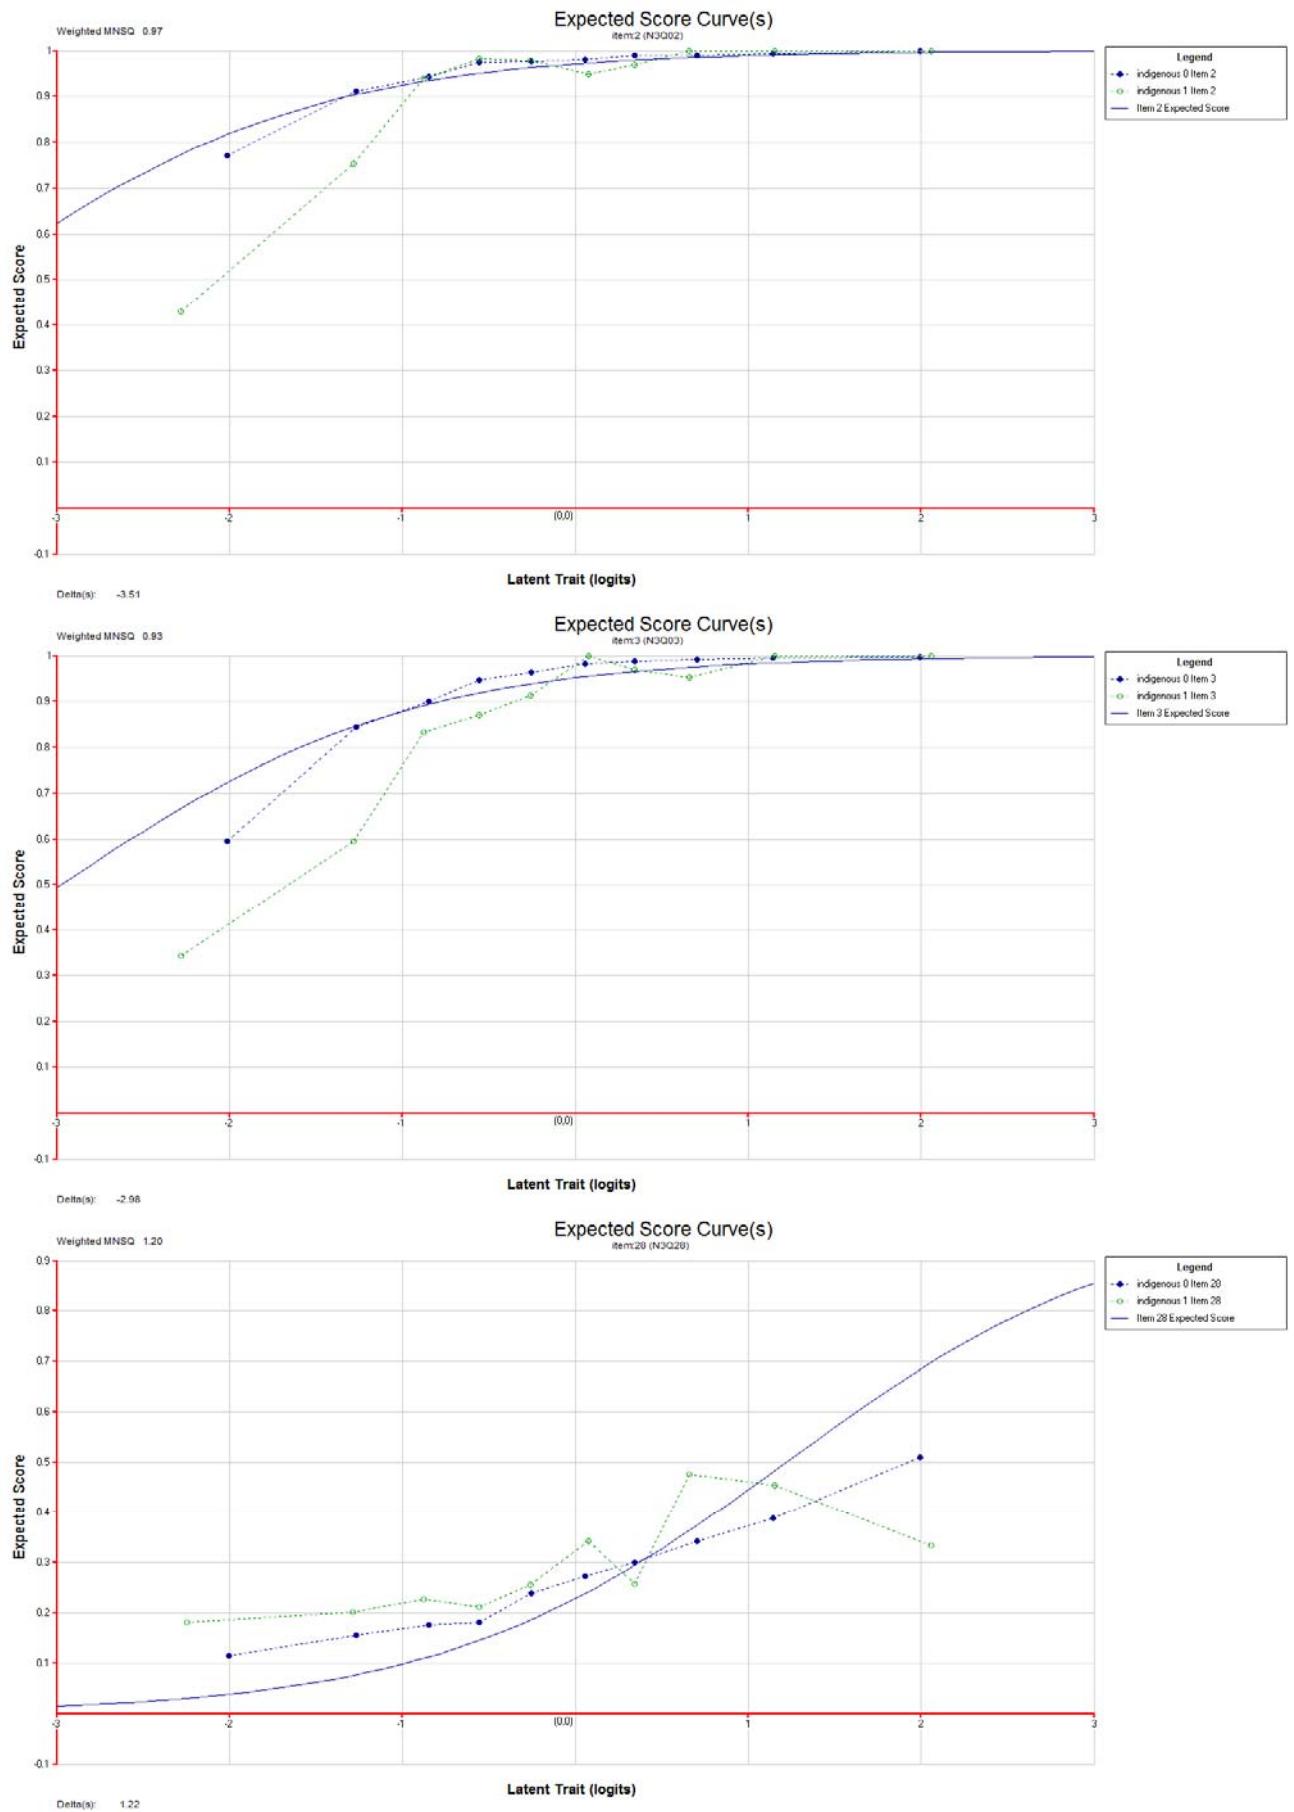

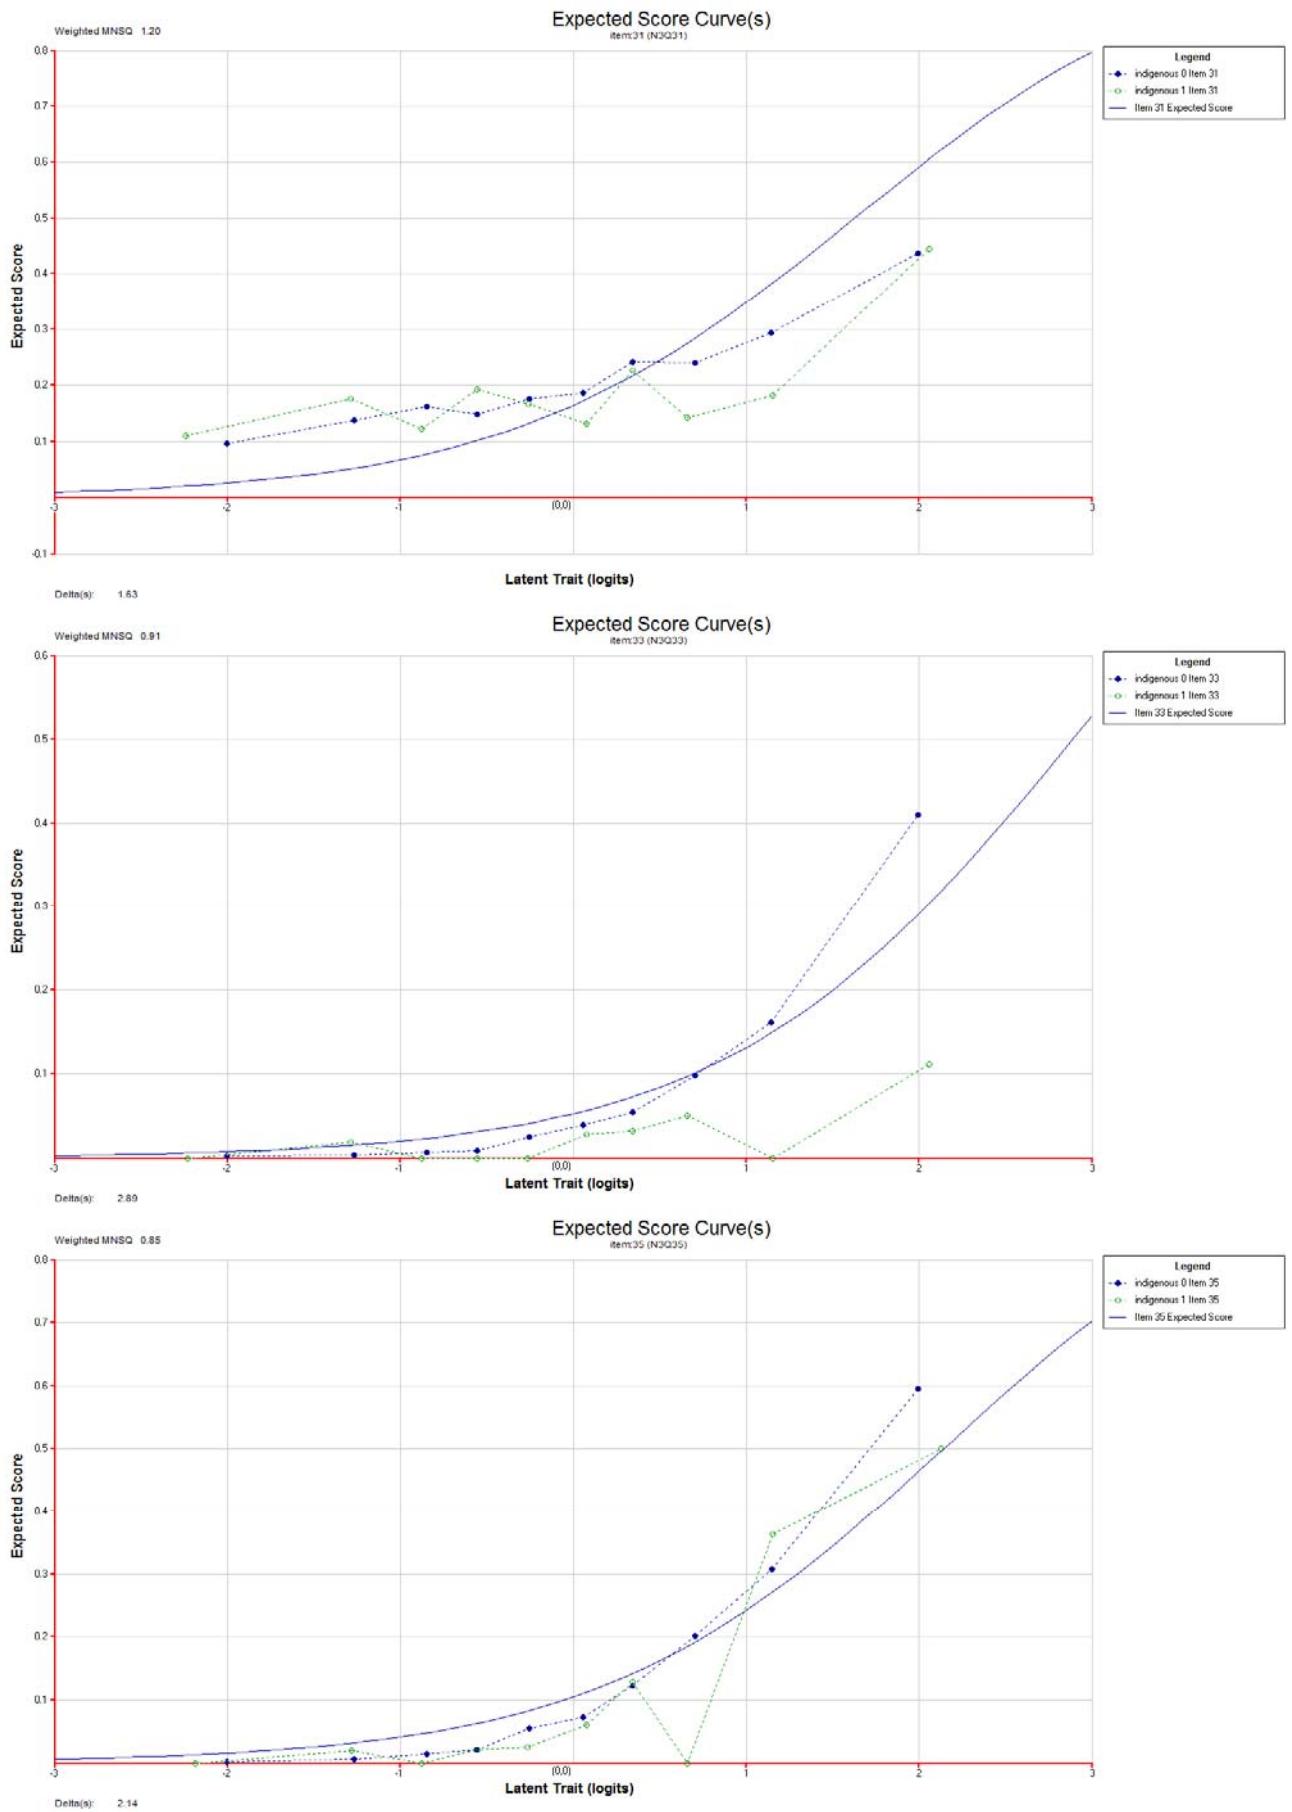

### H.6.10. Year 9 Grammar and Punctuation

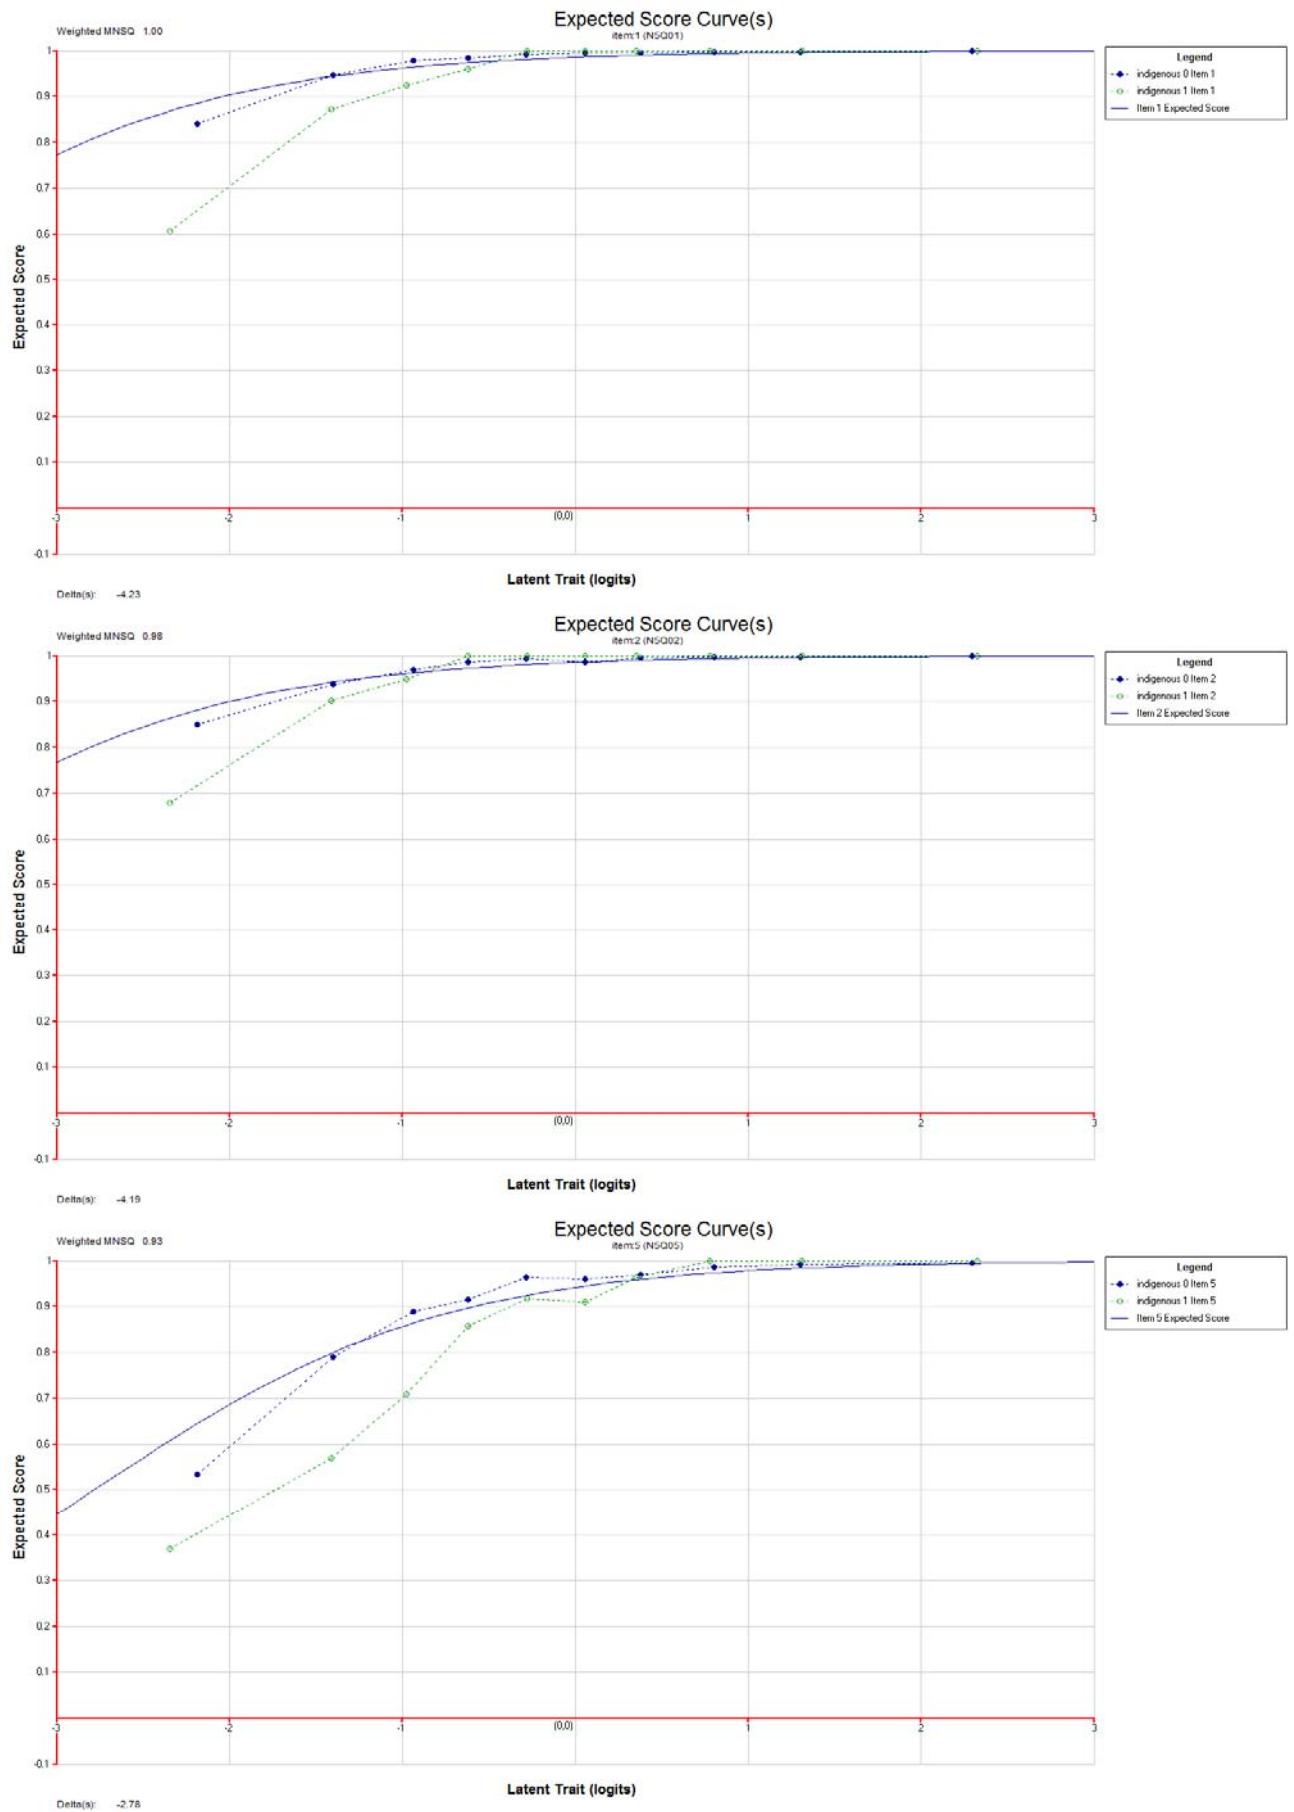

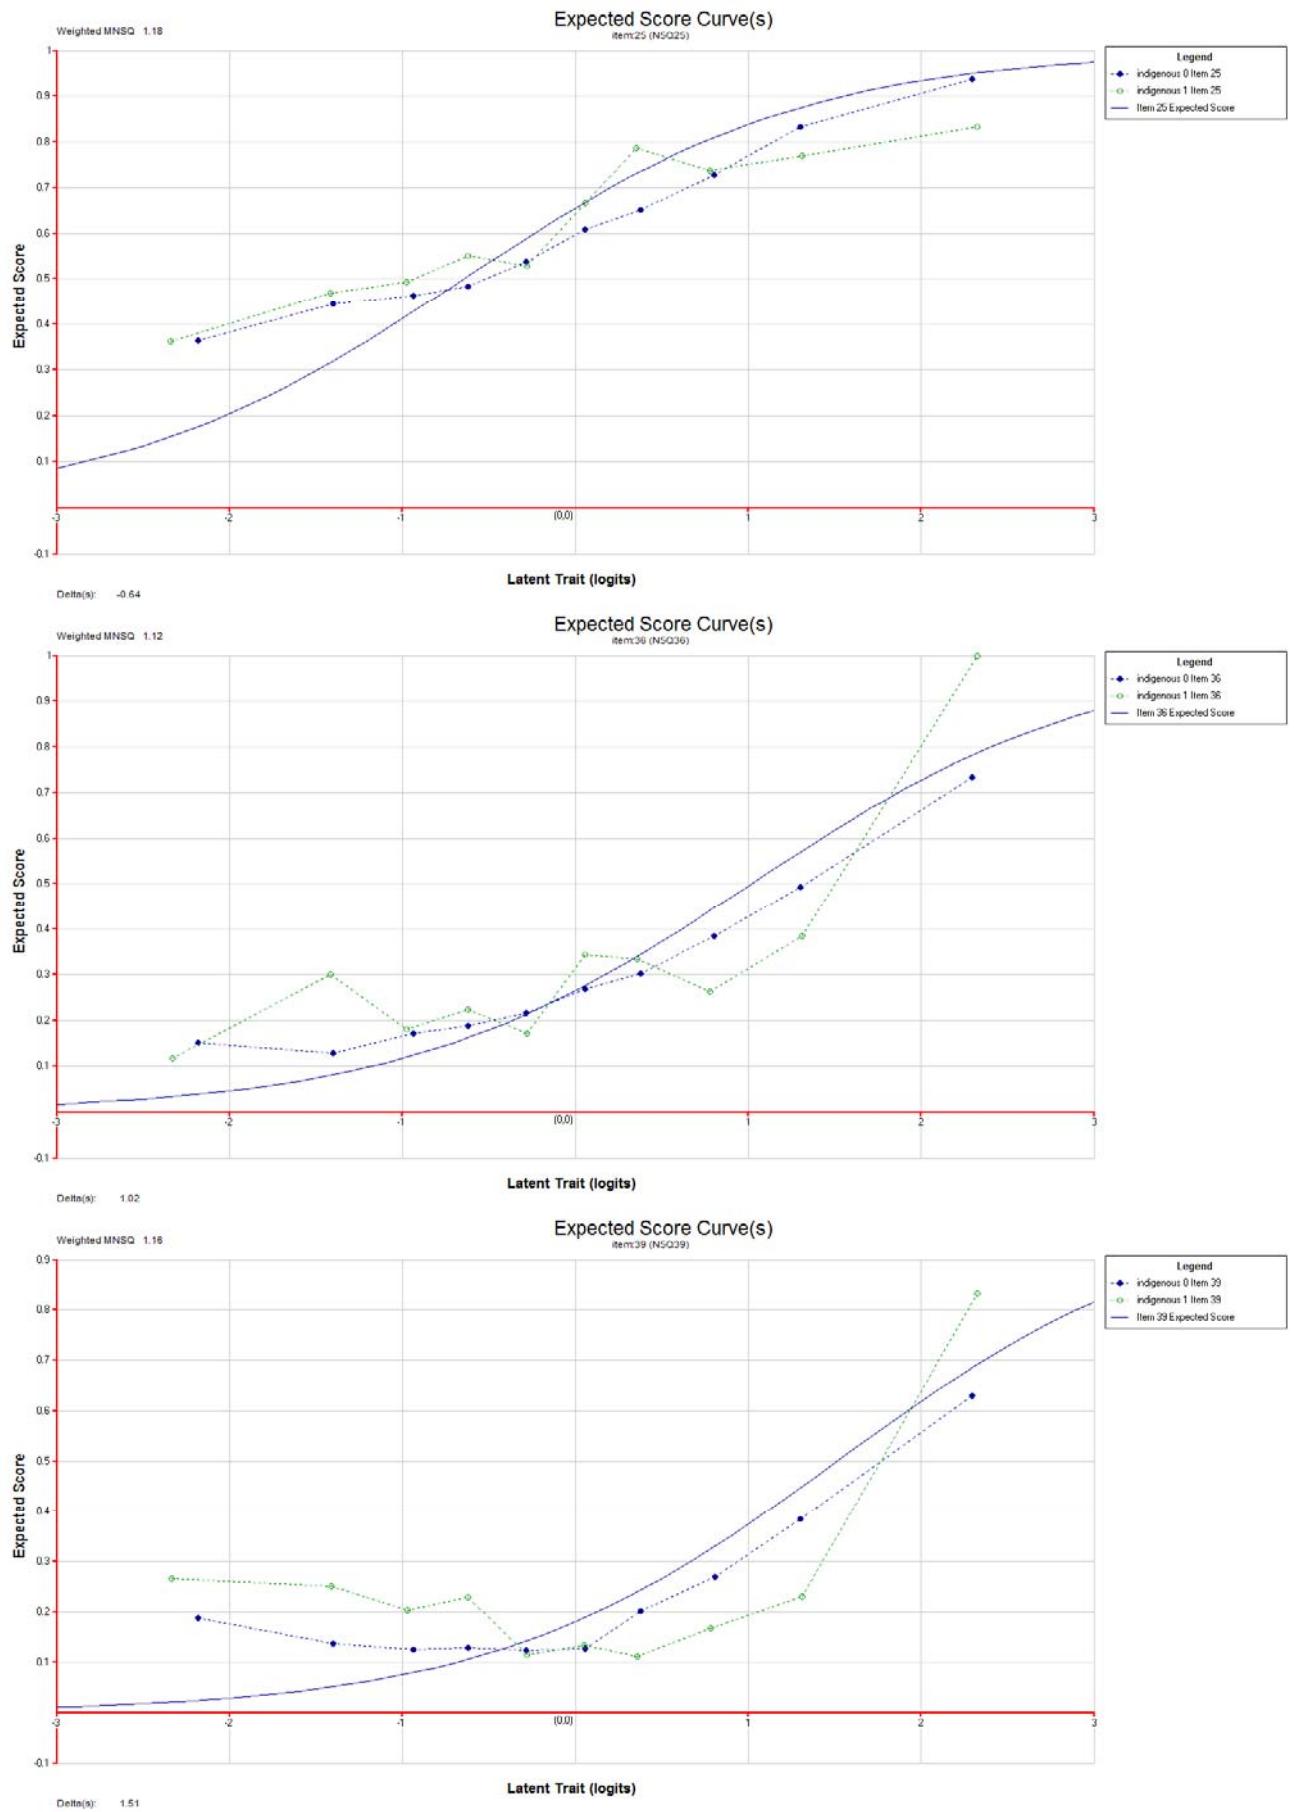

### H.6.11. Year 3 Numeracy

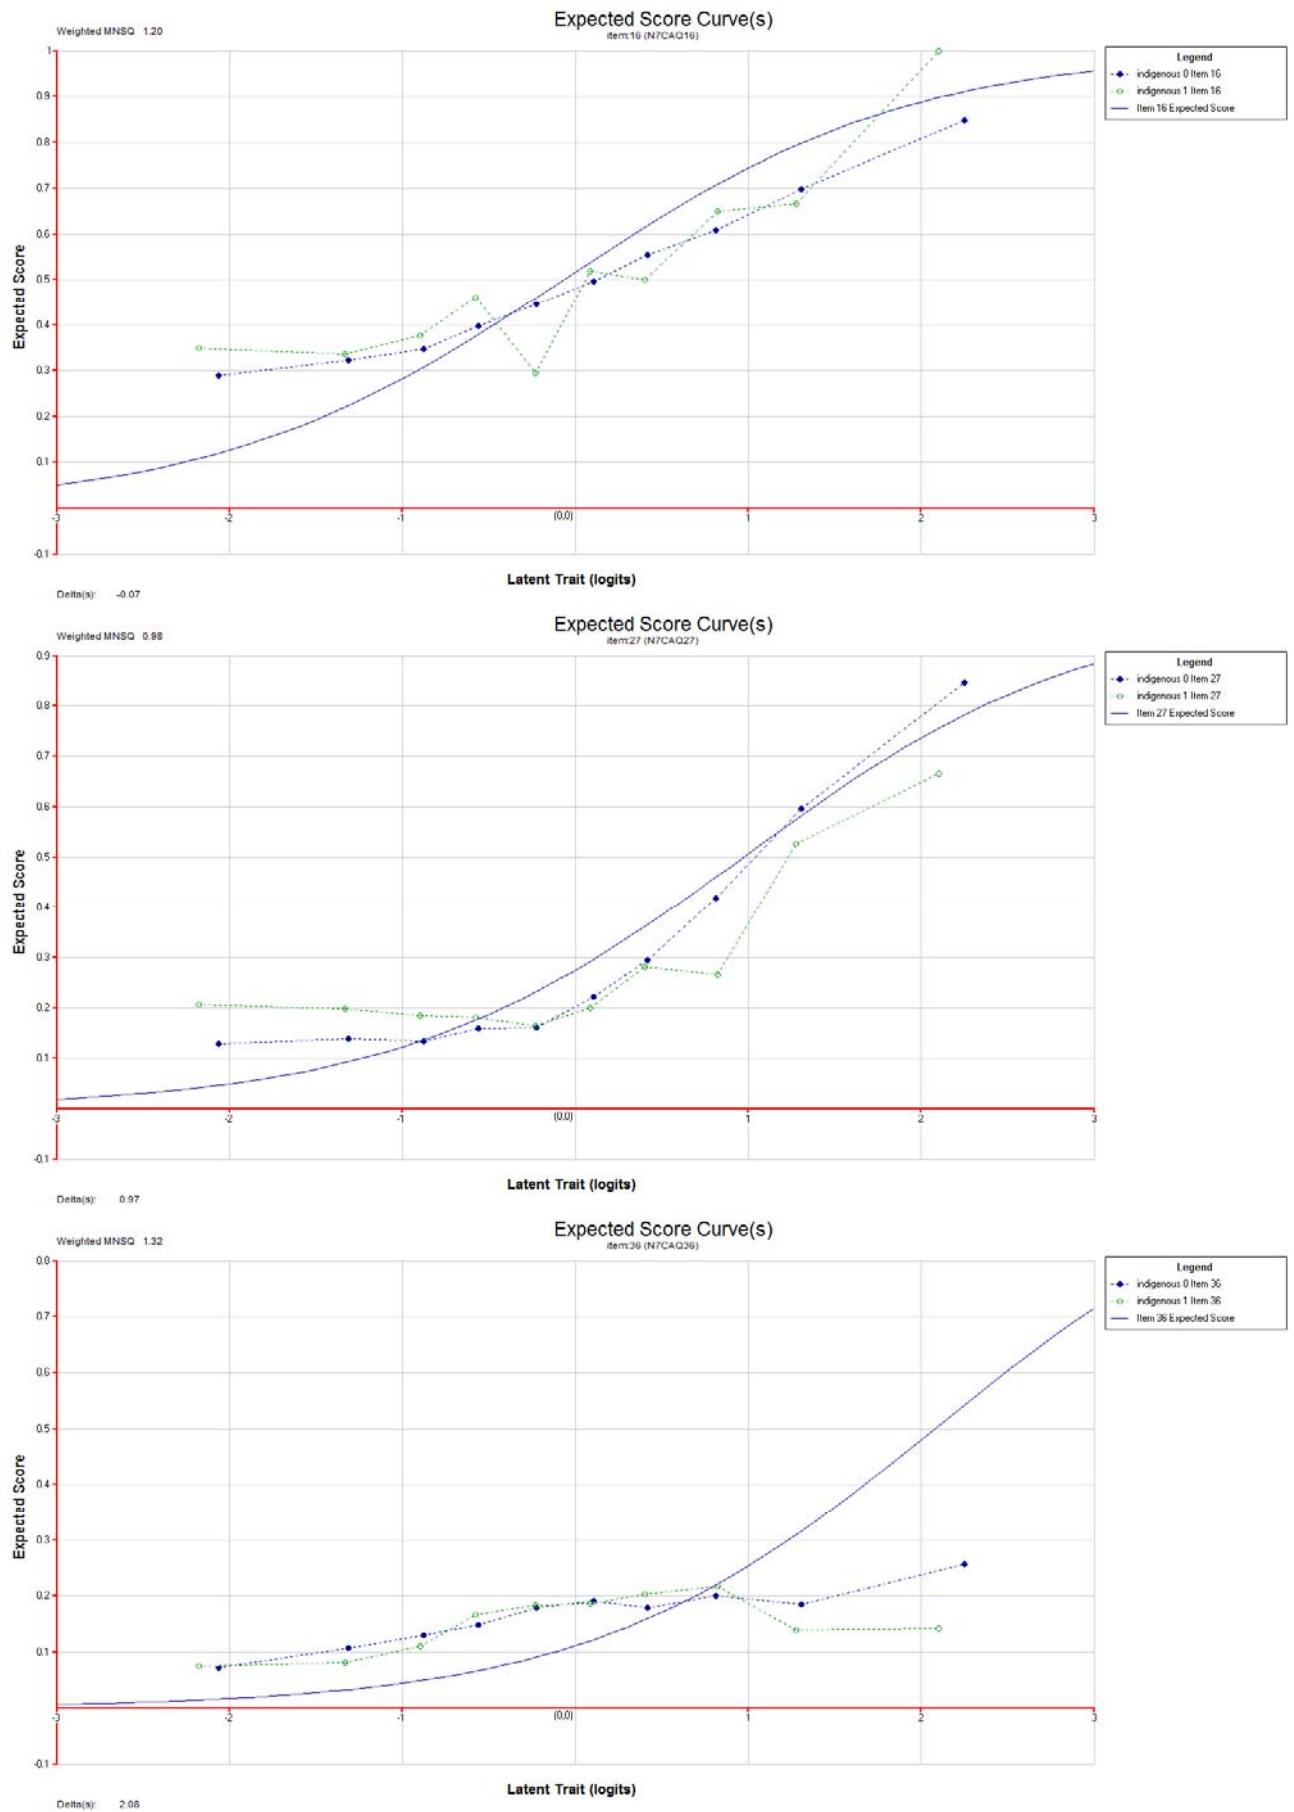

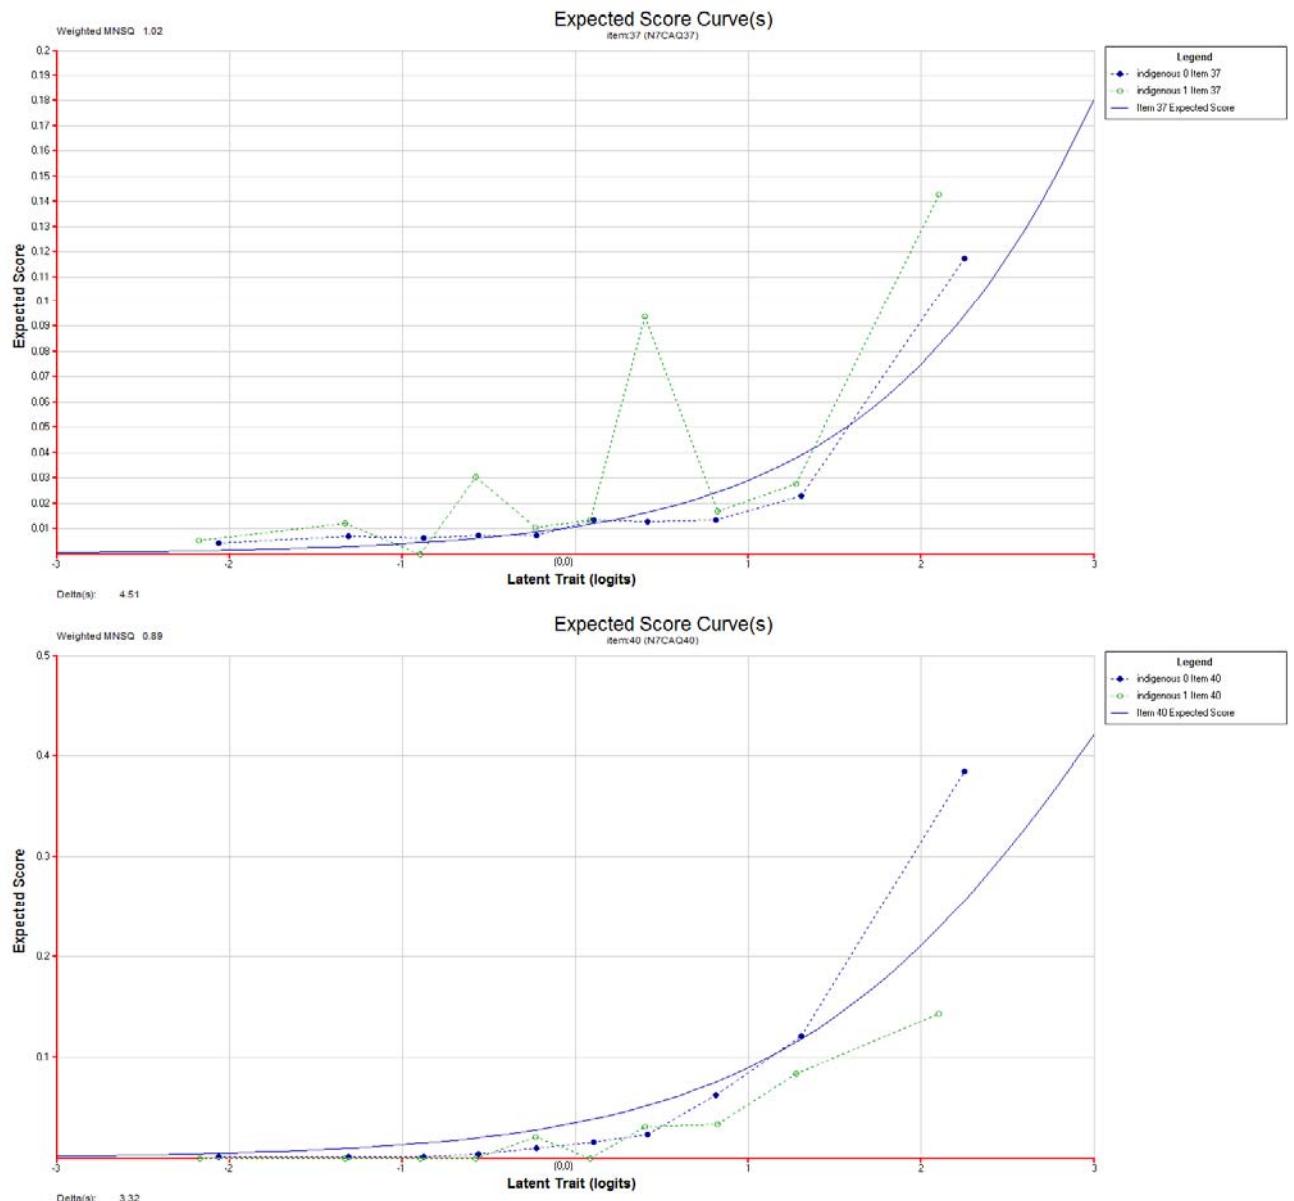

## H.6.12. Year 5 Numeracy

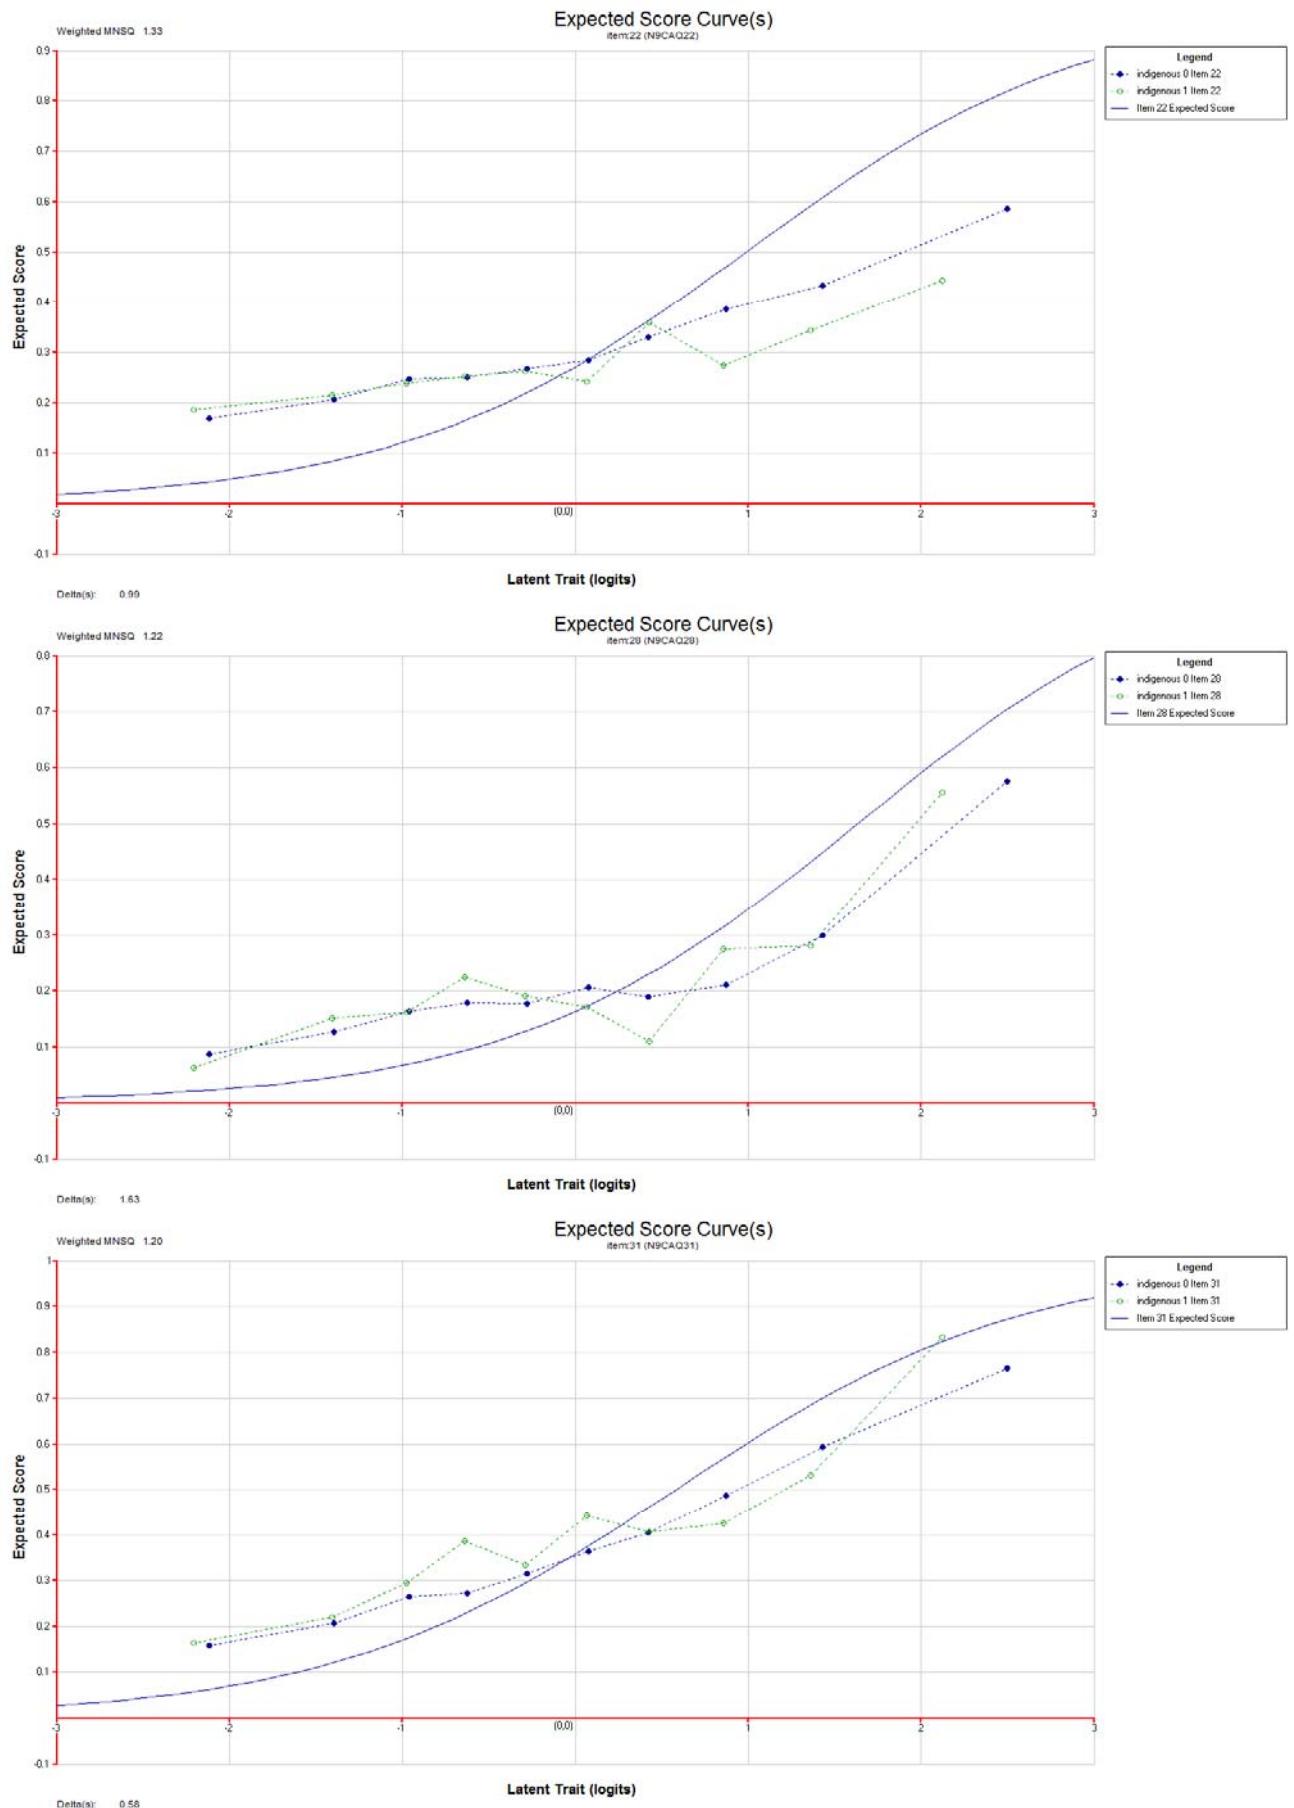

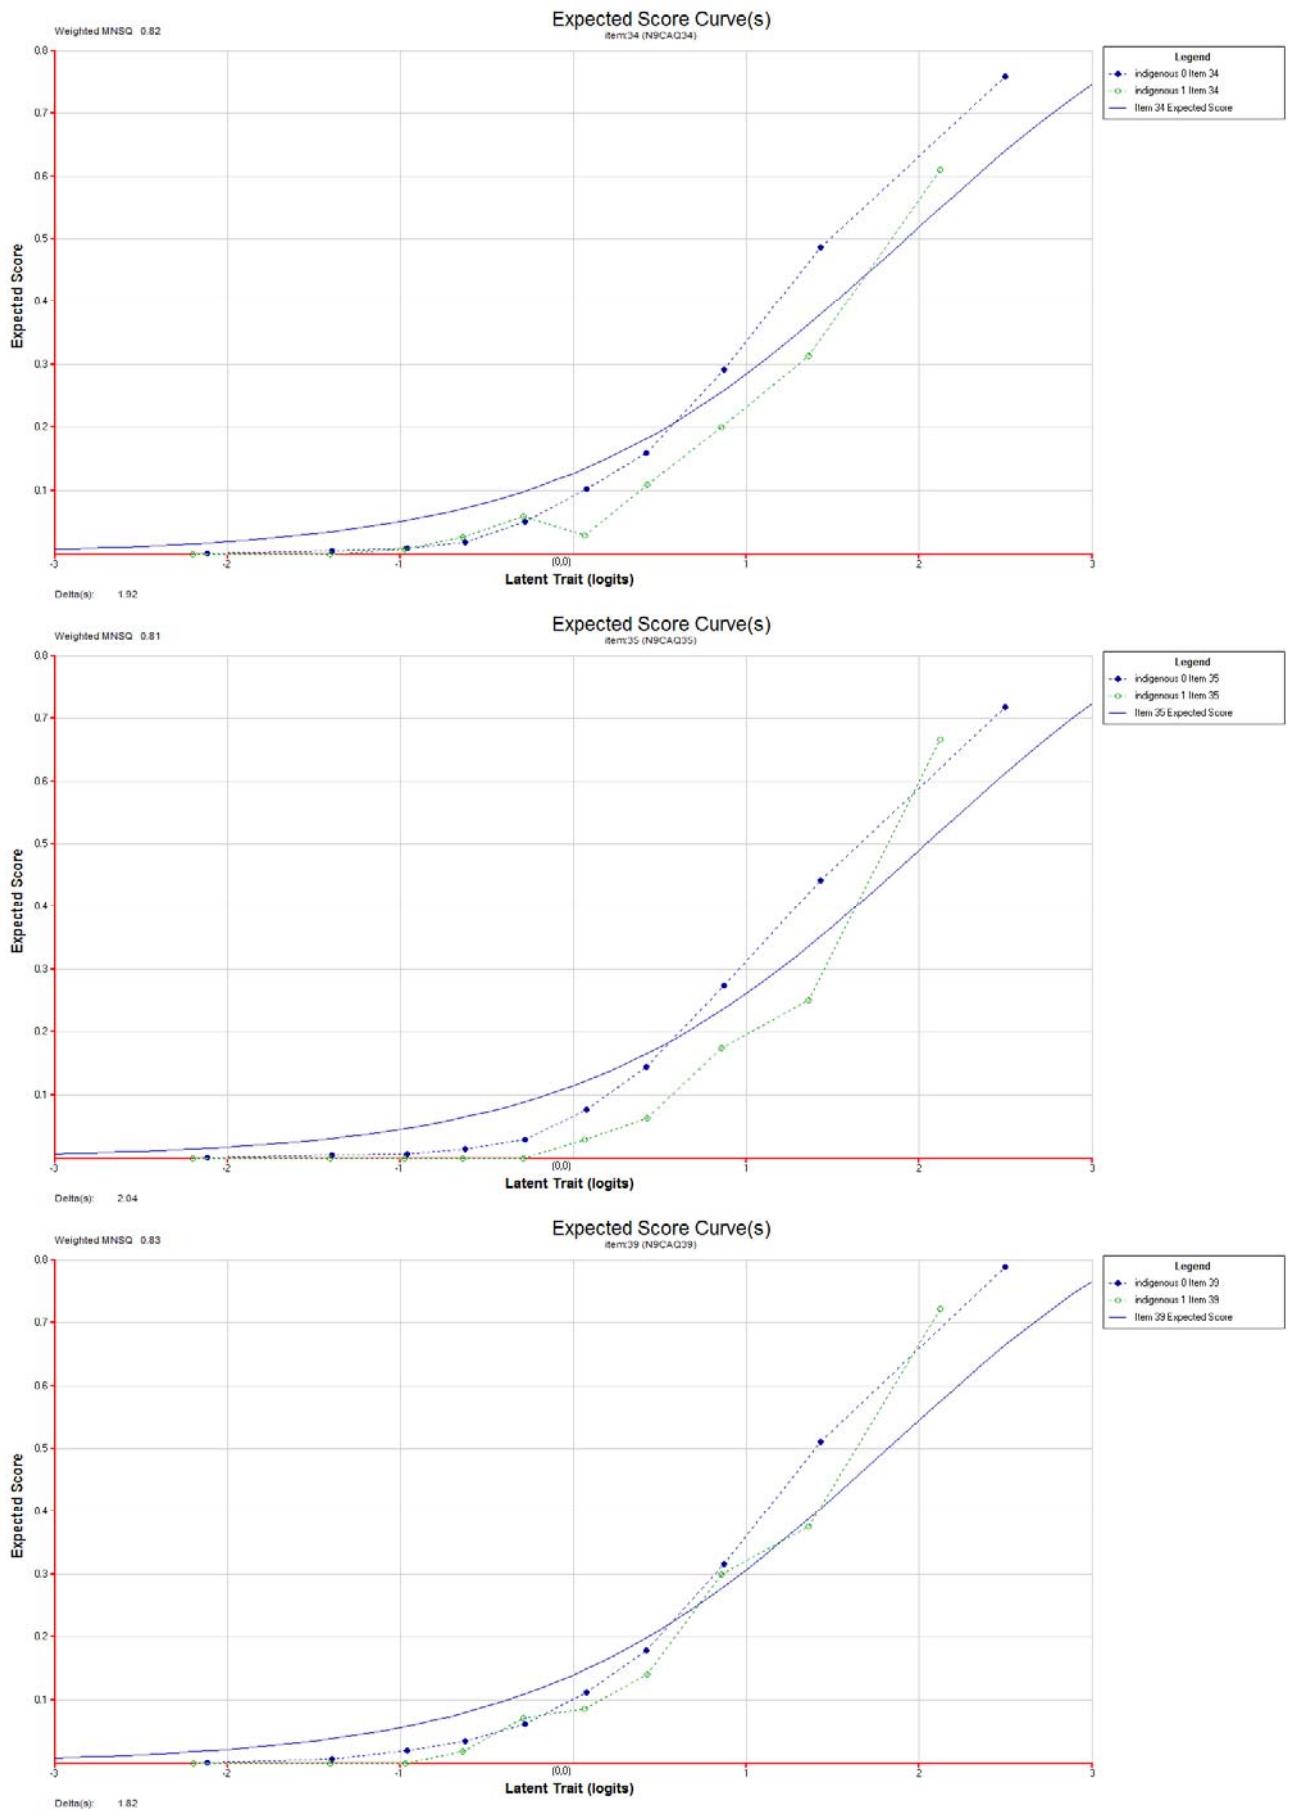

### H.6.13. Year 7 Numeracy

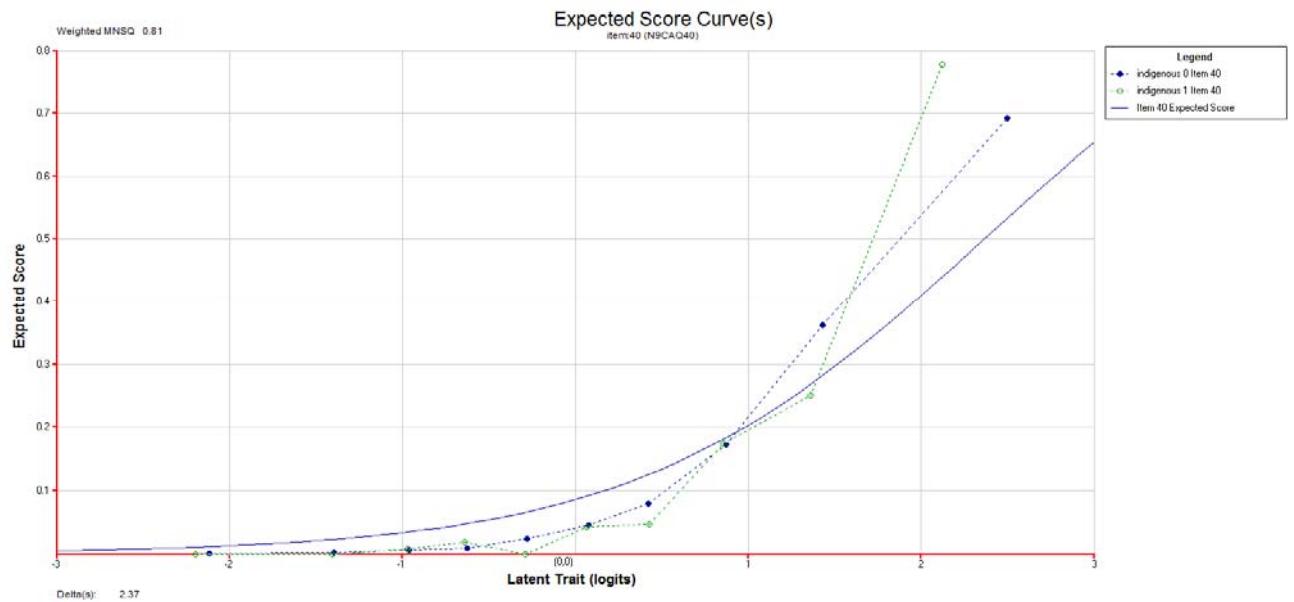

### H.6.14. Year 9 Numeracy

## **APPENDIX I. DIF BY DOMAIN BY YEAR LEVEL**

## **APPENDIX M. NAPLAN 2017 Writing Pairwise Equating Summary**

---

### **Pairwise Equating Verification**

As context, the following variations of tasks have been used in previous years.

- From 2008 to 2010, narrative writing tasks, single prompt
- From 2011 to 2014 persuasive tasks, single prompt
- In 2015, separate persuasive tasks for years 3 and 5 versus years 7 and 9
- In 2016, separate narrative tasks for years 3 and 5 versus years 7 and 9
- In 2017, separate persuasive tasks for years 3 and 5 versus years 7 and 9

Thus, in 2017 Persuasive prompts were administered to participating students and there were differentiated prompts for lower year levels and higher year levels. The equating verification study comprised the following key components:

- Pairwise comparisons of 2015 and 2017 scripts to obtain, if possible, a common scale based on the comparisons
- Cross-referencing pairwise locations for 2015 and 2017 with rubric-based locations for the same scripts

A decision has been taken to form a single Writing scale. Nevertheless, as context for interpreting the information it is useful to observe similarities and differences between genres. The Narrative and Persuasive marking guides contain overlapping criteria but also have differences which are summarised below:

- The first three criteria differ in being genre-specific (Audience, Text Structure, Ideas)
- The fourth Narrative criterion is Character and Setting whereas the fourth Persuasive criterion is Persuasive Devices (they have an equal number of categories)
- Paragraphing has a different number of categories
- Other criteria are the same—these include Cohesion and all conventions apart from Paragraphing

In previous years, identity equating had been employed. In 2017, there was again a very high correlation between threshold locations for 2015 and 2017 calibrations and the decision taken to treat the scale as the same.

The pairwise study design for writing in the NAPLAN 2017 assessment was essentially the same as that used in 2016. A group of 40 judges compared (i) 2015 scripts with other 2015 scripts, (ii) 2017 scripts with other 2017 scripts, and (iii) 2015 scripts with 2017 scripts. The 2015 and 2017 scripts represented performances on two differentiated tasks designed for year 3/5 and year 7/9 students.

The purpose of the pairwise study was to cross-check other sources of information in the equating of Writing. The design allows evaluation of whether, for a given scale location based on pairwise comparisons, a similar rubric score was predicted for 2015 and 2017 scripts.

### **Pairwise Study**

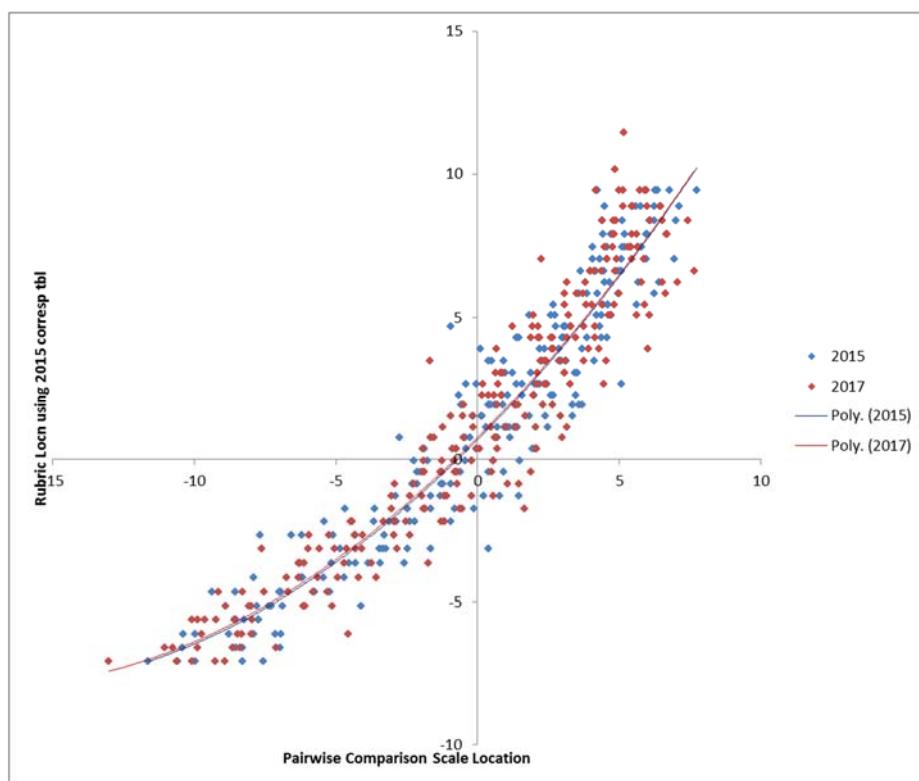

The purpose of the pairwise study is to obtain a common frame of reference by which to compare marking in 2015 with marking in 2017. The key focus is whether there is indication of a change in marker behaviour and trends, including but not limited to changes in harshness. It is noted that

prompts are selected in an attempt to minimise task-effects. It is also noted that exemplars are used in the Writing marking guide to help anchor score-points over time.

There were a total of 480 scripts of which 246 were from 2017 and 234 were from 2015. All scripts had rubric scores. Scripts were drawn by jurisdictions so that there was approximately a uniform distribution across most of the range of raw scores, with equal numbers for Year 3/5 and Year 7/9 tasks in the sample. A total of 35 judges from around Australia made a total of 21,818 comparisons. All judges but one had good Outfit indices (less than 1.2), the other being 1.7. Person Characteristic Curves were checked for each and every performance, showing acceptable fit across the range.

Figure XX shows the plot of pairwise scale locations (*x*-axis) against locations based on the rubrics (*y*-axis) for 2015 and 2017 separately. The linear correlation overall is approximately  $r = 0.940$  for 2015 scripts and  $r = 0.937$  for 2017 scripts. As can be seen, however, the curves are somewhat curvilinear as in previous years of the programme.

The pairwise scale locations show the ordering of the scripts based on direct comparisons whereas the NAPLAN scale locations are based on marking. In the plot, persuasive writing 2015 and persuasive writing 2017 are highlighted separately. The rubric locations for 2015 are based on the 2011 calibration, which continued to be used till 2015. The rubric locations (logits) for 2017 are based on the same correspondence table. Regression lines are shown separately for each of these years. It can be seen that there is a very similar correspondence between the pairwise and NAPLAN scale locations for 2015 and 2017 scripts. The correlation and nature of the relationship are relatively similar for both of these calendar years to the relationship in previous calendar years.

**Figure XX. Scatterplot of the NAPLAN and pairwise scale locations.**

Cross-referencing the pairwise locations with rubric locations indicates a high level of consistency in marking between 2015 and 2017. This evidence can be interpreted in combination with the high level of correspondence between threshold locations in 2015 and 2017.
